- Nov. 16 Iwo island. Twenty-three persons were killed when U.S. army transport crashed into sea 15 mi. from Iwo.
- Nov. 22 Near Locking, Eng. Eight R.A.F. members were killed and 30 others injured when bomber plane, diving for crash landing, sheared off upper deck of bus in which R.A.F. men were setting out on leave.

- Nov. 26 San Jose, Costa Rica. At least 23 persons were killed when commercial air liner hit mountainside near San Jose.
- Dec. 14 Near Manila, P.I. At least 12 persons were killed in crash of passenger plane.
- Dec. 23 Near Rio de Janeiro, Brazil. Twenty persons were killed in crash of commercial air liner, 30 mi. from Rio de Janeiro.
- Dec. 24 Laguna mts., Calif. Commercial air liner crashed on peak in Laguna mountains killing 12 persons.
- Dec. 25 Shanghai, China. At least 71 persons were killed when three Chinese air liners crashed near Shanghai in heavy fog.

Fires and Explosions

- Jan. 15 Welch, W.Va. Explosion in coal pit resulted in deaths of at least 14 miners.
- Jan. 28 Oklahoma City, Okla. At least 10 persons perished in fire of undetermined origin that swept through main hangar at army air force airdrome at Tinker field.
- Feb. 2 Garfield Heights, Cleveland, O. At least 13 persons were killed in fire that swept through home for aged.
- June 5 Chicago, Ill. Sixty-one persons perished in flames or were suffocated by smoke in fire that swept LaSalle hotel.
- June 9 Dubuque, Ia. Fire that started in basement of Canfield hotel, brought death to 19 people and injuries to a number of others.
- June 21 Dallas, Tex. At least 8 persons were killed and 41 others injured when exploding ammonia fumes from air-conditioning unit in basement swept through 700-room Baker hotel. There was no fire.
- June 25 Staten Island, N.Y. Estimated \$2,000,000 damage was caused by fire that destroyed ferry terminal; at least two persons were killed and several others injured in flames.
- July 18 Onset, Mass. Explosion of natural gas in restaurant cellar killed 9 persons and injured 60 others.
- Aug. 18 Vergarola, Yugoslavia. At least 43 persons were killed in explosion of mine dump on beach.
- Nov. 19 Greenville, S.C. Eleven persons were reported killed in explosion that wrecked laundry.
- Dec. 7 Atlanta, Ga. One hundred nineteen persons were killed in fire that swept Winecoff hotel; an estimated 100 more were injured.
- Dec. 8 Saskatoon, Saskatchewan. Roaring fire that started in hotel's restaurant raged through Barry hotel in matter of seconds, bringing death to at least 11 persons; 18 others were injured.
- Dec. 12 New York, N.Y. Collapse of huge wall of ice plant sheared off half of a neighbouring tenement, entombing and killing at least 38 residents of building.

Marine

- Feb. 4 Near Seward, Alaska. Passenger liner "Yukon" with 495 persons aboard, split into two sections after running aground in raging blizzard; coast guard reports indicated two dead and 31 missing.
- April 30 Leonardo, N.J. Ammunition blast that tore away one-third of destroyer "Solar's" forward structure resulted in death of five navy men.
- July 31 Rio de Janeiro, Brazil. About 27 persons died in fire that started in boiler room of Brazilian transport "Duque de Caxias" while vessel was at sea off Brazil; 1,600 survivors were brought to shore by Brazilian, U.S. and British rescue vessels.
- Aug. 2 Tanganyika, Africa. 295 persons were drowned in sinking of steamer "Vitya" in Lake Nyasa.
- Sept. 13 Off Cape Hatteras, N.C. Captain, his wife and 10 crew members drowned when Norwegian tanker broke in two during hurricane; 24 others of crew were rescued.
- Dec. 7 Off Toulon, France. French government officially abandoned hope for 18 men trapped in submarine believed sunk by floating mine.

Miscellaneous

- Jan. 12 Diamond Harbor, India. Collapse of two temporary jetties on Hooghly river resulted in death of estimated 100 pilgrims who were bound for site of ceremonial bath.
- March 9 Bolton, Lancashire, Eng. At least 33 persons were killed and 500 more were injured when guard rails in football stadium collapsed.

Natural

- Jan. 4 Eastern Texas. Thirty-three persons were killed by tornado that struck Nacogdoches and nearby areas.
- Feb. 13 Constantine, Algeria. At least 276 persons were killed in earthquakes that hit Setif and Batna regions in Constantine department.
- April 1 Alaska-Hawaii area of Pacific ocean. Series of tidal waves started off Alaska and Aleutian islands and spread to Hawaiian islands, causing about 150 deaths and leaving 5,000 persons homeless in Hawaii alone; damage was estimated in millions of dollars.
- May 28 Susquehanna valley, N.Y.-Pa.-Ohio. Susquehanna river flood, aggravated by heavy rains, caused widespread damage; 12 were reported dead and several persons were reported missing.
- May 31 Mus and Erzurum provinces, Turkey. At least 1,330 persons were killed in earthquake in eastern Turkey that levelled many villages.
- June 17 Detroit-Windsor. At least 14 persons were killed and many others injured by tornado that swept through U.S.-Canada border area striking Detroit and Windsor regions.
- Aug. 4-10 West Indies. Violent earthquake in northern provinces of Dominican republic brought death to at least 73 persons; heaviest shock accompanied by tidal wave occurred Aug. 4; minor tremors were felt in Puerto Rico, Haiti and Cuba.
- Aug. 16 St. Louis, Mo. Heavy floods brought about by record rainfall made 2,000 families homeless, caused damage estimated at \$2,000,000 and resulted in two deaths.

TRAIN WRECK at Naperville, Ill., on April 25, 1946, where the Burlington Exposition Flyer crashed into the rear of the Advance Flyer, killing 46 persons and injuring many more

- Aug. 18 Mankato, Minn. At least 7 persons were killed and 50 injured in tornado that swept through Mankato.
- Sept. 27 San Antonio, Tex. Heavy rains, inundating large sections of San Antonio, resulted in six deaths with four persons missing.
- Oct. 9 Off Portugal. Hurricane which swept over Madeira and Azores resulted in death of 27 persons.
- Nov. 3 India. Between 300 and 400 persons were killed in earthquakes that struck Muzaffarpur in Bihar province.
- Nov. 12 Philippines. Two hundred-sixty persons were killed in typhoon which struck Negros island, Manila dispatches disclosed.
- Nov. 13 Northern Peru. More than 500 persons were believed killed in series of earthquakes over 72 hr. in Andes mountain area; quake started Nov. 10.
- Nov. 15 Colorado. At least 18 persons died in two-week-period snowstorms (Nov. 2-15) that paralyzed communications over vast area in Colorado.
- Dec. 21 Southern Japan. Great earthquake which started six tidal waves, spread ruin over huge area of southern Japan; official figures indicated 1,088 persons dead, 165 missing, 142 injured and 94,669 left homeless; 21,846 houses were devastated, washed away or damaged.

Railroad

- Jan. 1 Lichfield, Eng. Freight train that telescoped into rear of passenger train at Lichfield station resulted in at least 15 deaths and many injured.
- April 25 Naperville, Ill. Forty-six persons were killed and 100 others injured when second section of crack express train, racing at speed of more than 75 m.p.h. ploughed into rear of first section, which had halted.

- Sept. 26 Near Victorville, Calif. Six persons were killed and 50 others injured in crash of crack passenger train.
- Nov. 12 Near Revigny sur Ornain, France. At least 35 people were killed and 80 others injured in train crash.
- Dec. 13 Near Mansfield, O. At least 18 persons, including 14 soldiers enroute to Japan for occupation duties, were killed in three-way crash of one passenger and two freight trains.

Traffic

- June 24 Snoqualmie pass, Wash. Bus carrying Spokane baseball team plunged off mountain road, 50 mi. east of Seattle, causing eight deaths.
- Dec. 18 Near Newberry, S.C. Ten school children and bus driver were killed when school bus crashed into train during fog.

Disciples of Christ. Statistics as of June 30, 1946, showed a total membership of 1,718,010 in the United States and Canada (Canada 8,982), a net gain of 16,982 for the year. Reported additions were about normal—52,904 by baptism, 51,393 otherwise—7,787 more than for 1945. There were 7,945 churches in the United States and Canada (a loss of 59), and 8,030 ministers (a gain of 582 after a loss of 324 the year before). Total world membership was 1,889,066 (up 21,475, after a gain of 21,760 for 1945). There were 11,660 members in Great Britain, 31,623 in Australia, 4,336 in New Zealand (losses of 441 and 899 and a gain of 9, respectively). South Africa reported 333 members. There was still no report from Poland, listed 3 years before as having 65 churches and (estimated) 40,000 members, and none from Denmark nor Norway. Receipts and expenditures for local church maintenance in the United States and Canada rose to \$23,157,449 (up \$2,247,914, after an increase of more than double that amount the previous year); for missions and benevolences \$9,941,051 (increase \$1,181,179). The foreign missionary agency, which had been able to continue its work in Africa, Latin America and India during World War II, made progress in resuming operations in the orient. Some missionaries had remained in China and most of the others had returned and were at work in the churches, schools, colleges and hospitals. Two missionaries sailed for Japan in December. All mission property was deeded to the native Japanese churches before World War II. There was also a resumption of work in the Philippines, especially in rebuilding and rehabilitation. The missionary magazine, *World Call*, as of Nov. 1, 1946, had a monthly circulation of 69,523 (up 9,124 in 1 year). The international convention (U.S. and Canada) met at Columbus, O., Aug. 6-11, with M. E. Sadler as president. It elected Rev. Hampton Adams, of St. Louis, as president of the next convention, which was to meet in Buffalo, N.Y., July 29-Aug. 6, 1947, in connection with the world convention of the Disciples of Christ.

Dixon, Thomas (1864-1946), U.S. author, was born on Jan. 11 in Shelby, N.C., the son of a clergyman. He studied at Wake Forest college, N.C., and Johns Hopkins university, Baltimore, Md., and received an LL.B. degree from the Greensboro (N.C.) Law school in 1886. He joined the state legislature at the age of 21 but resigned a year later to become a Baptist minister. Later, he wrote novels, most of which were devoted to preaching the "dangers" of racial intermixture of whites and Negroes. This was the theme of *The Clansman* (1905), a book which David Wark Griffith adapted to motion pictures in 1915 under the title *The Birth of a Nation*. Dixon was an eloquent defender of the Ku Klux Klan, which his father had founded. In the 1920s, however,

he denounced the second Ku Klux Klan as a bigoted organization and attacked its antagonism toward Jews and Christians but clung to his earlier convictions that the whites were "superior" to the Negroes. Among Dixon's other works are: *The Leopard's Spots* (1902), *The Traitor* (1907), *The Southerner* (1913), *Foolish Virgin* (1915), *The Black Hood* (1924), *The Love Complex* (1925), *Companions* (1931) and *The Flaming Sword* (1939). He died in Raleigh, N.C., on April 3.

Dodecanese.

A group of 12 islands in the Aegean sea. Area 1,035 sq.mi., pop. (1936) 140,848. Capital: Rhodes (27,466). As the inhabitants of the islands are in the large majority Greeks, the foreign ministers of the Big Four, in drafting the peace treaty with Italy during 1946, decided that the islands should be given to Greece. Article XII of Part I of the peace treaty draft with Italy stipulates that the islands shall be and shall remain demilitarized. The procedure and technical conditions governing their transfer to Greece was to be determined by an agreement between Britain, whose troops occupied the islands in the closing stages of World War II, and Greece, and the occupation troops were to be withdrawn within 90 days after coming into force of the treaty. (See also ITALIAN COLONIAL EMPIRE.)

(H. Ko.)

Doenitz, Karl

(1892—), German naval officer, was born on Sept. 16 in Berlin. Commissioned in 1913 as an ensign in the Imperial German navy, he served in a submarine division during World War I. Captured by the British in 1918, he was committed to an insane asylum. He was repatriated in 1919, but the suspicion prevailed that he simulated insanity to hasten his release.

After the Armistice Doenitz resumed his association with the German navy and it was believed that he assisted in the construction of U-boats and in training crews for them in violation of the Versailles treaty. He was chief of the U-boat force, 1939-43, and upon Erich H. A. Raeder's resignation he was made grand admiral and commander of the German navy in 1943.

In May 1, 1945, Doenitz announced the death of Adolf Hitler and declared that before he died the fuehrer had designated Doenitz as his successor. After Doenitz' efforts to surrender only to the western Allies were rejected by Gen. Dwight D. Eisenhower he ordered his envoys to sign the Allied unconditional surrender terms at Reims, France, on May 7, and at Berlin the following day. The Allies dissolved his government May 23, 1945, and arrested Doenitz, who was formally indicted by the international military tribunal at Nuernberg to stand trial on charges of war crimes. Doenitz was absolved by the court of charges of conspiring to wage aggressive war and of committing crimes against humanity; however, he was found guilty, Oct. 1, 1946, of crimes against the peace and violations of the customs of war and was sentenced to ten years of imprisonment.

Dog Racing.

Caught in the midst of an international betting fever, dog racing flourished in the United States and Europe during 1946. Record attendance and mutuel handle marked racing in Florida and Massachusetts. Top purse of the year was for \$10,000, contested in a series of matched races between Lucky Pilot and Flashy Sir on Massachusetts tracks. Ireland profited by the dog-racing craze in England by shipping 6,252 greyhounds during the first eight months of 1946.

Dominica: see WINDWARD ISLANDS.

Dominican Republic.

A West Indian republic occupying the eastern two-thirds of the island of Hispaniola or Haiti. Area, 19,129 sq.mi.; pop. (July 1945 est.), 2,029,054. Almost two-thirds of the population lives in the Cibao lowlands in the north; most of the rest lives in the vicinity of Ciudad Trujillo on the south coast. Racial distribution is estimated to be 15% white, 15% Negroes and 70% mestizo and mulatto. The capital is Ciudad Trujillo (formerly Santo Domingo) with a pop. (1946 official estimate) of 131,271. Other urban centres (with 1945 pop. ests.) are Santiago de los Caballeros (54,113), San Pedro de Macoris (22,728), San Felipe de Puerto Plata (15,610); additional cities (with 1944 pop. ests.) are San Francisco de Macoris (15,418), La Romana (13,814), Barahona (13,751), Baní (11,731), and Concepción de la Vega (11,683). Roman Catholicism is the predominant religion; the language is Spanish. President in 1946: Gen. Rafael Leónidas Trujillo y Molina.

History.—The government on Jan. 4, 1946, adopted a labour law establishing an 8-hour day and a 48-hour week for different categories of employees. Because of the alleged ambiguity of the law, restlessness resulted among labouring groups in later weeks. Sec. Gen. Trygve Lie of the United Nations announced on Aug. 1 that the Dominican Republic had paid its full assessment of \$12,250 to the working capital fund of the U.N. During the summer the government made elaborate plans for the celebration of the 450th anniversary of the founding of Santo Domingo (renamed Ciudad Trujillo in 1936) by Bartolomé Columbus in 1496. On the day set, Aug. 4, however, the country experienced its most serious disaster in many years in the form of a heavy earthquake, followed by a destructive tidal wave, in the northern part of the republic. The most seriously damaged cities were Santiago, San Francisco de Macoris and Puerto Plata, but the interior town of Moca (pop. 8,720) also suffered much damage and some loss of life, as did the smaller localities of Matanzas and Samaná. Recurrent but less serious shocks came in the two weeks following Aug. 4. The first quake was recorded on seismographs entirely around the world and was supposedly one of the most severe ever recorded. The government some days later, after an incomplete survey, reported a loss of life of at least 73, with 131 or more injured and 20,000 made homeless. Authorities immediately took steps, in spite of the serious interference with communications, to rush clothing, food and medical supplies to the stricken areas; additional assistance was furnished by U.S. naval vessels and others. Pres. Trujillo announced plans late in 1946 to introduce constitutional amendments providing for a central bank, establishment of a paper currency system, elimination of the foreign debt and other fiscal reforms.

Education.—Schools numbered about 2,000 in 1946, with an enrolment of more than 210,000 pupils; the total teaching staff was 3,439. The government began construction of a university city patterned after those in Colombia, Venezuela and elsewhere, at a cost of about \$2,500,000. The government claimed in 1946 to have reduced illiteracy by 10%, although it still presumably reached almost 60%.

Finance.—The monetary unit is the peso, valued at par with the U.S. dollar. The 1946 budget estimated revenues at 26,333,644 pesos and expenditures at 22,598,644 pesos; the budget did not, however, mention a pledged payment of \$3,000,000 to the international bank set up under the Bretton Woods agreement, to which the Dominican Republic adhered late in 1945. Total government collections in 1945 were 26,440,532 pesos, an increase of 5,493,399 over original estimates for the year. The government in 1946 authorized circulation of an additional 260,000 Dominican 10-centavo and 70,000 five-centavo pieces. Total U.S. Export-Import bank commitments to the Dominican

CHURCH OF SAN FRANCISCO DE MACORIS damaged by an earthquake which hit the town of San Francisco de Macoris in the Dominican Republic on Aug. 4, 1946

Republic, as of June 30, were \$2,200,000, all of it listed as amount outstanding. The Dominican government during the year took steps to float a 5,000,000-peso bond issue to finance 25,000 workers' homes.

Trade.—Exports in 1945 were valued at 43,564,113 pesos (1944: 60,269,328 pesos); the decline was largely caused by decreased sugar exports. U.S. exports to the Dominican Republic in 1945 totalled \$18,200,000 (1944: \$13,500,000) and imports were \$14,500,000 (1944: \$30,900,000). Dominican coffee exports in the crop year 1945-46 (Oct. 1-Sept. 30) were 10,471,985 kg. of green, 4,220,311 kg. of roasted and 3,520 kg. of ground coffee, valued respectively at \$3,103,028, \$1,933,734 and \$1,626. Approximately 67% of the coffee went to the U.S., 22% to Europe and 11% to other Latin American countries. Kapok exports in the first six months of 1946 were 38,978 kg. valued at \$5,925 (same period of 1945: 27,195 kg. valued at \$5,447). Straw hat exports in the first six months of 1946 were 26,292 units valued at \$8,573 (same period of 1945: 319,488 units valued at \$155,504). Quantities and values of certain other exports in the first eight months of 1946 (figures for the same period of 1945 in parentheses) were: cacao: 22,154,778 kg., \$3,544,022 (13,825,708 kg., \$2,273,916); chocolate: 775,621 kg., \$226,786 (926,392 kg., \$334,120); bananas: 910,779 stems (579,939 stems); plantains: 184,574 kg. (92,610 kg.). The United Kingdom contracted for the entire 1946 exportable sugar surplus. Most tobacco was marketed in Spain, Switzerland and the Netherlands.

Agriculture.—The estimate of coffee production for 1946-47 was 325,000 bags of 60 kg.; the 1945 crop was good but that for 1946 was estimated at only 43% of the 1945 crop. The 1945-46 rice crop, the largest on record, was estimated at 27,500 metric tons of paddy and 20,000 tons of highland rice; the price was expected to increase because of a government pledge of 10,000 tons to the United Nations Relief and Rehabilitation administration. The 1946 sugar crop estimate was 480,000 short tons. The government estimated that by the beginning of 1946, 123,000 ac. would be under irrigation. It took steps to establish a new degree-granting agricultural institute.

Donations and Bequests. U.S. philanthropy, having set new records in the World War II years, was maintaining a high level of giving, according to the annual study of giving made by the John Price Jones corporation of New York.

Citizens of New York, Baltimore, Boston, Chicago, Los Angeles, Philadelphia, St. Louis and Washington, D.C., the cities studied, gave or bequeathed \$275,853,339 to private philanthropy and organized fund-raising campaigns during 1946, a 31.32% increase over the \$209,306,297 contributed in these cities during 1945.

Further indication that U.S. people are philanthropic-minded and have a large amount of civic consciousness is shown in a study of fund-raising campaigns announced during 1946. During that year, 563 organizations publicly announced current or contemplated campaigns for total goals of \$1,821,020,194. Public announcements of amounts raised on some of these efforts show that the American Red Cross had received as of May 21, \$113,498,608, or 113.5% of its goal; the United Jewish Appeal raised \$102,000,000 surpassing its goal by \$2,000,000. In the United States and Canada 800 community chests had a combined goal of \$162,000,000 and as of Nov. 21, 244 chests reported raising \$75,672,824, or 98.4% of their goals. The National Foundation for Infantile Paralysis raised \$15,982,150 in its 1946 March of Dimes campaign.

The Presbyterian Restoration fund, seeking \$27,000,000 by May 1948, announced in December that \$18,191,271 had been contributed.

Gifts in the eight cities studied amounted to \$249,445,290 in 1946, compared with \$191,134,648 in 1945, an increase of 30.51%. Publicly announced bequests were \$26,408,049, a 45.33% increase over the \$18,171,649 announced in 1945.

U.S. interest in war projects and foreign relief in this first rehabilitation year was evidenced by the fact that the largest totals of gifts were as follows: \$55,832,280 for foreign relief; \$42,468,871 for combined community chests and war funds; \$33,237,013 for U.S. war organizations such as the U.S.O. and Red Cross.

Gifts in other classifications were as follows: education, \$37,583,544; organized social work, \$52,029,722; health, \$19,652,327; and religious purposes, \$6,616,825.

New Yorkers contributed \$135,296,487 in 1946, with the other cities as follows: Philadelphia, \$22,186,592; Boston, \$21,-

408,331; Los Angeles, \$17,188,017; Chicago, \$16,013,513; Washington, D.C., \$14,112,212; Baltimore, \$12,286,185 and St. Louis, \$10,953,953. (J. P. J.)

Great Britain.—Charitable bequests and donations to hospitals were noticeably lower in Britain in 1946 owing, it was believed, to a tendency to regard them as unnecessary in view of the coming inclusion of all hospitals in the national health service. There was also a tendency among testators not to name particular charities in their bequests but to leave the choice to executors. Thus Philip E. Hill, a financier who left an estate of £3,000,000 gross, arranged that his executors should dispose of three-quarters of it among unspecified charities.

The outstanding donation of the year was the official gift of a gold certificate for £985,000 and a bank draft of £196,625 handed to Clement R. Attlee, prime minister, by Field Marshal Jan C. Smuts in October as a present from the people of South Africa to the people of Britain, in admiration of their wartime spirit.

Properties given to the National Trust included George Meredith's home, Flint cottage, on Box Hill, Surrey; Charlecote, near Stratford-on-Avon, where Shakespeare was supposed to have poached; various small properties in the Lake district, and 250 acres of Hampshire which included Stockbridge down.

Charles Hopkins presented a house at Sevenoaks to Mrs. Winston Churchill as a tribute to her husband, and it was entrusted by him to the British legion under the new name of "Churchill house."

The duke of Montrose gave four of his largest pictures to the nation. They included an impressively large portrait, by Van Dyck, of Charles I riding on horseback through an archway at St. James's palace. (See also COMMUNITY CHEST; SOCIETIES AND ASSOCIATIONS.) (P. BN.)

Doolittle, James (1896—), U.S. army air officer, was born Dec. 14 at Alameda, Calif. During World War I he served as a flying instructor, and when peace came, he completed a course in engineering at Massachusetts Institute of Technology, Cambridge, Mass., graduating in 1925 with a doctor of science degree. He returned to active army service in 1940 and in Jan. 1942 was promoted to the rank of lieutenant colonel in the air corps. Doolittle electrified the world on April 18, 1942, during World War II, by leading a U.S. squadron of 16 B-25 bombers in a spectacular daylight raid over Tokyo. He was made a brigadier general and awarded the congressional medal of honour. Transferred to Africa, he was advanced to the rank of major general. On Feb. 26, 1943, he became head of the bomber command in the northwest Africa air forces and in the following December was named commander of the 8th U.S. air force. On March 14 Doolittle was nominated for the rank of lieutenant general. After the end of the war in Europe Doolittle and part of the 8th air force were assigned to the Pacific war, May 26, 1945. Shortly afterwards Doolittle arrived at Guam (July 23), but the war with Japan ended before he could fully employ the 8th air force in the Pacific area. On leaving the army, Jan. 1, 1946, Gen. Doolittle became president of the Air Force association and on March 18 he was named head of a board of former officers and enlisted men to investigate the army's caste system. The board published a report May 27, recommending elimination of many of the military terms emphasizing the differences in caste between officers and enlisted men.

Drugs and Drug Traffic. Misbranding of drugs in the United States was transferred, in large part, from the container of the medicine to less conspicuous types of labelling, such as circulars which were often brought together with the medicine only after they reached the dealers' shelves. A number of federal courts held this practice a violation of the Federal Food, Drug, and Cosmetic act. Another type of drug misbranding was through oral promotion by "health class" lecturers and "pitchmen" who recommended the preparation for serious diseases not listed in the labelling. Federal court actions against such practices were on the increase in 1946, while drug actions charging violations of the act were, as a whole, less in number than in the previous year. Actions against gadgets and contraptions misbranded with claims for serious diseases also increased. The diseases they purported to treat or cure included diabetes, cancer, tuberculosis, syphilis, arthritis and bronchial troubles.

Seizures of drugs standardized in the *Pharmacopoeia of the United States of America* and *National Formulary* were greatly reduced in 1946, largely because of the decrease in actions against injection drugs containing undissolved particles and of surgical dressings failing to meet sterility requirements.

The campaign was continued against the retail sale without prescription of drugs such as the sulfonamides, barbiturates and thyroid preparations, which were limited to prescription use only by the labels under which they were shipped. A federal district court upheld the government's criminal prosecution of a druggist who contested the case on the ground that the sulfathiazole he sold was not in interstate commerce at the time of the sale.

The fiscal year 1946 was the first in which the Food and Drug administration certified penicillin under the Food, Drug, and Cosmetic act, although it had, under a wartime agreement, maintained predistribution testing since the commercial production of penicillin began in 1943. Production of penicillin increased from 617,000,000,000 to 2,100,000,000,000 units in the 1946 fiscal year. Certification under the act was continued for insulin drugs, with 460 samples examined. Also under certifica-

PART OF OPIUM, WORTH \$2,000,000, being burned by Chinese officials at Peiping, China, on Jan. 26, 1946. The opium was seized from the Chinese puppet government set up by the Japanese

tion, through allocation orders of the Civilian Production administration, were all lots of streptomycin manufactured.

Among the new-drug applications were some representing the concentrated results of medical research for the armed forces, with information concerning them made available at the end of hostilities. Applications for the distribution of new drugs cleared in 1946 numbered 114.

Seizure actions against 324 drugs and devices were effected, 74 criminal prosecution cases were instituted and 7 injunctions were requested of the federal courts. (See also FEDERAL SECURITY AGENCY; FEDERAL TRADE COMMISSION.) (P. B. D.)

League of Nations and United Nations.—International narcotic controls in western Europe were being satisfactorily re-established except in Germany where considerable confusion resulted because of the quadripartite occupation. No uniformity was practiced in German zones, although some solution was brought about by a Working party consisting of the four governments in occupation. The solution to the problem was a co-ordinated effort to obtain the estimated medical needs for Germany for submission to the Permanent Central Opium board, but the Russian government refused to submit statistics to a board which had any League of Nations connections. This position was taken by the U.S.S.R. even though the Permanent Central Opium board was set up as an independent body under the 1925 convention.

Eastern Europe.—Yugoslavia again went into the opium market as an exporter. The postwar smuggling which was expected to develop from this part of the world had so far not materialized.

Near and Middle East.—Turkey was still the largest opium producer in the world for medical needs, and during 1946 produced an estimated crop of approximately 251 metric tons of opium, which is only 150 tons short of the world's medical needs. Iran ordered complete prohibition of opium production and went so far as to require that all government officials addicted to the use of opium must submit a certificate showing cure within 15 days from the date of the order. Afghanistan had previously banned the production of opium. Extremely large opium seizures in Palestine indicated a sizable addiction problem developing there. The seizures pointed to the fact that opium was being smuggled into Palestine from Iran and Turkey and was not being transhipped for smuggling elsewhere.

Far East.—India continued to be a source of illicit opium. Indian opium was being found in the illicit traffic in nearly every country where illicit opium was used. Portugal issued a decree declaring prohibition of opium smoking in Macao, which was formerly one of the worst spots in the entire world. This left Siam and India as the only places in the far east where the smoking and eating of opium was under government licence. Up to the close of 1946, prohibition was effected in Hong Kong, Straits Settlements, Malay States, French Indo-China, the Netherlands Indies and Macao.

Japan.—Complete controls with adequate penalties were set up under General Douglas MacArthur. Some 70,000 dealers of all kinds, including wholesalers, practitioners and druggists were licensed for the first time. Investigation developed a complicity on the part of the Japanese government in keeping its narcotic treaty obligations. Duplicate sets of records were found, one for their own use and one for the League of Nations. The indictment for war crimes contained a count charging violation of narcotic treaties and the poisoning of the Chinese population with narcotic drugs. Investigation developed that in one factory alone operating in Seoul, Korea, during the years 1938 and 1939, the Japanese government manufactured and sent to the Manchoukuo Opium Monopoly in each year an amount of heroin sufficient to supply the entire world's medical needs.

North American Continent.—Information from the army service forces of the United States showed that roughly 1 man in 10,000 selective service registrants examined for military duty was rejected primarily because of drug addiction. This indicated an impressive decrease in drug addiction, in comparison with World War I figures, when 3,000 were rejected in an army of 4,500,000 or one man in 1,500.

There was considerable clandestine cultivation of opium in Mexico.

United Nations.—The assembly in London adopted a Chinese proposal establishing a Commission on Narcotic Drugs consisting of 15 members representing the following nations: China, United Kingdom, U.S.A., U.S.S.R., France, India, Netherlands, Canada, Mexico, Turkey, Egypt, Iran, Yugoslavia, Peru and Poland. This commission was to report to the Economic and Social council. It convened for its first meeting at Lake Success, N.Y., on Nov. 27, 1946.

This was the first permanent commission set up under the United Nations and was to proceed to make recommendations without having to go through preliminary organization. During the meeting of the Economic and Social council, at which time a protocol was being considered for all nations to sign transferring all of the functions, powers and duties invested in the League of Nations under the international narcotic conventions to the United Nations, a Russian proposal was adopted that Spain be not permitted to sign the protocol as long as the Franco government was in power. Drunkenness: see INTOXICATION, ALCOHOLIC.

Duke University. A privately endowed institution at Durham, N.C., founded by James B. Duke in 1924. It includes Trinity college for men, which goes back in its origins to 1838, the women's college, the college of engineering, the graduate school of arts and sciences, the schools of divinity, law, medicine, nursing and forestry, and the summer session.

The development of the curricula at Duke university during 1946 showed two trends: (1) A revision of course offerings with a view to simplification and a return to fundamentals. The first two years of college tend to be devoted to basic work, whereas the last two years are given over to diversification and specialization. The departments of mathematics and physics illustrate this trend. (2) A revision of course offerings with a view to meeting the changing conditions of society. The departments of sociology, economics and history illustrate this trend.

An enlargement project was under way in the college of engineering, which had completely outgrown its plant. The new building, under construction in 1946, was designed to house more than 400 undergraduate students. It was to include the best in library facilities, stack space for 20,000 volumes, drawing rooms, blueprint rooms and reading rooms. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (R. L. Fs.)

Dunhill, Thomas Frederick (1877–1946), British composer, was born on Feb. 1 in Hampstead and was educated at Kent college, Canterbury and the Royal College of Music, London; the latter institution awarded him the Open Scholarship for Composition in 1897. In 1900 he became pianoforte professor at Eton. He was appointed to the staff of the Royal College of Music, London, in 1905 and founded the Thomas Dunhill concerts in 1907. His publications include a treatise on chamber music, 1913, and on Mozart's string quartets, 1927. His book on Sir Arthur Sullivan's comic operas appeared in 1928, and a work on Sir Edward Elgar in 1938. Among his compositions are the *Enchanted Garden*, an opera which won for him the Carnegie award in 1925; a comic opera *Tantivy Towers* (1931); a work for viola and orchestra *Triptych* (1942) and an overture *Maytime* (1944). He died at Scunthorpe, Lincolnshire, England, on March 13.

Dutra, Eurico Gaspar (1885–), Brazilian statesman and army officer, was born May 18 in Cuiabá, Brazil. He joined the army in 1902, and after studying at the Brazilian Military school in Rio de Janeiro (1904–08) he was commissioned in 1910 as a second lieutenant. Dutra became one of the leaders of the Brazilian officers clique and participated in the coup d'état that put Getúlio Vargas in the presidency in 1932. Dutra helped to crush the anti-Vargas revolt staged by Paulistas and in 1936 he was appointed minister of war. After Brazil declared war on the axis in Aug. 1942 the general, with the aid of U.S. equipment, organized and supervised the expansion of the Brazilian armed forces.

Vargas relinquished the presidency in Oct. 1945, after he had already announced that he would support Dutra's candidacy in the presidential campaign. Dutra won the elections held Dec. 2, 1945, and was inaugurated Jan. 31, 1946. In the summer of 1946 Pres. Dutra dismissed Brazilian Communists from government offices and shut down Communist newspapers that denounced the action.

Dyestuffs. The dyestuff situation in 1946 paralleled the 1945 pattern insofar as actual needs were concerned. The demand for civilian dyes, both for domestic and export consumption, far exceeded the supply. Reconversion began soon after V-J day and military-type inventories held by textile mills were taken over by the government and declared surplus property. The dye industry had to make extensive shifts in the relative importance of different dyes produced and despite the difficulties entailed by a change-over to a normal production basis, the problem was not considered insurmountable. The technical and mechanical changes involved were relatively simple, consisting largely of the realignment of equipment without large-scale replacements or alterations, but required time. The year 1946 held high promise for a closer approach by the textile and dye industries to a peacetime economy and conversion was well under way. Unsuspected obstacles presented themselves in the form of strikes in the steel and coal industries which prevented the dye industry from completing all of the major readjustments before the end of 1946. The supply of many raw materials was still insufficient to meet all requirements but it was considered to be only a matter of time before these shortages could be overcome. The industry would then be in a position to supply a wider variety of colours than formerly, since many dyes were developed during the war

which had previously been imported. U.S. dye manufacturers were also in a far stronger competitive position, their efficiency had reached a high level and new technical methods and processes were developed.

Restrictions on the use of dyes for civilian consumption were lightened early in 1945 and removed altogether the latter part of the year. The output of all types of dyes in 1945 amounted to 144,296,000 lb. compared with 151,651,000 in 1944 and the 1939-43 average of 142,515,000 lb. Sales of all dyes were 137,417,000 lb. valued at \$102,408,000 compared with 150,049,000 lb. valued at \$110,748,000 in 1944. Despite the substantial decline in the production of vat colours, this class continued to be the most important, accounting for 33.7% of the total 1945 dye production, direct dyes for 20.3%, sulphur dyes for 12%, acid dyes for 12.4% and mordant and chrome dyes for 5.9%. The remaining 15.7% was divided among the acetate rayon, basic, azoic and lake and spirit-soluble dyes. Production of direct dyes declined 545,000 lb., acid colours increased 699,000 lb. while sulphur colours decreased 681,000 lb. Sales of vat dyes other than indigo were valued at \$36,930,000, direct dyes at \$17,428,000, acid dyes at \$13,680,000 and sulphur dyes at \$4,239,000.

The dye industry in Great Britain, like that in the United States, strengthened its equipment and operating technique during the war. A vast program of expansion was formulated and commenced in 1946 which included larger plant facilities both in the United Kingdom and in other parts of the British empire. It was expected that this development would help make British dye consumers considerably less dependent upon foreign sources of supply and enable the empire to acquire a larger share of the overseas markets. Production figures after 1938 were not available in the year 1946. (A. G. BR.)

Ear, Nose and Throat, Diseases of. **Treatment and Training of the Hard of Hearing.**—This difficult problem as handled by the navy was discussed at great length and exactitude by Capt. Francis Lederer. The naval program of speech and hearing rehabilitation at United States Naval hospital, Philadelphia, is dedicated to the psycho-social adjustment of the handicapped person. It was planned to achieve within a 4-to 8-week period optimal retraining for communication, and by 1947 it had processed 3,000 aural casualties. Individual ear moulds had to be fabricated by especially trained personnel, hearing aids had to be tested by trial and error for each patient and it was of especial importance that correlation be made between audiometric and speech reception tests. A prospectus was outlined for three types of civilian hearing clinics—one for university centres, a second for metropolitan areas and a third for rural districts. Speech and hearing clinics should be a real boon to the hard-of-hearing patient.

Testing the Hearing of Newborn Infants.—In order to substantiate A. Liebmann's observation of 40 years ago that children were not born deaf, a study was undertaken to test the hearing of newborn infants. The audiometer could not be used, naturally, and tuning forks were found ineffectual, but the Urbantschitsch's whistles worked well. This set of whistles is comprised of 35 whistles, namely, 7 octaves, tones from Tr to F4. Of newborn infants 33 were tested, often with only 3 or 4 whistles; 31 reacted positively by turning the eyes or the head, or both, toward the source. The acoustopalpebral reflex (winking of the eyes) was the most frequent reaction. It was further suggested that the test be generally used in order to detect hearing impairments at an extremely early age, thus making it possible to introduce therapy as soon as possible.

Benadryl Therapy in Vasomotor and Allergic Rhinitis.—

Benadryl and pyrabenzamine antihistaminic drugs, were synthesized and used in allergic conditions in accordance with the concept that allergens produce on sensitized cells an effect causing liberation of histamine or histamine-like substances. It was given to 72 patients with allergic complaints; marked improvement or complete relief from nasal congestion and its associated symptoms occurred in 50% of the group with vasomotor rhinitis, and in 42.8% of the group with perennial allergic rhinitis. Only 4 of the 8 patients with associated asthma were definitely improved, with none of these obtaining complete subsidence of the thoracic symptoms and physical findings. One patient with pseudo-Ménière's syndrome obtained complete relief; another was not helped. In general, it may be said that benadryl would tide the patient over until the physician could further investigate and find out the real cause of the illness.

Miscellaneous.—Sinus surgery entered more and more into conservative channels. Antrum puncture with penicillin insertion by way of an in-dwelling needle was found to be of great benefit and would probably prevent many a future Caldwell-Luc operation on the maxillary sinus.

Surgery of the nasal septum was reviewed and improved by the Fomon group in New York. To overcome subsequent tension forces when a portion of the septum was removed, the resected septal cartilage or preserved cartilage was reinserted as a graft. Exceedingly accurate illustrations and sketches were shown in great detail. However, observation and training were necessary before the operation could be carried out to a successful conclusion.

East Prussia. Formerly the easternmost province of the German land of Prussia. Area 15,061 sq.mi., pop. 2,256,349. Capital: Königsberg, pop. (1939) 368,433. After the defeat of Germany in 1945, the U.S.S.R., the United States and Great Britain decided at the Berlin conference in 1945 that East Prussia should be divided between the U.S.S.R. and Poland. The southern part of the province was put under Polish administration, while the capital with its important port, the protected position of which fits it equally for military and commercial purposes, and the northern and eastern parts of the province were annexed to Russia. The city of Königsberg was renamed by the new government Kaliningrad, in honour of Mikhail Ivanovich Kalinin, chairman of the praesidium of the supreme soviet of the soviet union, who died in 1946. The important cities of Tilsit and Insterburg were also included in the territory annexed by Russia. The German population of the Russian and Polish territory was expelled and settled in the remaining parts of Germany.

At the end of Dec. 1946 the Russian government offered free transportation and housing to Russian farmers wishing to settle in East Prussia. At that time 149 schools with Russian instruction were opened for the new settlers (there had never been any Russian inhabitants in East Prussia) in the Russian annexed part of the province, and 30 schools with German instruction for the German population still there. The city of Friedland was renamed Pravdinsk, the city of Tilsit became Sovetsk and Insterburg was to be known as Chernyakhovsky

after the Russian commanding general who fell in battle in the conquest of the region. Pillau on the Baltic coast was renamed Baltiisk. Thus any trace of the 700 years' existence of Germans in a land in which Russians had never lived and which had never formed part of the Russian empire was radically eliminated. (H. Ko.)

Economic Association, American: see SOCIETIES AND ASSOCIATIONS.

Economic Development, Committee for: see COMMITTEE FOR ECONOMIC DEVELOPMENT.

Economics. During 1946 interest in economics centred in business cycles, taxation, international trade and the transition problems. Among private institutions the Committee for Economic Development issued substantial research reports in all of the fields mentioned during the year. Significant of probable long-run emphasis in the field of economic research, the committee scheduled an elaborate high employment study as its major subject for future effort. The Twentieth Century fund published a major study of international cartels. The Brookings institution issued studies of relief and social security policies, and of the securities markets.

The National Bureau of Economic Research published the second of its important major volumes on the statistical measurement of business cycles, and two additional volumes of the bureau's studies in income and wealth. The American Economic association released a collection of articles on income distribution, the third in its series of basic papers in important areas of economic thought.

Among government agency studies related to economic policy, the Federal Reserve board continued the release of its series on postwar economic problems. These included discussions of the relations of prices, wages and employment, private capital requirements, and the broad fields of housing, social security and

"HOW TO LET GO AND WHEN?" was a problem posed by Justus of *The Minneapolis Star* in 1946

public works. Significant studies were also made by the treasury on the economic effects of the corporation income tax, and by the bureau of agricultural economics on land use and farm tenancy.

Government agencies continued to make important statistical studies. Highly significant was the sample survey of liquid asset holdings, spending and saving published by the bureau of agricultural economics and the Federal Reserve board. As a pioneer study it was expected to be much used in studying the effect of cash balances, saving and spending on the level of economic activity. The bureau of labour statistics continued its studies in the measurement of productivity, and initiated a series of bulletins embodying the results of nation-wide surveys of wages and working conditions in important industries. The bureau of the census made available the results of the 1945 census of agriculture, initiated a series of current reports on service trades and continued its monographs on future population trends. Important for the future was the passage of the Agricultural Research and Marketing act providing substantially increased funds for research in problems related to the marketing of farm products.

The release of many professional economists from government and military service resulted in both an increase in quantity and an improvement in quality of professional publications in journals and books above the war years. While no outstanding contributions in either theoretical or empirical economics were made by individuals during 1946 much useful work was done on the economics of the firm, the uses of marginal analysis, the econometric study of business cycles and international trade.

Two developments important for economics occurred in the field of government action. One was the appointment of a three-man commission under the chairmanship of a professional economist, Edwin G. Nourse, setting in motion the terms of the Full Employment act. Because of the significance of the problems involved, recommendations of the commission would undoubtedly receive much attention from economists. The other was the actual organization and preliminary operation of the International Monetary fund and the International Bank for Reconstruction and Development projected under the Bretton Woods agreements. The influence of this action on economic discussion was already visible in the much greater proportional attention given to problems of international trade and finance than before World War II. (E.U.C.)

Economic Stabilization, Office of: *see* CIVILIAN PRODUCTION ADMINISTRATION; WAR MOBILIZATION AND RECONVERSION, OFFICE OF.

Ecuador. A west coast republic of South America, astride the equator, for which it is named. It is bounded on the north, east and south and west, respectively, by Colombia, Peru and the Pacific. Area, 104,510 sq.mi. (including the Galápagos Islands, a Pacific dependency, 3,029 sq.mi.); pop. (1944 est.), 3,171,367 (density of 30.35 per sq.mi.). Racial distribution is estimated at 60% or more pure Indian, 25% to 30% mestizo and at most 15% white. The capital is Quito (pop., 1944 est., 165,924); other important cities (with 1944 pop. est.) are: Guayaquil, the chief port (172,948); Cuenca (52,519); Riobamba (27,459); Jipijapa (22,097); Vinces (21,860); Chone (21,834); Ambato (21,692); Loja (20,776); and Latacunga (20,357). Ecuador has traditionally had a unitary government with a popularly elected president and a bicameral congress; a new constitution was being completed at the end of 1946. President in 1946: José María Velasco Ibarra.

History.—Turbulent political conditions were characteristic of 1946. The government on March 30 suppressed a revolution-

ary plot, with many arrests and the suspension of constitutional guarantees. Soon afterward the constitution, promulgated as late as March 5, 1945, was suspended and the government announced elections for May 26 for a new constituent assembly and elections on June 30 for a congress. Final returns for the constituent assembly indicated the choice of 33 Conservatives, 20 dissident Liberals, 6 independents, 2 dissident leftists and 1 Democrat; Communists, Socialists and Liberals refrained from voting. Although an attempted armed revolt by 60 civilians on Aug. 10 was aimed at preventing the assembling that day of the constituent assembly, the movement was easily suppressed and the assembly met on schedule. Velasco Ibarra immediately submitted his resignation as president but the assembly, dominated by the Conservatives, rejected it on Aug. 11 by a vote of 43 to 10, with leftist and centre parties abstaining from voting. Velasco was reinstated in office until 1948 and on Nov. 29 the assembly reaffirmed this action, continuing the president until Sept. 1, 1948. The assembly voted on Aug. 18 to end all military and political sanctions imposed after the 1944 revolution. The new constitution was reported completed Dec. 23.

The government on Jan. 6 signed a treaty of amity with China. Ecuador early in the year proposed the creation of a permanent conciliation commission for the American republics. On Feb. 1 the U.S. transferred its wartime airfield at Salinas to Ecuadorian authorities and on June 30 evacuated the military bases in the Galápagos.

Finance.—The monetary unit is the sucre, valued on Nov. 15, 1946, at 6.65 cents, U.S. The government on Feb. 2 approved the 1946 budget, totalling \$21,170,000. A considerable problem existed in 1946 over the available supply and the apportionment of foreign exchange. Total 1945 sales of foreign exchange exceeded purchases by \$4,000,000. The government fixed a quota for foreign exchange purchases for all purposes for the entire country for the first quarter of \$7,500,000 and imposed a tax of one sucre per dollar on exchange purchases; it was estimated that the tax would produce 30,000,000 sucres of revenue, 85% of which would be allocated to fomento (development) banks. A decree effective Jan. 1 required payment of seven days' wages for five and a half days' work; it was expected to be a disturbing factor in the labour market. The official cost-of-living index at the beginning of 1946 was 503 as against 100 for 1927. The government on Jan. 22 announced an Export-Import bank loan of \$780,000 for construction of the Pacific highway. Total Export-Import bank commitments June 30 were \$16,800,000, of which \$5,800,000 was the amount outstanding and \$11,000,000 the undisbursed balance.

Trade and Communication.—Exports in 1945 were valued at 378,000,000 sucres (a decrease of 19% from 1944) and imports at 324,000,000 sucres (decrease of 2%), leaving a favourable balance of 54,000,000 sucres. Exports of various products in 1945 included: coffee, 9,960,078 kg. (1944: 14,344,912 kg.) valued at \$2,350,100 (1944: \$2,526,383); cacao, 16,694,900 kg. (1944: 13,554,324 kg.); bananas, 693,652 stems (1944: 540,934 stems) valued at 2,871,759 sucres (1944: 1,897,921 sucres); oranges, 13,848,590 units (1944: 18,185,776 units); crude rubber, 1,968 metric tons (1944: 2,801 tons); kapok, 396,814 kg. (1944: 415,151 kg.); cinchona, 827,886 kg. (1944: 3,174,955 kg.), of which the U.S. took 820,862 kg. (1944: 3,172,471 kg.); straw (Panama) hats, \$5,167,368 (1944: \$4,895,929); crude petroleum, 279,278 metric tons (1944: 251,280 tons). Cacao exports in the first four months of 1946 were 6,100,352 kg. (same period in 1945: 6,114,564 kg.) valued at \$1,518,906 (1944: \$1,386,732); banana exports in the same period were 242,397 stems (1945: 126,020 stems). Balsa exports in the first seven months of 1946 were 1,888,705 kg. (same period in 1945: 5,538,094 kg.) valued at \$4,727,819 (1945: \$11,286,784). Imports from the

U.S. in 1945 were 55% of the total (1944: 52.5%); from Argentina, 10.4% (1944: 14%). Exports to the U.S. in 1945 were 58% of the total (1944: 57%); to Canada, 16% (1944: 18%). All restrictions on rice exports were expected to be lifted and the food commission headed by Herbert Hoover was told that Ecuador could export 500,000 quintals (quintal equals 101.4 lb.) of rice by September beyond previous commitments. Ecuador on Oct. 18 changed its 1936 commercial agreement with Chile to an unconditional and unlimited most-favoured-nation agreement.

Various plane companies serving Ecuador began or increased their services in 1946. The government contracted with a Swedish firm at the end of 1945 for installation of automatic telephone service in Quito and Guayaquil. On Sept. 22 it contracted with a U.S. firm for construction of 67.10 mi. of all-weather road between those two cities. The government gave consideration in 1946 to establishment of a joint merchant marine with Colombia and Venezuela, the plan advanced being to establish an intergovernment corporation with \$20,000,000 capital, subscribed 10% by Ecuador and 45% each by the other two countries.

Production.—The estimate of 1945 sugar production was 700,000 quintals (1944: 501,300 quintals). The government was attempting to make Ecuador self-sufficient. The 1945 estimates of coffee and rice production were, respectively, 350,000 and 1,400,000 quintals; the 1946 rice crop was expected to approach record proportions. The 1945 cotton estimate was 6,630 bales of 500 lb. (1944: 7,350 bales). Actual 1945 cacao production was 395,474 quintals (1944: 294,516 quintals). Crude petroleum production in 1945 was 2,622,724 bbl. (1944: 2,892,188 bbl.).

BIBLIOGRAPHY.—*South American Handbook* (1946); *The Inter-American* (monthly); *Foreign Commerce Weekly*; *Pan American Union, Bulletin* (monthly). (R. H. FN.)

Education. The two most serious educational problems of 1946 in the United States were (1) the provision of adequate facilities for the education of returning veterans in institutions of higher education, and (2) the continued shortage of teachers. Both problems were nation-wide and both brought to the fore the issue of federal aid for education at all levels.

Education of Returning Veterans.—At the annual meeting of the American Council on Education held in Chicago in May, General Omar N. Bradley announced that 1,687,000 veterans had applied for educational benefits under the G.I. Bill of Rights. These benefits included opportunities not only at the level of colleges, universities and professional schools, but for training on the job, in high schools and other approved institutions of less than college grade. In the last of these there was some concern about the quality of training that was given, while the job training program was criticized by the American Legion on the ground that the pay given to veterans was inadequate.

The most serious problem was raised, however, at the level of higher education. Many veterans were unable to gain admission to colleges, universities and professional schools. One reason for this was that the majority of veterans applied for admission to the larger or better-known institutions, particularly since the grants for tuition covered the fees charged everywhere, but generally because they were not familiar with the opportunities available in the smaller institutions. At a meeting of the American College Publicity association the establishment of a clearinghouse to provide information on these opportunities was suggested. In Minnesota such a clearinghouse was created in the state department of education. At the federal level an Inter-agency Committee on Veterans, representing federal agencies, was organized to handle all matters concerning the education and training of veterans—housing, opportunities for admission, collection and dissemination of information, the distri-

bution of surplus property, recruiting of teachers and discharge from the services of college and university teachers.

At the opening of the academic year, 1946–47, there was hardly any institution of higher education, except teachers colleges, whose facilities were not taxed to the utmost. There were shortages in housing accommodation, in classrooms and laboratories, and in teachers and textbooks. The housing accommodations were stretched to the utmost; trailer camps were set up and Quonset huts erected; institutions fortunate enough to be near discontinued housing projects established for war workers had the buildings transported. In some cases surplus real properties were acquired; Temple university in Philadelphia, Pa., purchased a structure used for the manufacture of aircraft parts; the state of New York was permitted by the navy department to establish a college at the Navy Training station, Sampson, N.Y.; the University of Connecticut was given permission by the U.S. maritime service to use part of Fort Trumbull, New London; the Naval Air station at Norman, Okla., was transferred, on a revocable permit, to the University of Oklahoma; the list could be expanded. The Federal Public Housing authority (FPHA) planned to dismantle surplus war housing and transfer 103,000 units, plus surplus furniture, beds and other equipment, to 675 colleges and universities; but by the middle of August only 11,000 units had been completed at college campuses, and 65,000 others were in various stages of construction. The institutions receiving the units were responsible for the preliminary work of preparing the sites, including the needed sewer, electric and telephone connections. The colleges and universities of New York city entered into an arrangement to have barracks at Camp Shanks converted to house 2,400 families and transport the students to and from the city by bus; only 246 units were ready by October.

The shortage of classrooms, laboratories and other facilities was met by the enactment of the Mead bill (S. 2085) under which congress appropriated \$75,000,000 to implement its provisions. The act authorized the Federal Works agency (FWA) to provide, as a temporary measure, for nonhousing needs from surplus and unused government structures, such as classrooms, laboratories, libraries, gymnasiums, recreation centres, cafeterias and dining halls, infirmaries and administration offices. These facilities were to be made available to public and nonprofit institutions if the U.S. commissioner of education certified, on the basis of information submitted by the institutions applying for them, that an acute shortage existed or impended to meet the need of educating veterans.

Not only were the institutions of higher education overcrowded, but all the numbers applying for admission could not be accommodated even in off-campus centres. Thus the University of Wisconsin established 34 centres in different parts of the state to give the first two years of college work; the University of Illinois acquired the use of the amusement pier in Chicago, used by the navy department, to provide instruction but not housing for about 4,000 students; the University of Maine established a centre for 800 students in Brunswick; the Pennsylvania State college extension services opened technical institutes in 13 centres. In New York state the problem created by the lack of a state university and the overcrowded conditions in the nonpublic colleges and universities was met by the establishment, on a temporary basis, of the Associated Colleges of Upper New York, consisting of Sampson college, located at the Naval Training station, Champlain college in Plattsburg and Mohawk college in the former Rhodes General hospital, Utica. Each college is affiliated with a number of neighbouring institutions, to which students may be later transferred on completing two years of work. Dr. Asa S. Knowles was appointed president of the Associated Colleges.

Below: CLASS AT A MILITARY PREPARATORY SCHOOL at Tula, U.S.S.R., in 1946; the lad in the front row, right, wearing the military ribbons on his chest, was adopted by a Russian infantry division which found him hiding in a forest after his mother had been killed by the Germans

No information was available in 1946 on the increase in the size of faculties, but additional instructors had to be secured in all institutions. Many, but not all, who had been on leave of absence for various services during the war returned to college teaching; in a number of instances high school teachers were appointed. In all cases the situation was met by largely increased size of classes and by repetition of courses to different classes during each week. According to a report of the U.S. office of education in November the total enrolment of students in 1,749 institutions of higher education was 2,062,000, of whom 1,073,000 were veterans and 667,000 were women. (See also VETERANS' ADMINISTRATION.)

The Future of Higher Education.—There was no doubt as the institutions of higher education prepared for postwar activities that a new stage was opening in their history. It was estimated early in 1946 that enrolments would reach 2,000,000 in 1949, and 3,000,000 some five years later. The first report on enrolments in 1946-47 indicated that the 2,000,000 mark had already been reached. The estimate was based on figures collected by Dr. Raymond Walters, president of the University of Cincinnati, for his report on college and university enrolments, published annually in *School and Society*. Reports from 450 typical institutions in all parts of the country showed marked increases in enrolments everywhere over 1939. In 256 independent colleges of arts and sciences the increase ranged from 40% to 279%; in 31 technological institutions, including engineering and agricultural schools, the range was from 15% to 125%; in 53 teachers colleges the range was from 5% to 580%, but it was inferred that many students enrolled in these colleges planned later to transfer to liberal arts colleges and not to prepare for teaching positions. Of the students enrolled it was estimated that 800,000 were veterans. It should be mentioned that the influx of veterans worked a hardship on recent high school graduates, many of whom found it difficult to gain admission to colleges immediately after graduation. In many colleges the number of high school graduates to be admitted was limited. The women's colleges had more applicants than they could admit. In many of the 600 junior colleges the enrolments doubled, and it was expected that the demand for the more varied types of courses offered by these institutions would lead to an increase in their numbers to 1,000.

The institutions of higher education were confronted not only with the problems of increased enrolments but also with serious financial problems. During the depression and war years their income had been reduced considerably by the drop in enrolments, lower yield in investments and diminution of gifts. (See report from the committee on education, house of representatives, *Effect of Certain War Activities upon Colleges and Universities*, Washington, 1945.) All were faced with arrears of building and other expansion. The postwar period began with increasing costs in every direction—operation and maintenance, supplies, and wages and salaries. To meet this situation most institutions raised the fees for tuition and board and lodging. Publicly maintained institutions raised tuition fees for nonresidents of the state or locality, and dormitory and incidental fees generally. It was estimated that the increase in student fees was from 15% to 30%. This move was stimulated not only by actual financial need, but also by the fact that under the G.I. Bill of Rights veterans were entitled to receive up to \$500 a year for tuition. The increases adopted brought the annual fees almost up to that sum. Women's colleges also fell in line and increased their fees, although their financial conditions had not been so seriously affected by the war as were those in men's and coeducational institutions.

Plans were already under way in 1946 to make up for the lag in building construction. A survey conducted by *School and*

Society and published in that journal, Oct. 26, 1946, showed that 182 institutions planned to spend \$601,928,000 during five years beginning in 1947 on new buildings, modernization of old and equipment. It was estimated on this basis that the 1,160 colleges, universities and professional schools of the country would spend about \$1,500,000,000 on building construction in the next five years.

In view of the increasing demand for education beyond the high school, a general survey of the whole situation was begun by a National Commission on Higher Education, appointed by Pres. Harry S. Truman on July 13, 1946. Dr. George F. Zook, president of the American Council on Education, was appointed chairman, and Dr. Francis J. Brown, director of the Division of Higher Education in the council, executive secretary of the commission of outstanding civic and educational leaders. Dr. John R. Steelman, director of war mobilization and reconversion, was appointed liaison officer between the executive agencies and the commission. The duty assigned by the president to the commission was "to re-examine our system of higher education in terms of objectives, methods and facilities, and in the light of the social role it has to play." In general, the commission planned to inquire into the question of expanding opportunities for higher education, the provision of courses in international affairs and social understanding, the need of intermediate technical institutes, and the financial structure of higher education. It was expected that the inquiry would ultimately bring up the issue of federal aid at the higher levels of education.

The absence of a state university in New York state and the charge of racial and religious discrimination in admission policies of nonpublic colleges and universities led to the appointment by Governor Thomas E. Dewey of a commission under the chairmanship of Owen D. Young to inquire into and report on the adequacy of existing facilities for higher education in the state.

Child Welfare: See CHILD WELFARE.

New Curricular Developments in Higher Education.—It was not clear whether the curriculum changes discussed and planned during the war years could be generally introduced because of the influx of veterans, whose special and more mature needs had to be met. New interests did develop, however, largely because of the international situation. At the meeting of the Mississippi Valley Historical association it was reported that record numbers of students were enrolling in courses in U.S. history, and it was urged also that greater emphasis be placed on world history to promote international understanding. Reports from all parts of the country indicated a widespread interest in the study of Russian language, history and culture. A number of institutions with grants from the Rockefeller Foundation organized courses in far eastern and Slavic studies. The experiments with the intensive language programs, conducted during the war, stimulated the adaptation of the same methods of language instruction in many colleges and universities. Another area in which there were important developments was in the study of international affairs.

To improve instruction and to stimulate research and creative activity in colleges and universities in the south, the Carnegie corporation of New York made a grant of \$700,000, to which the co-operating institutions were to add \$200,000 over a period of five years. The institutions were to be grouped around university centres in Nashville, New Orleans, Atlanta, and Duke university in Durham, N.C., and the University of North Carolina, which would serve as focal points to finance full or part-time research, purchase research materials and books for libraries and stimulate creative activity. At each centre a faculty committee was to select participants in the plan and a co-ordinator would serve as liaison agent between the centre and

STUDENTS jam Memorial hall, Harvard university, Cambridge, Mass., for registration in the fall of 1946. Veterans represented about 75% of the enrolment

the co-operating colleges and faculty participants.

Teacher Shortage.—The return to postwar conditions brought little or no relief in the supply of teachers. At the meeting of the National Education association, held in Buffalo in July, it was reported that 350,000 teachers had left the profession since 1941; and that 110,000 teachers, or 1 in 8 or 10 teachers would be employed in the school year, 1946-47, on emergency or substandard certificates. Since the enrolments in teachers colleges were from 20% to 50% below the numbers that could be accommodated, it was expected that it would take about ten years to bring the standards up to a desirable level. The shortage affected all parts of the country more or less seriously except in the east, but Maine sought a solution by inviting applications from teachers who had already retired from the larger school systems. The greatest shortage existed in rural areas and small village elementary schools; in the high schools it was difficult to secure qualified teachers in home economics, commercial subjects and physical education for girls. Enrolments in 179 teachers colleges had dropped from 90,000 women and 39,000 men in 1939 to 51,000 women and 13,000 men in 1946. In the liberal arts colleges in 14 states in the North Central association only 3,757 students planned to teach in elementary schools in 1946 as compared with 10,182 in 1941.

The problem of teacher shortage was discussed at a National Emergency Conference on Teacher Preparation, in Chautauqua, N.Y., in July; it was estimated that \$2,000,000,000 would be needed to secure an adequate supply of teachers, reduce the load of work, restore prewar school services and bring salaries up to a satisfactory level. The conference recommended the appointment by the National Education association of a National Commission on Teacher Education and Professional Standards. At its first meeting in September, the commission, under the chairmanship of Dean W. E. Peik, school of education, University of Minnesota, recommended that inexperienced teachers with four years of college training be paid minimum salaries equivalent to \$45 a week on a 52-week basis, with annual increases starting with the second year of service and rising in ten years to at least \$4,000 a year for college trained teachers. The commission also recommended reduction in the

size of classes. It was urged that school boards be made to realize that more money must be spent on education as on everything else, and that the alternatives were deterioration or regimentation. The commission planned a national campaign stressing the importance of the teacher for national effectiveness, and proposed the formation by state education associations of affiliated commissions on teacher education and professional standards.

The chief cause of teacher shortage was recognized to be the failure to pay adequate salaries to retain teachers in service and to attract new recruits. The rising cost of living, opportunities for employment in other vocations, and to some extent undemocratic systems of administration could not be left out of consideration. The National Commission for the Defense of Democracy through Education of the National Education association undertook a campaign to protect teachers and children against corrupt and politically controlled school boards. The unrest, however, was caused by inadequate salaries. The teachers of Paterson, N.J., staged a one-day strike for a cost of living bonus, while the teachers of Norwalk, Conn., refused for nine days to return to the schools in September because the local board of estimate and taxation had refused to appropriate adequate funds for salaries and to recognize the local teachers' association as the bargaining agency. The issue was settled through the intervention of Governor Raymond E. Baldwin and Dr. Alonzo G. Grace, commissioner of education, with the result that \$65,000 was appropriated instead of the \$90,000 demanded by the teachers. The teachers of St. Paul went on strike in November.

Salaries of teachers, principals and administrative officers had risen from an annual average of \$1,400 in 1940 to about \$1,700 in 1946, considerably below the increase in the cost of living in the same period; there were still many teachers who were receiving less than \$20 a week. There was a general movement to establish a minimum salary of \$2,400 a year, recommended by the National Commission on Teacher Education and Professional Standards and by the New York State Council of School Superintendents at its meeting in September.

Federal Aid.—The teacher shortage and the salary situation provided strong arguments, in addition to the many others, for federal aid for education. Some 30 of the 48 states, it was esti-

mated, could not meet the crisis without such aid. The inequalities in educational opportunities were presented clearly in graphical form in a brochure, *Unfinished Business in American Education; An Inventory of Public School Expenditures in the United States*, prepared by John K. Norton and Eugene S. Lawler for the American Council on Education and the National Education association. The report revealed the great variations in the expenditure on schools not only in different states but in each state, with a range from schools costing \$100 to schools spending \$6,000 or more per year per classroom unit, i.e., expenses for salary, books and instructional supplies, and maintenance. The average expenditure per classroom unit for the country was \$1,600. Such inequalities could only be removed by reorganizing education as a national concern and by pooling the nation's resources, that is, by federal aid.

No action was taken by the 79th congress on a bill to provide federal aid, strongly recommended in his budget message by President Truman, who stressed particularly that the federal government would not seek to dominate education in the states. The advocates of federal aid were, however, greatly encouraged by the organization of a bipartisan group in congress in favour of federal aid legislation. The existence of opposition from proponents of economy at any price and from supporters of private and sectarian schools was not ignored, but the outlook for federal aid appeared to be more promising in 1946 than at any other time in the history of the movement.

Cultural Co-operation.—The progressive expansion of government activities in the field of international cultural co-operation, which began in 1938, was marked by three important events. On July 30 President Truman signed a resolution of congress authorizing the United States to join and participate in the United Nations Educational, Scientific and Cultural Organization (U.N.E.S.C.O.). Since the adoption of the constitution of U.N.E.S.C.O. in London in Nov. 1945, U.S. representatives had participated in the work of the Preparatory commission, which was engaged in drafting the agenda for the first general assembly of the organization scheduled to meet in Paris in Nov. 1946. To implement the provision of the constitution that member states establish national co-operating bodies, a United States National commission of 100 members was created in September, consisting of delegates from 50 educational, scientific and cultural associations, 40 appointed by the department of state, and 10 from organizations selected at the first meeting of the commission.

The second event was the enactment by congress of the bill introduced by Senator J. William Fulbright of Arkansas authorizing the department of state to use some of the proceeds from surplus property sales abroad for the exchange of students and other educational activities. Under the provisions of the act grants were to be made to foreign students to study in U.S. institutions of higher education, to U.S. students to study abroad, and to U.S. professors to lecture in foreign universities. Without the benefit of this act foreign students, whose number in 1946 was estimated to be about 10,000, had already entered U.S. colleges and universities, many of them on scholarships granted by their own governments.

The third event was the concentration of all cultural activities conducted by the government in the department of state. It was expected, however, that co-operation between the department and voluntary agencies in the field of international cultural relations would be continued. A new voluntary agency, the World Organization of the Teaching Profession, was established following a conference of representatives of teachers' associations from 30 countries, convened by the National Education association at Endicott, N.Y., in August.

Finally, the interest of the United States in promoting demo-

cratic systems of education in former enemy countries occupied by U.S. troops was indicated by the appointment of two education missions, one sent to Japan in March and the other to the U.S. zone in Germany in August. Both missions submitted reports for the reorganization of education in the two countries. (For statistics of institutions see UNIVERSITIES AND COLLEGES.)

BIBLIOGRAPHY.—*Higher Education*, published by the United States Office of Education; *Higher Education and National Affairs*, published by the American Council on Education; *Journal of the National Education Association* and *School and Society*. (I. L. K.)

Great Britain.—In face of difficulties, because of the universal shortage of manpower and materials, government departments, local education authorities and teachers were steadily if slowly laying the foundations necessary to implement the Education act, 1944, and the Education (Scotland) act, 1945. In Jan. 1946 a small Education bill for England and Wales was introduced into parliament, and in May this became law as the Education act, 1946. An amending measure only, it did not affect the main structure of the 1944 act, its purpose being to clarify rather than alter the law.

The local education authorities in England and Wales found the task of completing their "development plans" (for primary and secondary education) by the appointed date of April 1, 1946, beyond their power. In March the minister of education granted them leave to apply for an extension of up to three months, or longer in exceptional circumstances. By the end of the year approximately two-thirds of the authorities had submitted complete plans: the ministry estimated that in the aggregate they would involve £700,000,000 to £800,000,000 of capital expenditure.

The proposal, embodied in the plans of many county authorities, to close large numbers of small village schools raised a controversy. The principle of the concentration of pupils of secondary school age had long been accepted, but the idea of transporting children between the ages of 5 and 11 away from their home village aroused strong opposition in many districts, as did that of denuding a village of what often is in effect a community centre.

Practically no school building of a permanent nature was yet possible. In preparation for the raising of compulsory school age to 15 on April 1, 1947, and the large-scale provision of mid-day meals at school, the ministry of works erected prefabricated huts as annexes to existing schools; and to meet exceptional needs a few "light-permanent" buildings were erected. Both tasks were sadly hampered by prevailing shortages, and it was doubtful whether, particularly in Scotland, sufficient accommodation for the raising of the age would be everywhere available by the appointed day.

In accordance with the terms of the Family Allowances act 1945, the provision of milk in schools became free on Aug. 6, 1946, but the provision of free meals was deferred until sufficient school canteens became available to make it a nation-wide service. Canteens were being erected at the rate of over 1,000 a year and already served more than two-thirds of the schools in 1946.

The emergency scheme for the training of teachers in England and Wales was also held back by delays in adapting buildings. There was no lack of suitable candidates for training, but most of those accepted had to wait 12 to 18 months before entry into college. It had been hoped to have 10,000 students in training by the end of 1946, but by November only 6,500 were accommodated. In Scotland room was found in the permanent training establishments for all emergency courses, and no candidates had to wait. New regulations governing the training of teachers, made in Feb. 1946, provided that all recognized students should receive free tuition, while charges for board and lodging would be scaled in accordance with the student's means. Exchanges

between teachers of the U.S. and Great Britain began again in 1946. In August, 74 British teachers, representative of all types of primary and secondary schools, sailed for the U.S., while 74 U.S. teachers took up appointments in Britain. In July Ronald Gould was appointed to succeed Sir Frederick Mander as general secretary of the National Union of Teachers. Mr. Gould was president of the union in 1943-44.

In May 1946 the ministry of education proposed radical changes in the first and second school examinations (the school certificate and the higher school certificate) taken by secondary schools; the school certificate was to become an internal examination, with external assessment, and the higher school certificate to be divided into two, for the purposes respectively of university entrance and the award of university scholarships. No immediate action was planned; the proposals were referred to the Secondary Schools Examinations council for consideration.

In Jan. 1946 the Carnegie United Kingdom trust set up a Bureau of Current Affairs to perform for civilian adult education services comparable with those offered to the forces by the war-time Army Bureau of Current Affairs (ABCA). In May a National Foundation for Adult Education, representative of statutory and voluntary bodies, was established. In December the minister announced that national committees had been established to advise on and produce educational films. In August the fields of responsibility for agricultural education were newly delimited. The ministry of education was made responsible for it in primary and secondary schools and farm institutes, and for providing courses for "domestic (*i.e.*, nonprofessional) providers." The ministry of agriculture had charge at university, college, and professional levels. In September the ministries of labour and education began to co-operate in a scheme of education and training for potential business executives. In March the directorates of army education and the Army Bureau of Current Affairs were combined under the director of army education, and in June the air council approved the formation of an education branch of the royal air force, which came into being on Oct. 1.

In Sept. 1946 an Education bill for Northern Ireland was introduced into the Ulster parliament, in October given a second reading and in November and December passed through the committee stage. This bill, which gave effect to the proposals for reform outlined in the White Paper on *Educational Reconstruction in Northern Ireland* published in Dec. 1944, was markedly similar in its main structure to the Education act, 1944. It provided for a statutory system of education in three progressive stages; secondary education for all, with the raising of compulsory school age to 15, and later to 16; free milk and meals at school; medical inspection and treatment; compulsory religious instruction and worship, and the registration of independent schools. Compulsory part-time education was not, however, included, though envisaged as a future possibility.

Eggs. The production of eggs declined slightly in 1946 from the level of 1945 and the record of 1944. The total for 1946 was estimated by the U.S. department of agriculture at 4,950,000,000 doz. compared with 5,060,000,000 doz. produced in 1945 and a prewar average of 3,335,000,000 doz. in 1935-39. Egg production during the first ten months of 1946 was about 2% below the level of 1945 because of about 2%

reduction in the average number of layers during the period. The number of chickens on farms on Jan. 1, 1946, was 525,536,000 birds compared with 510,939,000 on Jan. 1, 1945, and the high record of 576,441,000 in 1944. Egg production in 1946 was favoured by good weather and was above 1945 in all parts of the country except the south Atlantic and south central states where it was about 5% lower. Egg production per hen averaged 9.2 eggs in October, the highest on record for the month compared with an average of 7.7 eggs. The rate of laying was below the level of 1945 during the first half of the year. The average egg production per hen made a high record of 118 eggs in 1945 but dropped off to 114 in 1946. Feed supplies were tight during the early part of the year but were relieved by the good grain crops in July. Farmers culled flocks sharply in early spring and commercial hatching was lower than in the previous few years from May to July. With more feed available production was increased during the fall when prices were high.

Prices of eggs were supported by the strong demand for meat substitutes in early 1946. When price ceilings on meats were removed in July the price of eggs increased slowly and chicken prices declined 20%. From a level of around 40 cents per dozen in Jan. 1946 egg prices declined during the spring and then rose to 33 cents per dozen in July, and on to a high of 51.5 cents in October. Then followed the usual fall decline to 47 cents in December. Prices during 1946 were lower than in 1945 until August when price control ended. They were about double the average of 1935-44, and the highest after 1920.

Stocks of shell eggs increased rapidly during 1946 much above both the level of 1945 and the average. Frozen egg production was high until May when it dropped below the rate of 1945 and the war average 1940-44. The end of World War II put an end to the hope of a large export market. While the demand kept up through 1946 it was expected to drop in 1947 to the prewar level of about 2% of U.S. production. Poultry production in European countries was being rapidly restored. From 1941-45 about 11% of U.S. egg production was exported, two-thirds to the United Kingdom and one-third to the soviet union. Government purchasing of eggs declined sharply in July and the buying of frozen eggs for export was terminated Sept. 12, 1946, and the dried egg program was sharply reduced. The civilian consumption of eggs was estimated at 367 per capita in 1946, 392 in 1945, 352 in 1944 and an average of 298 in 1935-39.

Poultrymen were warned by the U.S. department of agriculture to reduce egg production in 1947 to take account of the reduced exports and military demand. Most of the exports of eggs were in the dried form which is not popular for domestic use. The improvement in breeding for egg production resulted in the advance from an average of 96 eggs per hen in 1935 to 118 in 1945. Commercial hatching was the chief factor in making this increase possible. In 1946 about 90% of all chickens raised were hatched commercially in contrast to less than 50% in 1930. (See also FOOD RESEARCH; POULTRY.)

FILMS.—Eggs. (Encyclopædia Britannica Films Inc.). (J. C. Ms.)

Egypt. An independent kingdom of northeast Africa; bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, N.E. by Palestine, E. by the Red sea, W. by Libya and the Sahara. Area: 386,000 sq.mi. (arable land 13,600 sq.mi.); pop. (est. June 1944) 17,620,000. Chief towns: Cairo (cap., 1,455,400); Alexandria (756,000); Port Said (132,000); Tanta (105,000); Mansura (79,000); Damanhur (71,000); Asyut (65,000). Language: Arabic; religion: Mohammedan 91%; Coptic 7%. Ruler, King Farouk I; prime ministers: Ismail

Sidky Pasha (Feb. 17-Dec. 8, 1946); Mahmoud Fahmy el-Nokrashy Pasha (Feb. 24, 1945-Feb. 16, 1946, and again from Dec. 9).

History.—Egyptian affairs throughout the year 1946 were conducted against a background of rioting, arson and murder in protest against the continued presence of British troops long after the end of World War II. The attitude of the Arabs over the Palestine question further aggravated unrest.

In mid-Jan. the king of Egypt and Ibn Sa'ud issued a joint statement associating themselves with all Moslem Arabs on the Palestine question and confirming the constitution of the Arab league. Ten days later the ministers of finance, war and supply—all of the "Kotla bloc" (independent Wafdist)—resigned, following the cabinet's refusal to disavow the statement of the foreign minister that the matters outstanding between Egypt and Great Britain were not yet questions for the United Nations. In view of a British reply to the Egyptian note of Dec. 1945 asking for negotiations to be opened for revision of the Anglo-Egyptian treaty of 1899, reaffirmed in 1936, the three ministers withdrew their resignations. Serious rioting headed by students broke out in mid-Feb. and the same three ministers once again resigned as a protest at the way in which the police were handling the students. Mahmoud Fahmy el-Nokrashy Pasha resigned the premiership and the king asked Ismail Sidky Pasha, a former prime minister, to form a government, which he did, taking the portfolios of finance and the interior himself. On Feb. 18 the government received a vote of confidence in the chamber by 105 votes to 3, with 78 abstentions. Violent rioting broke out again and damage was done to churches, shops and hotels. The British minister protested in writing. University students declared a three-day strike in memory of Egyptian "martyrs." Dr. Ahmed Bilal of the Moslem brotherhood was arrested. The Arab league issued a statement pledging the Arab states to stand behind Egypt in the event of a clash with Britain. On March 9 the police closed the offices of the three Wafdist papers in Cairo. The leader and four members of the Young Egypt party were arrested for intimidating shopkeepers. Later in March the British foreign secretary made a statement in parliament that no change would be made in the status of the Sudan in the treaty negotiations until the Sudan had been consulted.

On May 9 formal negotiations with the British delegation led by Lord William Stansgate began. On May 12 British troops began evacuating barracks in Cairo and Alexandria. On June 19 the king received the mufti of Jerusalem, fugitive from the British, who wanted him in connection with anti-Allied activities during World War II, when he was in Berlin. Sidky Pasha stated that no request had been received from the British for the extradition of the mufti and the foreign minister stated that the mufti would be treated as a political refugee and not surrendered.

On July 4 the Cairo citadel was handed over by the British. The British commander in chief, middle east, announced that headquarters of troops in Egypt would leave Cairo for the Canal zone before the end of Sept.; general headquarters, middle east, moved to temporary headquarters at Fayid at the end of the year. In Aug. the Arab league sent a note to the British government requesting British recognition of the former mufti of Jerusalem as the Arabs' leader in Palestine.

On Sept. 27 heads of the British and Egyptian delegations received from the Umma party of the Sudan telegrams stating that the party would not allow negotiations to be concluded without admission being made by both of the full rights of the Sudanese to sovereignty over their country. The following day the prime minister resigned owing to the "breach of faith" of certain members of the treaty delegation in giving the press their views about secret documents. The king asked Sherif

Sabry Pasha to form a coalition cabinet but he was unable to do so and on Oct. 1 Sidky Pasha was asked to remain in office. He consented and issued a declaration pointing out that there was no conflict among members of the treaty delegation regarding the most recent British proposals, which had been unanimously rejected. (G. A. V.)

Sidky Pasha and Abdul Hadi Pasha, the foreign minister, arrived in London on Oct. 17 and during their stay had lengthy conversations with Ernest Bevin, the foreign secretary; they also saw Clement R. Attlee, the prime minister. A joint announcement issued in London on Oct. 25 stated that the conversations were carried on "in the most cordial and friendly atmosphere," and that it was hoped that they would lead to "a decisive result" when the Egyptian ministers returned to Cairo. Returning to Egypt, Sidky Pasha declared on Oct. 26 that he succeeded in his efforts to "achieve unity between Egypt and the Sudan under the Egyptian crown." Two days later Attlee made a statement in the house of commons describing Sidky Pasha's view regarding the Sudan as "partial and misleading." "No change in the existing status and administration of the Sudan is contemplated," he said, "and no impairment of the right of the Sudanese people ultimately to decide their own future." Attlee's statement caused disappointment in Egypt. The two delegations to negotiate a new Anglo-Egyptian treaty met on Nov. 1 and 17, but no decision was reached, mainly because certain members of the Egyptian delegation objected to an admission—that the Sudan had the right to separate itself from Egypt. On Nov. 26 the Egyptian chamber of deputies, after a long debate in secret session, passed a vote of confidence in the government by 159 votes with 3 abstentions, authorizing it at the same time to continue to take steps to "realize the nation's aims"—defined as "evacuation and the unity of the Nile valley"—and to submit the results to parliament. On the same day King Farouk issued a decree dissolving the all-parties delegation to negotiate a new treaty with Great Britain and entrusting the further negotiations with the government. Sidky Pasha, however, faced now such an opposition—mainly on behalf of Wafd and of the Moslem brotherhood—that he resigned again. On Dec. 9 King Farouk appointed a new government with Nokrashy Pasha as prime minister. Press reports described him as faithful to the policy of Saad Zaghlul; i.e., believing in the value of an alliance with Great Britain.

The British admiralty announced on Nov. 27 that the evacuation of Alexandria by the royal navy was completed.

Education.—(1942-43) Elementary and secondary schools 7,415, scholars 1,358,453; colleges 55, scholars 19,581; Fuad I university: scholars, male 8,396; female 713; Farouk I university: scholars, male 2,007; female 64; foreign schools 322, scholars 69,179.

Banking and Finance.—Revenue (est. 1945-46) \$394,661,000; expenditure (est. 1945-46) \$359,178,400; public debt (Oct. 31, 1944) \$380,696,000; notes in circulation (June 1946) \$565,664,000; gold reserve (June 1946) \$52,600,000; foreign assets reserve (June 1946) \$620,700,000; exchange rate (1944-45) 100 piastres = 413.8 cents U.S.;

EGYPTIAN TROOPS marching into the citadel at Cairo, Egypt, after it had been vacated by British forces in 1946

(June 1946) 100 piastres = 413.7 cents U.S.

Trade and Communications.—External trade (merchandise): imports (1944) \$209,399,000; exports \$111,403,000. Provisional monthly averages (1945): exports \$14,345,000, imports \$20,850,000. Communications and transport: (1942) roads, main 1,393 mi.; secondary 4,497 mi.; railways (1943): state 4,037 mi.; agricultural 862 mi.; shipping (1939) 110,000 tons gross; (1944) entered ports 24,197,866 tons gross; (1939) passed through Suez canal 25,827,977 tons gross; motor vehicles licensed (Dec. 31, 1942): cars 28,675; commercial 5,529; cycles 2,321; wireless receiving set licences (Dec. 31, 1942) 98,456; telephone instruments in use (April 30, 1942) 77,099.

Aerial Navigation in Egypt

	1938	1942
	Imperial Airways Ltd.	Royal Dutch Air Lines Misr Airways Company
Passengers	6,056	2,450
Freight and baggage (short tons)	125.6	49.6
Mails (short tons)	1,630	145
Miles flown	6,967,935	2,795,180
Regularity of service	99.9%	98.2%

Agriculture and Minerals.—Production (1943-44) (in short tons): cotton, ginned, 230,318; maize 2,559,000; wheat 1,062,000; rice 897,000; petroleum 1,023,758; barley 249,933; ground-nuts 4,400; beans 355,000. (See also ANGLO-EGYPTIAN SUDAN; ARAB LEAGUE.)

Eire. The southern portion of an island to the west of Great Britain. Under the constitution, operative from Dec. 29, 1937, the name "Irish Free State" was replaced by that of "Eire." Area: 26,601 sq.mi.; pop. (est. 1943): 2,949,713. Capital: Dublin (pop. est. 1945: 502,600); other chief towns (pop. est. 1943): Dun Laoghaire (42,105); Cork (75,484); Limerick (42,070); Waterford (27,825). Languages: Erse (or Gaelic) and English; religion: Christian (Roman Catholic 93%). President: Séan T. O'Kelly (*Ó'Ceallaigh*); prime minister: Éamon de Valera.

History.—Early in 1946 the government embarked on three major public works projects. In January the Electricity Supply board gave a £1,250,000 contract to the Cementation Company, Ltd., Doncaster, for a hydroelectric scheme on the River Erne calculated to take three years to complete and to provide em-

ployment for 1,000 men; a White Paper published on Jan. 14 outlined a ten-year plan to make Eire self-sufficient in fuel by utilizing turf at a cost of about £4,000,000, and in April it was announced that a new graving dock was to be constructed in Dublin at a cost of £750,000 for Eire's enlarged mercantile marine service.

In June stocks of wheat were some 33,000 (short) tons short of the country's estimated needs, but in view of the urgent needs of European countries no imports were sought from the Combined Food board before August. As regards other foodstuffs Eire was, comparatively speaking, a land of plenty and in July and September negotiations took place in London between the British minister of food and an agricultural mission from Eire on the question of increasing food supplies for Britain.

Eire provided more than £3,000,000 for relief of distress in Europe during the year. The question of its status within the British commonwealth was again raised; on June 19 De Valera described Eire as a republic within the commonwealth and said that in his view there was nothing inconsistent in that. After comparative quiescence during World War II the Irish Republican army showed marked signs of activity during the first six months of 1946 and several arrests were made in March. Séan McCaughey, one of the prisoners, went on hunger strike and died on May 11, which gave rise to more protests against the government attitude to prisoners on hunger strike. On May 27 De Valera declared a new war on the I.R.A. and warned hunger strikers that their methods would not procure their release.

During the year Eire sent its first diplomatic representative to Australia and appointed its first chargé d'affaires in Sweden. Eire applied for membership to the United Nations but did not secure the necessary recommendations and so was not elected.

(J. RA.)

Education.—Elementary schools (1943-44): 5,032; scholars 464,738; teachers 12,937. Secondary schools (1943-44): 377; scholars 40,040; teachers 3,386. Universities (1945-46): National, 4,896 students; Trinity college, Dublin, 1,484 students.

Banking and Finance.—Revenue (est. 1945-46) £55,550,000; expenditure (est. 1945-46) £53,490,000; public debt (March 31, 1945) £79,541,000; notes in circulation (June 30, 1946) £40,300,000; gold reserve (June 30, 1946) £2,600,000; securities reserve (April 30, 1944) £25,700,000. £=403.5 U.S. cents.

Trade and Communications.—Foreign trade (merchandise): imports (1945) £40,660,000; exports and re-exports (1945) £35,470,000. Roads, main 9,798; secondary 39,191; railways, total track mileage (1944) 2,493. Shipping (1944): vessels 466; net tonnage 44,650; entered from abroad 3,465 (tonnage with cargo 1,524,316); cleared for abroad 3,463 (tonnage with cargo 1,518,238). Motor vehicles licensed (Aug. 1944): private cars 6,566; motor cycles 4,340; other vehicles 16,420; wireless receiving set licences (1943-44) 173,300; telephone installations (1943-44) 31,168.

Agriculture, Manufacturing, Mineral Production.—Production (1945) in U.S. bushels: wheat 21,394,000; rye 283,000; barley 6,995,000; oats 50,803,000. In short tons: potatoes 3,343,000; beet sugar 824,000; flax 6,000; coal (1941) 170,000. Livestock (1945): horses 445,000; cattle 3,856,000; sheep 1,922,000; pigs 390,500; poultry 11,874,000. Agriculture and fisheries: total output (1943-44) £96,821,000. Number of insured works (average, 1944) 406,000; number of unemployed (average, 1945) 60,700.

Eisenhower, Dwight D. (1890—), U.S. army officer, was born Oct. 14 at Denison, Tex. He was admitted to West Point, graduating in 1915, and during World War I was an instructor at several U.S. army

camps. After graduating from the Army War college he served in the office of the chief of staff, Washington. In 1935 he served in the Philippines as Gen. MacArthur's chief of staff. In June 1942 he was given command of the U.S. headquarters in England and was promoted to the rank of lieutenant general. Eisenhower commanded Allied armies that conquered North Africa and Sicily (1943), invaded Italy (1943), landed in France (1944) and in conjunction with soviet forces conquered Germany in 1945. Eisenhower, who had been raised to the rank of a general of the army on Dec. 15, 1944, was designated chief U.S. representative in the Allied military government for the rule of Germany (March 29, 1945). He moved his headquarters to Frankfurt-on-Main on May 26. On Nov. 20, 1945, he was named chief of staff of the U.S. army, succeeding Gen. George C. Marshall.

The growing number of G.I. demonstrations against delays in demobilization prompted Eisenhower to ban the protests in early Jan. 1946 and he stated Jan. 15 that too rapid a speed-up in demobilizations would cause the U.S. to "run out of army." In the spring and summer of 1946 the general frequently appealed for an extension of the draft and strengthening of the armed forces. On March 28 President Harry S. Truman named Eisenhower for promotion to permanent five-star rank.

Generally, Eisenhower backed U.S. foreign policy. On May 28 he urged military collaboration with Latin-American nations and possibly Canada and on Oct. 16, during a tour of Europe, he visited Gorizia where he stated that U.S. troops would remain in troubled areas of the world until democratic governments could be established. In early Jan. 1947 Eisenhower scotched rumours that he would be a candidate for the presidency in 1948 with a flat denial.

Elections. In early elections in 1946, the G.O.P. showed premonitory strength. It reclaimed the 23rd Pennsylvania congressional district, which had voted Democratic from 1932. It held the 1st Oregon district after a hard fight. Its successes in these contests, as well as an increase in its vote in local disputes, seemed to reflect the Democratic weakness which manifested itself in the forthcoming congressional and state elections in November.

Herbert E. Brownell, Jr., then Republican national chairman, derived special satisfaction because, as he noted, the Democratic candidates in these early, off-year tests had campaigned on a platform of "Support Truman!" With other contests staged in 1945, the results in these engagements meant that the Democrats had lost every debatable congressional trial after Harry S. Truman succeeded F. D. Roosevelt on April 12, 1945.

Spring senatorial primaries indicated that the American people, even in the west, favoured full participation in world affairs. Several noninterventionists and opponents of Roosevelt's foreign program, which Truman adopted with minor modifications, were defeated in Democratic and Republican contests.

The fatalities included such senate veterans as Burton K. Wheeler of Montana, Henrik Shipstead of Minnesota, Robert M. La Follette, Jr., of Wisconsin and Gerald P. Nye of North Dakota.

The Democrats entered the important November struggle under numerous handicaps. President Truman's popularity and prestige had fallen so low that he took no part in the national campaign, except to vote at his home town of Independence, Mo. He was dubbed "the forgotten man of 1948" by friends and enemies.

He suffered personal political humiliation when he headed a movement to "purge" Representative Roger C. Slaughter of the 7th Missouri district because of his opposition to the Truman legislative program. Although Slaughter was defeated in the

Democratic primary, the man who won over him was beaten badly in the general election.

Truman's difficulties derived partially from his inability to persuade or force an overwhelmingly Democratic congress to enact laws of a social, political, racial and economic nature. He was assailed as "weak and ineffective" because of his legislative reverses.

The racial, liberal and labour groups which would have benefited from enactment of these defeated or shelved measures were disappointed, and did not conceal their chagrin. The confusion over food controls, which were held responsible for an unprecedented shortage of meat on the eve of election, alienated consumers, small business men and retailers.

A wave of strikes in key industries that halted the reconversion program, caused a scarcity of all consumer and durable goods and inflated prices, helped to complete the process of breaking up the catch-all political organization which Roosevelt had built.

An effective anti-administration issue was its alleged "appeasement" of an aggressive and belligerent Moscow, as well as the popular belief that certain key officials pursued this policy for domestic political purposes. Indeed, albeit reluctantly, Truman was forced to ask for the resignation of Henry A. Wallace, then secretary of commerce, because of his open advocacy of an even softer attitude toward the soviet. But even this disavowal and discharge of a vocally pro-soviet cabinet member did not resuscitate party fortunes.

The Wallace episode, moreover, alienated so-called "liberal" groups, who viewed his dismissal as evidence that President Truman had abandoned the Roosevelt foreign policy. Many admirers of the former chief executive, including his son, Elliott, levelled this indictment against the administration's handling of domestic as well as foreign questions.

On the other hand, numerous racial blocs whose European homelands and kin had suffered from Moscow's postwar expansion—the Poles, Jews, Germans, Czechs etc.—were antagonized because they did not feel that either Roosevelt or Truman had been sufficiently firm toward the soviet.

Democratic national chairman Robert E. Hannegan tried to revive old New Deal spirit by distributing recordings of Roosevelt's more stirring speeches for use at rallies and headquarters throughout the country. But these canned discussions of war and prewar issues seemed to make no impression on an electorate struggling with new, postwar problems of a bread-and-butter kind. There was no indication that this strategy saved an old vote or won a new one. Instead, especially as ridiculed by the Republicans, it sharpened the impression that President Truman was an unimportant and ineffective figure.

In view of these Democratic dissensions and difficulties, the Republicans presented no positive program. They relied on a purely protest vote for victory, stressing the "three C's" listed by their national chairman, Carroll Reece, as the winning issues—"confusion, controls and communism."

On Nov. 5, 1946, the G.O.P. won by a landslide, regaining full control of congress for the first time since 1930, when the Democrats carried the house. The Republicans increased their senate membership from 39 to 51, leaving the Democrats with 45 seats.

It was considered significant that the opposition won in both industrial and agricultural regions. Most important, perhaps, was their showing in the metropolitan centres which Roosevelt had always carried by tremendous majorities. They won or broke fairly even in such erstwhile Democratic strongholds as Boston, New York, Philadelphia, Pittsburgh, Chicago, Cleveland, St. Louis, San Francisco and Los Angeles.

By reason of these municipal victories, the G.O.P. recaptured

senate seats in such key states as Massachusetts, New York, Pennsylvania, Delaware, Ohio, Missouri, Wisconsin, Minnesota, Montana, Utah and Washington. They lost the senatorial races by extremely close margins—from 2,000 to 5,000—in Maryland, West Virginia, Wyoming and New Mexico.

The G.O.P. boosted its house strength from 192 to 246, with the Democrats holding 188 seats and the American Labor Party retaining one place. The Republicans also increased their total of governors to 25, meaning that they controlled the state establishments in 25 of the 32 commonwealths outside the solid south and the border states. In the congressional elections, their popular plurality over the total Democratic vote was slightly more than 3,000,000.

A notable feature of the election was the casualties suffered by the radical labour candidates, especially those endorsed by Wallace. Only two of the C.I.O.'s more prominent legislative champions survived—Rep. Helen Gahagan Douglas of California, a Democrat, and Vito Marcantonio of New York, the sole American Labor Party victor.

So sweeping was the Republican comeback that Senator J. William Fulbright, Arkansas Democrat and Rhodes scholar, thinking apparently of England's ministerial system of responsibility, proposed that President Truman hand over the executive branch of the government to the Republicans. He suggested that Truman name a Republican as secretary of state and then resign, thus permitting the G.O.P. cabinet member to succeed him. The idea was not taken seriously in any quarter.

James A. Farley, former Democratic national chairman, whose absence on a world business trip during the campaign brought charges that he had "run out on the party," emerged from his long silence soon after election. Roosevelt's erstwhile Warwick said that, despite the Nov. 5 defeat, the Democratic party could win in 1948 if it would install new leadership and administrative heads "from the top down."

The Democratic upset badly damaged the political machines in most of the great cities. Whereas Roosevelt carried New York by 716,000 in 1944, James M. Mead won it by only 189,000 in his race against Governor Thomas E. Dewey. Henry Cabot Lodge, running for the United States senate, eked out a majority in Boston.

Frank Hague, mayor of Jersey City and political boss of the state, lost the governorship for the third straight time, the U.S. senate fight, and saw a decline of Democratic membership in the state legislature and the house of representatives. The seemingly impregnable Cook county organization in Chicago was routed for the first time in 14 years, losing many key county offices. Only a few weeks after election, Mayor Edward J. Kelly, who had headed the party in Chicago for years, announced that he would not seek re-election.

It was the same story in Philadelphia, Pittsburgh, St. Louis, Kansas City, Los Angeles, San Francisco and in many smaller places. In fact, the only important city which returned a Democratic administration was "Ed" Crump's bailiwick of Memphis in the border state of Tennessee.

In addition to the fact that they were victims of a general "against the ins" uprising, there appeared to be several new and basic factors behind the rout of the bosses. It was not accomplished by excitable, hysterical and hurriedly organized bands of reformers and purists who, so often in the past, retired from the field after a lone victory.

The city organizations were hoisted by hard, practical, political fighting. In many places the opposition benefited from installation of voting machines that afforded an honest count. They also had control of election officials and the courts, two agencies which helped to prevent manipulation of the ballots. Campaigns to strike the names of "floaters" and "dead men"

NEGROES waiting in line to vote in Georgia primary, July 17, 1946; this was the first time that they were permitted to vote in a primary election in that state

from registration rolls had been conducted in numerous cities. The possession of this machinery gave aroused citizens an opportunity to voice effective protest against boss rule.

The Republicans' 1946 triumph stirred factional and individual rivalries, largely because of their belief that they would recapture the White House in 1948. As the year closed, the following Republicans were willing and eager, despite protestations to the contrary, to run against Truman in 1948:

Gov. Thomas E. Dewey of New York, Senator Edward F. Martin of Pennsylvania, Senators Robert A. Taft and John W. Bricker of Ohio, Sen. Arthur H. Vandenberg of Michigan, ex-Gov. Harold E. Stassen of Minnesota and Gov. Earl Warren of California.

Schedule of Elections.—Presidential elections in the United States are uniformly held on the Tuesday after the first Monday in November in years designated by multiples of four. Congressional elections are held on the same or corresponding day in even years by all states except Maine, which adheres to its old custom of holding elections on the second Monday in September. Governors are elected in even years on the same day as members of congress in 22 states: Arizona, Arkansas, Colorado, Connecticut, Georgia, Idaho, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Mexico, North Dakota, Ohio, Rhode Island; South Dakota, Tennessee, Texas, Vermont and Wisconsin. They are elected quadrennially at the same time as the president in 10 states: Delaware, Florida, Illinois, Indiana, Missouri, Montana, North Carolina, Utah, Washington and West Virginia; quadrennially at the congressional elections between presidential years in 10 states: Alabama, California, Maryland, Nevada, New York, Oklahoma, Oregon, Pennsylvania, South Carolina and Wyoming;

quadrennially on the corresponding day in the years immediately preceding presidential elections in 2 states: Kentucky and Mississippi; quadrennially on the corresponding day in the years immediately following presidential elections in 1 state: Virginia; triennially on the corresponding day in 1 state: New Jersey. Louisiana chooses its governor quadrennially in presidential years on the third Thursday in April; and Maine, biennially at the same time as it selects its congressmen. (See also DEMOCRATIC PARTY; REPUBLICAN PARTY; UNITED STATES and under various state articles. For elections in other countries see under the name of the country.) (R. Tu.)

British Commonwealth and Europe.—During 1946 elections and referenda were held in Australia, Belgium, Bulgaria, Czechoslovakia, France, Greece, Italy, the Netherlands, New Zealand, Poland, Rumania and Turkey.

Australia.—Voting took place on Sept. 28. The Federal Labour party obtained 43 seats, followed by the United Australia (Liberal) party with 17 and the United Country (Conservative) party with 12. The main issues were represented by the Labour party standing for opposition to further large tax reductions against the Liberal and Conservative parties who were in favour of the reductions. The opposition wanted strikes and lock-outs to be made illegal and penalties enforced. A referendum held at the same time as the elections sought to amend the constitution to give the commonwealth government power to legislate (1) on social benefits, (2) organized marketing, (3) conditions of employment in industry. In each case the voters gave a mandate in favour of the constitution being amended to achieve the proposed legislation.

Belgium.—Elections were held on Feb. 17. There were domestic differences between Socialists and Communists on wage and price control. The Catholic (including the Christian-Social) party opposed nationalization. In the background there was Catholic support for a referendum on the return of King Leopold III. The Catholic party gained 92 seats, the Socialist 69, the Liberals 17 and the Communists 23, the last a relatively large increase.

Bulgaria.—Elections were held on Oct. 27. The Communist-sponsored Fatherland Front parties won a majority totalling 364; of these 277 seats went to the Communists, 69 to the dissident Agrarians, 9 to the dissident Social-Democrats and 8 to the *Zveno* Union (Army party). The opposition (Agrarian-Democratic and Independent Socialist parties) won 101 seats. The opposition leaders declared that they took part in the election only to show that they were not afraid to enter the contest, and that there were sufficient irregularities to reduce the pro-Fatherland Front vote from 66% to 22%.

Czechoslovakia.—The Czech and Slovak peoples voted on May 26. In Bohemia-Moravia the Communists won 93 seats, the Social-Democrats 37, National-Socialists (Dr. Benes's party) 55 and the Populists (Catholics) 46. In Slovakia the Communists won 21 seats, the Labour party 2, Christian-Democrats 43 and the Freedom party 3. This was a test of strength between eastern and western concepts of democracy. All parties were agreed on nationalization measures, expulsion of minorities, and the need to continue the coalition. The Populists and the National-Socialists favoured slower nationalization and more limited expulsion of Sudeten German skilled workers.

France.—During 1946 two referenda and three elections were held. On May 5 the draft constitution prepared by the first constituent assembly was rejected by 10,488,059 "no" against 9,327,073 "yes." The Catholic M.R.P. (*Mouvement Républicain Populaire*), the right wing and the Radical parties were against it, favouring a stronger upper chamber and wider powers for the president of the republic; Socialists and Communists supported the draft.

On June 2 a second constituent assembly was elected. The M.R.P. gained and rose from 142 (out of a total of 592) seats, which they had obtained on Oct. 21, 1945, to 163; the Socialists declined from 142 to 128; the Communists slightly decreased from 152 to 150; the Radicals (appearing with affiliated groups, as R.D.G. or *Rassemblement des Gauches*) rose from 25 to 47 and the right wing obtained 67 seats instead of 70.

The new draft constitution prepared by the second constituent assembly was adopted in a referendum held on Oct. 13 by 9,120,576 votes against 7,980,333; there were 7,938,884 abstentions (General Charles de Gaulle called upon the electorate to abstain from voting).

On Nov. 10, the constitution having been adopted, elections to the new national assembly were held. The Communists showed a new relative gain and secured 182 seats (out of 619), the Socialists declined again to 101, and the M.R.P. secured 172; the R.D.G. increased to 69; two right wing groups gained 66 but there were 16 members mainly rightist but "nonaffiliated" to any group; finally there were 13 Algerian Moslems (of whom five were Nationalists).

On Nov. 24 preliminary indirect elections were held for the creation of the new upper chamber, the council of the republic, which with the national assembly joins in electing the president of the republic. On that day some 84,600 *grands électeurs* were elected. On Dec. 8 the *grands électeurs* in each *département*, together with local *conseillers-généraux* and the deputies in the assembly for that *département*, voted for 200 metropolitan members of the council of the republic, the 14 members for Algeria being also elected the same day. The distribution of seats was as follows: Communists 61, Socialists 37, R.D.G. 25, M.R.P. 62, right wing groups 20, Left Independents 2, Algerian Moslems 7. The remaining 101 seats were distributed later, and to these the national assembly elected 42 members on Dec. 20.

Greece.—Elections were held on March 31. The Populists (Monarchists) won 206 seats, the National Political Union (a coalition of three small republican parties led by Sophocles Veniselos, George Papandreu and Panavotis Kanellopoulos) 68, Themistocles Sophoulis Liberals 48, the supporters of Colonel Napoleon Zervas 17 and the Independents 11. The issues were mainly royalist v. republican and Right v. Left. The

elections were followed on Sept. 1 by a referendum on the return of the king. Out of the 1,861,146 persons who registered 1,691,592 (90.9%) voted and 1,170,470 (69.3% of those who voted) were in favour of the king's return. There were 346,862 blank voting papers and of the 176,224 republican votes 3,813 were cancelled. The blank papers and the republican votes were against the king's return and totalled 523,086. The vote represented a demonstration of Greek solidarity in foreign affairs rather than purely royalist vote.

Italy.—The first elections after the end of the fascist regime were held on June 2. The Christian-Democrats won 207 seats, followed by the Socialists with 115 and the Communists with 104. There was a large number of smaller parties which sprang up, the largest being the National-Democratic (Liberal) Union which gained 41 seats, *Uomo Qualunque* which won 30 and National Freedom (Monarchist) Bloc 16. The issues were monarchy v. republic and clerical v. anticlerical policy. The extent of future public control and land reform were important issues. A referendum on the monarchy was held at the same time; 12,717,923 votes were cast in favour of a republic and 10,719,284 for the monarchy; as many as 1,798,136 papers were invalid.

Netherlands.—Elections were held on May 17. The Roman-Catholic party won 32 seats, the Anti-Revolutionary (Conservative) party 13, the Christian-Historical (Protestant) Union 8, the State Reform (Calvinist) party 2, the Freedom (Liberal) party 6, the Social-Democrats 29 and the Communists 10. The confessional and anticonfessional parties were broadly aligned against each other. The Catholic party supported social reform, but were anti-Socialist. The Anti-Revolutionary party attacked the government's Indonesian policy.

New Zealand.—Elections were held on Nov. 27. The Labour party obtained 43 seats, the National (Conservative Farmers') party 37 seats. The issues were domestic rather than foreign. Both parties were agreed on controls, but the National party favoured reduction of taxation, modification of the means test for pensions and giving producers a greater measure of control while retaining bulk marketing and guaranteed prices for the export producer. Labour was charged with yielding too readily to trade union pressure.

Poland.—A referendum took place on June 30. The Polish electorate had to answer the three questions: (1) Are you for the abolition of the senate? (2) Are you for making permanent the economic system instituted by land reform and nationalization of basic industries? (3) Are you for the Oder-Neisse frontier? The Polish Peasant party, the only party allowed to fight openly for true democracy, decided to vote "no" to the first question in order to count all the electors opposed to a regime controlled by the Communist party. According to Stanislaw Mikolajczyk, leader of the Peasant party, 83.5% of the electorate voted "no" to the first question. The regime, however, published after a delay of 12 days completely different results, according to which the answers to the first question were 7,844,522 "yes" and 3,686,029 (32%) "no."

Rumania.—The Rumanian people went to the polls on Nov. 19 to elect a single chamber parliament. The Communist-sponsored Democratic Front won 348 seats; the National-Peasant (chief opposition) party obtained 32, the National-Liberal (Conservative) party 3, the Popular Hungarian Union 29 and the Democratic-Peasant party 2. According to the official figures (contested by the opposition) the government parties obtained 84% of the votes.

Turkey.—The Turkish people went to the polls on July 21. The elections were based for the first time on universal suffrage and were the first reasonably democratic elections to be held, though the Democratic (opposition) party complained of violence and terrorism being used against them. The Republican People's (Government) party won 395 seats, the Democratic party 62 and the Independents 8. All parties agreed on their attitude to the U.S.S.R., but there was disagreement on internal policy. (J. G. Fo.)

Electrical Industries. Plainly in the record of the electrical industry appear the effects of the disturbed industrial conditions of 1946. Strikes, shortages, controls persisting from the World War II period and all the difficulties afflicting the converting economy of the United States, did not prevent the year from being one of tremendous industrial production and the highest of history in peacetime national income. But this great accomplishment was spotty and uneven, some lines of production being extremely low, others very high. An example taken from the statistics of the electrical industry shows this condition in sharp outline.

Planning for 1946 construction in the fall of 1945, electric utility engineers programmed an expenditure of nearly \$360,000,000 for distribution systems. The money actually laid out was slightly more than that.

In bleak comparison to this picture stands that of production plant construction. Of more than \$313,000,000 estimated for the building of new plants in 1946, less than \$220,000,000 was actually expended. In both cases higher costs had their effects in equal ratios. But in the one case it was possible to obtain materials and equipment for construction in fairly sufficient quantity, while in the other these essentials were obtainable only in severely reduced volume. This contrast illustrates clearly the confused industrial conditions of the year.

Above: 40-FT. LIGHTNING ARRESTER, an experimental model said to be the largest ever built, being constructed at Trafford, Pa., in 1946 for use in a 500,000 volt test transmission line

Above: 90,000 KILOWATT hydro-electric generator under construction during 1946 at the General Electric company's plant in Schenectady, N.Y. It was one of three ordered for the rebuilding of the Dnieprostroi dam in Russia

Below: VIEW in the Westinghouse Electric corporation plant at East Pittsburgh, Pa., during 1946, showing two circular motor frames for 900 h.p. electric motor. The "bull's-eye" in the centre is a commutator for a 12,000 kva. rotary converter

Below: ARMATURE OF A huge turbogenerator under construction at Pittsburgh, Pa., during 1946. The worker is winding insulating tape around the end connections

Output of electricity for public supply in 1946 was slightly above that of 1945, 223,300,000,000 kw.hr. as against 222,500,000,000. These total figures do not give a true picture. In the second half of 1946 weekly output figures climbed up rapidly, consistently setting records above those of corresponding weeks in 1943-44, the peak years of war production. This upsurge of energy output was the sharpest in the industry's history and was evidence of brisk recovery from the industrial paralysis caused by the widespread strikes in the first half of the year.

Although output in 1946 was slightly above 1945, sales of electricity were a little below, 191,000,000,000 kw.hr. and 193,500,000,000 kw.hr. respectively. The apparent inconsistency is explained by larger system losses in 1946 caused by a combination of many factors—more customers, decrease in large, and increase in small volume sales, etc.

From 1945, sales of energy to large industrial customers declined about 7%, from 107,000,000,000 kw.hr. to 100,000,000,000 kw.hr. This drop was mostly cancelled by increases in sales to commercial, residential and rural customers of 2,500,000,000, 4,200,000,000 and 800,000,000 kw.hr. respectively.

Revenue from energy sales was \$3,450,000,000 in 1946, up about 3% from 1945. Here is another apparent inconsistency, increased revenue with decreased sales. The explanation is that decline in revenue from large industrial customers was more than offset by rise in revenue from others.

A striking phenomenon of the war years persisted through 1945-46. This was the rapid increase in use of electricity for domestic purposes. During the war the manufacture of electric appliances was stopped, yet despite this the average annual consumption of electricity continued to climb and had reached the figure of 1,229 kw.hr. in 1945. In 1946 the largest increase on record was made, the average rising to 1,327 kw.hr. For this energy the average residential customer paid \$42.93 and the average rate reached a new low of 3.23 cents per kw.hr.

More customers were added to electric utility lines in 1946 than in any previous year of the industry's history, the figure of total customers rising from 34,000,000 to 36,100,000. Of the increase, residential and rural customers accounted for 1,750,000 and of this number 600,000 were estimated to be rural. The combined figure of home users of electricity, urban and rural, was 31,000,000.

The ability of electricity supply systems to serve their customers was seriously affected by the disturbed industrial conditions of 1946 which, as earlier stated, prevented the installation of generating capacity on the scale that had been planned. In 1946 the net increase in capacity was very small, only a fraction of 1% rise from the 50,111,000 kw. of 1945 to the 50,196,000 of 1946. In the second half of the year peak loads rose to heights above the record of the war period and this, with output running above previous levels, left dangerously small margin of reserve capacity. Reserve, which is generally accepted as safe at around 20% was whittled down nearly to one-half of that in 1946.

Hopeful to widen the margin of reserve, supply system engineers planned for the installation of about 10,400,000 kw. of new capacity in the next two or three years, more than 3,000,000 being programmed to go into operation in 1947.

Division of ownership of generating capacity remained unchanged in the year, 20% government and 80% private enterprise. The ratio of fuel to hydro power also remained the same, 70% and 30% respectively.

The increases in loads and outputs against the small net increase in capacity resulted in a rise of unit output in 1946, 4,453 kw.hr. per kw. in comparison with 4,433 in 1945. Principally because of postwar declines in light metals production, mostly supplied with electricity from hydro plants, fuel power

production increased from 4,021 kw.hr. per kw. in 1945 to 4,121 in 1946. This heavier loading of fuel power capacity shows itself in a new low figure of thermal economy, 1.29 lb. of coal per kw.hr. as the national average.

Rising far above the highest previous year—\$919,000,000 in 1930—electric utility construction expenditures estimated for 1947 reached a total of more than \$1,300,000,000. Federal expenditures for power purposes increased the estimate another \$100,000,000, approximately. Estimates of 1946 construction, made late in 1945, came to about \$900,000,000. Only about two-thirds of this amount was actually expended. Thus the 1947 construction budget included a considerable carry-over from 1946. Also included was a significant increase in construction costs amounting to an average of 30% across the board, according to replies to a survey conducted by *Electrical World*.

Maintenance expenses of electricity supply systems in 1946 amounted to more than \$232,000,000. Indicative of how costs for keeping systems in good operating condition were going up were the estimated figures for maintenance expense per kw. of capacity—\$4.47 in 1945, \$4.63 in 1946 and \$5.10 in 1947.

More than 55,000 mi. of rural lines were built by electric utilities in 1946 at an expenditure of some \$89,000,000. This is exclusive of Rural Electrification Administration (REA) operations which included about 50,000 mi. at an expenditure of about \$130,000,000. These figures may not be used to arrive at comparative costs per mile of line because in both cases expenditures for other than line building are included. It was estimated that more than 500,000 farms were connected to service lines during the year, bringing the total number of electrified farms, as defined by the U.S. bureau of the census to more than 3,400,000. This is about 63% of all occupied farms.

All of the increased revenue of electric utilities in 1946 was absorbed by increased pay to employees. Pay rolls constituted the largest item in utility expense. In 1945 the estimated 222,000 utility employees received an average wage of \$50.49 per wk. In 1946 the number of employees increased to 246,000 and the average weekly wage to \$52.59 and working hours had declined from 42 to 41.5 hr. per week. Compared with labour in manufacturing industries, power company employees in Dec. 1946 received 130.5 cents per hour as against 114.2.

As in other industries, strikes caused much trouble for the electric utilities in 1946. The worst was in Pittsburgh, Pa., where striking employees of the Duquesne Light company remained out for 17 days. Despite this, however, service to the city was maintained at a reduced level by the efforts of supervisory employees of the company. Result of the Pittsburgh strike and of others was a widespread public demand for compulsory arbitration or some other device for composing labour disputes in the utility industry.

Financing operations of electric utilities in 1946 amounted to slightly more than \$1,000,000,000, about one-third under 1945. New money coming into the industry was nearly four times as much as in 1945, but the actual sum, \$173,000,000, was still disconcertingly small in relation to total capitalization and to the cost of necessary future expansion. Refunding financing, totalling around \$900,000,000, was down about one-third from 1945, which was the highest year of record.

Plagued by shortages and beset by strikes, electrical manufacturers had a hard time in 1946. In the face of these difficulties, their showing for the year was remarkable. Four out of the six production indexes of electrical manufacturing showed rises over 1945. The two that showed declines were for goods in which were included production definitely for war purposes. The production index for refrigerators jumped from 170 in 1945 to 1,363 and for other appliances from 62 to 246. Rises in production indexes of transmission and distribution equipment and of insulated wire and cable were less spectacular, from 138 to 144 in the first case and from 100 to 115 in the second.

Up to the war period, the index of over-all production in electrical manufacturing marched along in fairly close coincidence with the Federal Reserve board index of national production. Then the index curve

of electrical manufacturing shot far above that of the FRB ratio. In 1944 electrical manufacturing stood at 430 while national production was 231. In 1945 the positions were 390 and 223. Both declined in 1946, to 276 and 179. The gap between the two indexes was narrowing, but with the demand for electrical goods remaining consistently strong, as all indications were that it would, it was not likely that return of the indexes to their prewar condition of practical coincidence would come very soon.

Of technical advance in 1946 the electrical industry had little to report beyond progress in directions already started. Development was begun toward the production of electricity from atomic energy in pilot or experimental plants at Oak Ridge, Tenn., and Schenectady, N.Y. But up to the close of the year the only published results from explorations in this field were predictions that atomic power would be available for commercial uses in 5, 10 or 20 years, depending on the optimism of the particular prophet.

The year saw further experimentation and development in the gas turbine, but no outstanding installations. Of considerably more practical moment was the advance recorded in the successful application of steam temperatures of 1,000° F. and above in plants of the Atlantic City Electric company and the Public Service Electric and Gas company. In general terms it may be said that 1946 saw the beginning of the process of digestion and assimilation by which inventions and advances previously made become integral parts of the body economic. (See also PUBLIC UTILITIES; TENNESSEE VALLEY AUTHORITY.)

Great Britain.—At the beginning of 1946 generating plant supplying the national grid totalled 12,297,000 kw.; this was some 15% below requirements because of the deferment in setting up new installations during the war. Extensive overhauls and repairs were needed; plants had been out of service for long periods and, in order to avoid serious overloading of the grid system, load shedding was necessary. Return to normal conditions would probably take three or four years. The central electricity board's program of plant extensions for completion before 1949 comprised 4,619,000 kw., including 18 new generating stations. Several 60,000 kw. alternator sets were being installed, steam pressures of 1,250 lb. per sq.in. and temperatures of 950° F. being used, with hydrogen cooling for the main alternator. During the first 11 months of 1946 authorized undertakers generated 36,868,000,000 kw.hr. compared with 33,608,000,000 kw.hr. in the corresponding period of 1945.

New construction of overhead lines was limited by the acute shortage of materials, particularly of poles. A specification for a simple and cheap British standard overhead line for voltages up to 11 kv. was published, and 240 volts were decided upon as the standard for low-voltage A.C. distribution. Unification of electricity tariffs was widely discussed; if the supply industry were nationalized this would probably in large measure be achieved. In spite of rising costs there was little, if any, increase in tariffs.

Industrial Developments and Research.—With the removal of blackout restrictions discharge lighting was installed on a large scale; it was becoming the most popular form of street lighting, although the systems used lacked uniformity. Fluorescent tubular lighting was widely adopted, particularly in offices and public buildings. High frequency heating, which produces temperature rises of several hundred degrees Centigrade in a few seconds, was increasingly used and there was further development of air blast and resistance-switched oil circuit breakers. Progress was made in the development of plastics for insulation in electrical construction. Research was done on silicones and particularly on silicone varnishes and oils which were of interest because of their exceptional heat stability.

Electrical domestic appliances, including thermostatically-controlled irons, reappeared on the home market: some 350,000 fires and 460,000 irons were made available during the first six months of the year. Although welcomed by the housewife, this return was partly responsible for the embarrassing increase in the power demand on the generating system.

There was great interest in the heat pump: the first large heat pump in Great Britain was designed, constructed and installed by the Norwich electricity department to warm 500,000 cu.ft. of building space. The heat delivered was nearly three times the B.T.U. (British thermal unit) equivalent of the electrical energy consumed by the pump.

The larger electrical manufacturing firms and the universities investigated the possibilities of the use of atomic energy for peaceful purposes. Substantial monetary grants were made to the universities by the department of scientific and industrial research for nuclear research and a 200,000,000 volt betatron was being built.

Exports.—Exports of electrical goods and apparatus during the first ten months of the year amounted in value to £42,140,767, of which £29,941,723 was mainly for cables, insulation, telephone apparatus and domestic appliances and the remainder for boiler-house plant and electrical machinery. Power transformers for operation at 231,000 and 242,000 volts were constructed for export by British manufacturers.

Commonwealth.—As in Great Britain, the increased demand for power called for new power station construction and government-sponsored transmission and distribution schemes. In New Zealand large extensions to hydroelectric generating stations and the construction of new ones were under way. The Rural Electrical Reticulation council was set up to co-ordinate rural development and to administer a government subsidy scheme. An electricity commission was established in Western Australia to control generation and transmission in the state; the Queensland electricity commission prepared a £2,700,000 program for the erection of new power stations. In Tasmania, where 75% of the water power of Australia is located, a new hydroelectric station was to be constructed on the River Derwent.

The government of Bombay planned to set up an electricity board to rationalize generation and transmission in rural areas and to construct new power stations with an interconnecting grid network. A scheme for the electrification of 2,200 sq.mi. in rural Bengal was to be put into operation.

To provide for increased railway electrification in South Africa large

extensions to power stations were to be undertaken.

Europe.—During the period 1946-50 11,700,000 kw. of new generating plant were to be installed in Russia, raising the total capacity to 22,400,000 kw. and the estimated annual output to 82,000,000,000 kw.hr. A special soviet ministry was formed for the electrical engineering industry.

In Sweden, where the electricity generated averaged nearly 2,000 kw.hr. per annum per inhabitant, some 5,400 km. out of a total of 16,700 km. of railway line were electrified by the end of 1946. Four 200 kv. transmission lines were in operation and an experimental 90 kv. D.C. line was under construction.

Water power, highly developed by the nazis, produced 55.7% of the electrical energy generated in Austria in 1945, but after the defeat much reconstruction was needed. The British zone in Germany had a generating capacity of some 2,000,000 kw.; the energy generated in 1946 was approximately 4,600,000,000 kw.hr., some of which was exported to France and the Netherlands. German wartime experimental work on 400 kv. transmission lines came to light during the year.

France nationalized its electricity supply industry. In both Rumania and Greece large-scale hydroelectric schemes were drawn up and a great Danubian dam was to be constructed for the provision of two-thirds of Rumania's electric power requirements.

Hydroelectric production in Italy was 50% of the normal at the beginning of the year. In Switzerland the power stations were overloaded and new constructions were under consideration. The estimated energy generation in Czechoslovakia for 1946 was 6,200,000,000 kw.hr.; in Poland the 345,000,000 kw.hr. generated in Jan. 1946 was to be increased to 530,000,000 kw.hr. before the end of the year.

Eire planned the extension of both water power and peat-burning stations to provide for a £25,000,000 rural electrification scheme on which work had begun.

(E. W. G.)

Electric Transmission and Distribution: see ELECTRICAL INDUSTRIES.

Electric Transportation. The total number of passengers carried by urban electric transportation lines in the United States in 1946 remained close to the high levels of 1944 and 1945. This development was in part because of the exceptionally high level of industrial employment, which is always an important factor affecting the volume of riding on all types of urban transportation lines, and in part because of the rather limited number of private automobiles which came on the market to compete with public transportation service. Another factor which should be noted, though its influence can not be exactly measured, was the growing popularity of electric transportation in comparison with motor bus transportation. Indications were that this was a result of notable improvements in the design of electric vehicles. Popularity of the electric trolley coach was especially evident, this type of service having been selected in a number of public opinion polls in different cities as the best liked of all forms of public transportation service.

A comprehensive survey made during the year 1946 by the American Transit association of the operating results of 1,253 transit companies covering all important cities in the United States showed that 52% of the total number of passengers were carried by electric railway lines and 5% by trolley coach lines, or an aggregate of 57% for electric transportation as compared with 43% for motor bus transportation. This distribution of riding remained virtually unchanged during the year 1946. There was a slight decrease in the number of passengers carried by the surface electric railways because of substitutions of trolley coach operation or motor bus operation on some lines

Ten-Year Record of Passengers Carried by Electric Transportation in the United States 1937-46

	Surface Railways*	Rapid Transit	Trolley Coaches	Total†
1937	7,161,000,000	2,307,000,000	289,000,000	9,757,000,000
1938	6,545,000,000	2,236,000,000	389,000,000	9,170,000,000
1939	6,171,000,000	2,368,000,000	445,000,000	8,984,000,000
1940	5,943,000,000	2,382,000,000	534,000,000	8,859,000,000
1941	6,081,000,000	2,421,000,000	652,000,000	9,154,000,000
1942	7,290,000,000	2,566,000,000	899,000,000	10,755,000,000
1943	9,150,000,000	2,656,000,000	1,175,000,000	12,981,000,000
1944	9,516,000,000	2,621,000,000	1,234,000,000	13,371,000,000
1945	9,426,000,000	2,698,000,000	1,244,000,000	13,368,000,000
1946	9,096,000,000	2,860,000,000	1,281,000,000	13,237,000,000

Data from American Transit Association. 1946 figures based on preliminary reports.

*Figures include riding in both urban and suburban areas, but the suburban riding represents only a very minor part of the total.

†Statistics of passengers carried by electrified suburban and trunk-line railroads not available for presentation in this form.

in place of rail operation. Riding on trolley coach lines increased substantially both as a result of the numerous extensions of this type of service and also the augmented patronage of lines already in operation. The number of passengers carried by rapid transit lines showed no significant change from the previous year.

Modernization of Rolling Stock.—New rolling stock, which the electric transportation lines had been unable to secure in large quantity during World War II, made its appearance in many cities during 1946. Indications were that the beginning of 1947 would see about 3,000 of the modern "Presidents' Conference Committee" (P.C.C.) type of street cars in operation in cities in the United States and Canada, with about 1,400 additional cars of the same type on order. Considerable interest was shown after the end of the war in the possibilities for the use of the P.C.C. car in other countries. Licence agreements were signed with car builders in England and Belgium for the production of P.C.C. cars for operation in numerous countries in Europe and elsewhere throughout the world. One demonstration car was ordered by the tramways of Mexico City.

The year 1946 was marked also by an unprecedented volume of trolley coach purchases. Manufacturers of this type reported that the number of vehicles ordered between the end of the war and the latter part of 1946 was greater than the entire production of the industry in the 15 years before the war. A moderate number of the new trolley coaches were provided with complete air conditioning. This was the first use of air conditioning in local transportation other than as an experiment. Additional trolley coaches were designed for later addition of air-conditioning equipment if desired.

Since there were no indications of any slackening of demand, the manufacturers of electric trolley coaches were planning to increase their production facilities for 1947. Activity in trolley-coach buying was attributed to three main factors—the ability of this type of vehicle to increase earnings for operators, its excellent record of safety, comfort and speed and its amazing popularity with the riding public.

Outstanding in the field of rapid-transit rolling stock was the placing of an order for 400 new subway cars for the city of New York. These cars marked a definite step forward in subway-car design. They embodied a number of P.C.C. car features as well as fluorescent lighting. The rapid-transit system of the city of Cleveland also ordered new cars. These were essentially of P.C.C. type with modifications to meet special conditions.

Wages and Fares.—Following V-J day the transit industry in the United States experienced a wave of wage increases ranging from five to ten or more cents per hour. This was followed during 1946 by a second wave which, added to the first, brought the total increase up to about the 18½-cent level established in a number of important instances in manufacturing industries to compensate for loss of take-home pay because of shortened working hours. In the local transportation industry there had been little shortening of working hours as there had been no decrease in demands for service. However, transit wages tended to follow the general industrial wage pattern.

A difficult economic situation was thus created for the transportation industry where the ratio of wages to gross revenue is far higher than in manufacturing industries. Many increases in fares were granted to offset the increases in operating costs. As a result, the average cash fare rose from 7.72 cents at the beginning of the year to 7.82 cents in the latter part.

Heavy Electric Traction.—Conditions in the field of heavy electric traction were relatively static during 1946. No important extensions were made to existing systems in the United

States or Canada. Some extensions were made in South America and new electric locomotives were acquired by the Paulista, Sorocabana and Central Brazil railroads. (J. A. Mr.)

Great Britain.—Work on London suburban schemes, planned before World War II, was resumed during 1946 and manufacturers in Great Britain supplied locomotives and multiple-unit stock to existing systems in South Africa, New Zealand (Wellington suburban lines) and India. The Southern railway in England approved plans for the electrification of an additional 284 route-mi. to Ramsgate, Dover and Hastings, estimated to save 330,000 tons (U.S.) of coal annually.

South Africa.—Postwar development in South Africa involved the conversion of 266 mi. of line of which the main work was the electrification of the Bellville-Touws river section (149 mi.). In addition, the whole of the Cape peninsula suburban system was to be reorganized and existing lines and equipment were to be converted from 1,500 to 3,000 volts D.C. All electric railways in the union would then be standardized.

India.—In India the Mysore state planned the electrification of the Bangalore-Mysore section to cut coal imports and reduce maintenance.

Europe.—Steady progress and ambitious plans in railway electrification were made during 1946, and the European continental systems which had suffered badly during World War II were largely restored. The production of plant and equipment for existing lines and extensions increased steadily. In the many schemes planned acute fuel shortage was the main reason for the renewed attention to electrification.

In Italy restoration work and the extension of electrification over former steam routes was carried on. Electric working was restored in March on the badly damaged 196-mi. Milan-Bologna-Florence main line and the completion of electrification on the 77-mi. line between Domodossola and Milan was planned. In the Netherlands electric services were restored over 115 mi. of the 349 previously operated. In February the electrification of the longest privately owned railway in Sweden, the 353-mi. line between Goeteborg and Gaevle, was completed. This was expected to save about 90,000 tons (U.S.) of coal per annum. The Swedish Railway board planned the electrification of a further 776 mi. of state line in the next 5 years. Progress continued in Switzerland, where considerable attention had been given to design, especially to the development of high-speed power bogies and light-weight stock. A locomotive put in service in 1946 on the Loetschberg railway of the double bogie type weighed 88 tons (U.S.) and developed 4,000 h.p. The spring-disk flexible drive of this locomotive was of great interest; the prevalence of flexible drives in Switzerland was in marked contrast to the plain axle-hung motor in extensive use elsewhere.

Many projects were planned and started. The program to convert 1,250 mi. of railway within 12 yr. was resumed in Austria. This represented 50% of the Austrian system, conveying 75% of all state traffic. In France the national railways proceeded with the conversion of 1,287 route-mi., bringing the total electrified route to 3,481 mi. This scheme, to be completed in 1955, was estimated to save 2,450,000 tons (U.S.) of coal per annum. The first section of the former Paris-Lyons-Méditerranée main line from Paris to Chasse (near Lyons), 322 mi., was in hand. Other important conversions planned were Chasse-Marseille (204 mi.), Lyons-Geneva (106 mi.) and the whole of the Paris suburban system. The soviet five-year plan adopted in March 1946 envisaged the electrification of 3,300 route-mi., largely to conserve fuel, to increase line capacity and in some cases to overcome the difficulties of scarce or bad water. One of the most ambitious of projected works was that of the now nationalized broad gauge Spanish railway system. A 12-yr. plan was launched for the electrification of 2,500 mi., estimated to save 1,220,000

tons (U.S.) of coal annually. This was the first stage of the 8,000-mi. system to be completely electrified. (F. A. H.)

Electrification, Rural: see RURAL ELECTRIFICATION.

Electronics. As the world in 1946 shifted gradually from war toward a peacetime status, many wartime technical developments became available for civil use. This was true, for example, of radar and several manufacturers brought out simplified versions for use in merchant ships. Also made available for commercial use was loran. Where radar merely shows direction and distance of above-water features around the vessel, loran permits the navigator to fix the position of his craft with as much precision as from sights on celestial objects. It was installed and used on the S.S. "Drottningholm," in the Atlantic service, and other ships, including the S.S. "America," which was reconditioned for commercial service after being used as a transport during World War II.

Also announced during 1946 was "shoran," an aid to blind bombing during the war. Capable of precision equal to that of first order survey work, with an error of a foot in five miles, it has great peacetime possibilities in mapping uncharted parts of the earth. The aeroplane transmits two signals which are received at two ground stations, of which the positions are accurately known. Unlike radar, which merely sends back a reflection with no addition of energy, the shoran ground stations immediately and automatically retransmit a signal back to the plane. The air-borne equipment determines the time taken for each round-trip path, and so indicates the distance from each of the ground stations.

Combining radar and television as an aid to air navigation is "teleran," developed by the Radio Corporation of America, which gives the aviator instantly and accurately his position and other needed data. This eliminates the need of bulky and complicated radar equipment aloft. A large and accurate search radar on the ground sends out a signal. On the teleran equipped plane there is a transponder which, as with shoran, automatically transmits back to the ground station. This permits operation over a greater distance than if the radar receiver receives only the unreinforced echo reflected from the plane. Also the response is on a different frequency from the transmitted radar pulse. This avoids confusion from echoes reflected by stationary objects.

The indication of the ground radar is presented in a viewing tube which shows the position of the plane in its correct direction and distance. Over this is placed a transparent chart of the region, with essential features marked. This combination is viewed by a television camera and its image is radioed back to the plane. It is displayed on a picture tube in front of the pilot, so he can immediately see his position. The same television system can be used to transmit other data, such as a weather map.

Another navigation development was the ground position indicator, referred to as G.P.I., which indicates continuously the present position on the earth's surface of the plane or other vehicle in which it is carried. The position may be given on dials either as the present latitude and longitude, or as the total distance from a particular fixed point. From compass data the device records the direction travelled by the plane, while an airspeed indicator shows how much it moves in the surrounding atmosphere. To correct for winds, a radar set is used to pick up the reflection from some landmark, which is shown on the face of the radar tube. The aviator then sets an index to the bright spot which represents it. After a short time it has drifted away from the index, which is then reset. This automatically introduces into the computing mechanism the proper correction for the movement of the air, and the device then continues to give

the ground position, until the wind changes. Then the wind correction is reset.

One of the most striking accomplishments of radar during 1946 was the success of the U.S. army signal corps' project "Diana," receiving signals sent from the earth and reflected from the moon. Such echoes were first detected at the Evans Signal laboratory on Jan. 10, in the form of audible signals. A special transmitter giving a pulse of 0.2 to 0.5 seconds duration, at a frequency of 111.5 megacycles was employed. The signals were radiated from a directional antenna on a 100-ft. tower, which faced the moon as it rose or set. The echo, which returned after an interval of between 2.38 and 2.72 sec., corresponding to the moon's distance of 221,000 to 253,000 mi., was detected with a receiver of extreme sensitivity. This was necessary because the power received from the moon was only 11×10^{-16} (0.0000000000000011) watts, compared with 4,000 watts radiated into space!

Though these results were qualitative rather than quantitative, they demonstrated the possibility of observing celestial bodies by means other than the light they reflect or radiate. With further refinements, and much narrower beams, observations of surface features of the moon and perhaps even of the nearer planets may be possible. Later in the year radar proved of value in observing the Giacobinid-Zinner shower of meteors on Oct. 10, which was the finest observed in the United States in many years. Cloudy weather was general over the eastern part of the country, interfering with visual observations, but the meteors were detected and counted at several stations by radar.

While radar will not penetrate under water, another electronic device, called "sonar" (for sound navigation and ranging), proved highly successful during the war, and was, according to the navy, responsible for detecting and locating a majority of the 996 enemy submarines sunk. It was developed for the navy by the Bell Telephone laboratories, with the help of other commercial organizations. Like radar, sonar operates on an echo principle. However, it is not radio waves which are sent out and reflected, but sound waves. Electronic analysis of the echo received from an underwater object gives the desired information about its location and distance.

For echo ranging, sonar equipment is installed in a submarine or surface vessel below water level. The same apparatus sends out the sound waves and also receives the echo. The position of the projector when the echo is detected indicates the direction of the target, while the time required for the echo to return shows distance. In some cases, the sonar system is gyro-controlled so that the beam remains fixed in the same direction regardless of the turns made by the vessel on which it is installed.

The magnetic effect of a submarine served as the basis of its detection with the airborne magnetometer, familiarly known as the "aerial doodle-bug." It was devised in a co-operative effort by the Naval Ordnance laboratory and the Bell Telephone laboratories. Resembling an aerial bomb, it is lowered by a cable from an aeroplane and flown over the region to be examined. Iron and steel in the underwater boat produce a concentration of the lines of force of the earth's magnetic field: This affects the sensitive needle in the magnetometer and so reveals the U-boat's presence.

Since the device works equally well over land, and is affected by many kinds of ore deposits underground, the "doodlebug" was expected to be of value in aerial prospecting for possible oil and mineral producing areas. In fact, in addition to using it for detecting submarines, the navy employed it in an aerial search over some 40,000 square miles in the United States and Alaska for geological structures which might contain oil. After such a preliminary survey, the promising areas would be investigated

more thoroughly by ground parties.

A use of radar during World War II revealed in 1946 was that of a high-speed glide bomb developed for the navy, and known as the Bat. About 12 ft. long, with a 10-ft. wing spread, it was provided with a charge of half a ton of high explosive and a radar set which guided it to the target even though the latter was moving. Suspended under the "mother" plane, in which were the operators, the Bat's radar was set to a target, picked up either with the eye or by the mother plane's radar. When the Bat was released, it glided straight to the target.

The Gorgon was a jet-propelled flying bomb with a television camera in its nose and a transmitter which sent back what it saw to the mother plane. There the bombardier guided it as if he were riding along on the bomb in a suicide attack. It had a speed of as much as 550 m.p.h. and could carry more than a ton of explosive.

Another guided missile that found wartime use was Azon. Actually a tail assembly containing a radio receiver and associated controls, it was attached to standard 1,000 or 2,000 lb. standard bombs, and was used under conditions when the target was visible from the plane. Azon could be guided in azimuth, *i.e.*, to right or left; Razon, a similar device could, in addition, be guided in range as well, as it was made to glide at a steeper or lower angle.

Seeing in the dark was possible with several different types of war-developed apparatus, on which information was released in 1946. Some were highly sensitive detectors of heat or infra-red rays, which could pick up the radiation from a man's body in the dark a quarter of a mile away, or that from ships and the chimneys of factories. More elaborate were the sniperscope and snooperscope, which flooded a scene with infra-red rays and by means of an "infra-red telescope," developed at the RCA laboratories, showed a visible image.

A lens forms the infra-red image on a specially treated glass surface which, in proportion to the intensity of the radiation falling on it, gives off electrons. These in turn are focused by an electron lens to form an image on a fluorescent screen which glows where electrons strike and makes the image visible. It is viewed by a magnifying eyepiece. The sniperscope was used to aim a rifle in the dark. The snooperscope consisted of the same units—the infra-red floodlight and the viewing tube, together with the associated power pack carried by the user—but held by a separate handle for reconnaissance. In still another form it was attached to a soldier's helmet and could be used, for example, in driving a jeep in total darkness, the vehicle being provided with infra-red headlights. This had a maximum range of about 700 yd.

While Braille printing and "talking books" on records have done much to make literature available to the blind, there still remains a vast amount of printed material beyond their reach. To make it possible for a blind person to read any printed matter, an electronic device for reading by sounds was announced by the Radio Corporation of America as having been developed in experimental form, in co-operation with the Committee on Sensory Devices of the National Academy of Sciences.

The user moves a hand-held stylus along the line of type. At the bottom there is a vertical slit through which a beam of light scans the print vertically, 30 times per second. When the beam strikes a dark spot at the top of its swing, a high pitched note is heard through head phones. A spot at the lower end produces a low note, while if it encounters blackness all the way, a tonal variation from the highest to the lowest is heard. Suppose the "reader" comes to the capital letter N. As the slit passes the first upright part, the combination of high and low tones is heard. Then it traverses the upper part of the diagonal and a high-pitched note is heard, which slides down the scale

as the stylus is moved. At the second vertical leg the combined tone is heard again. This combination of sounds is characteristic of N and the user learns to recognize it. Reading speeds better than 10 words a minute have been attained, and it was believed that these could ultimately be raised to about 60 per minute.

While new electronic tubes, such as the klystron, were developed to operate at extremely high frequencies, producing waves of the order of a few inches in length, such tubes cannot be used for high amplification except with a very narrow range of frequencies. Some of the most promising uses of these microwaves, however, such as television, require amplification over a very wide frequency range. This can be done with a new "travelling-wave" tube devised by the Bell Telephone laboratories.

A stream of electrons from a heated filament is aimed down the long tube in a narrow beam. For nearly a foot of the length, the electrons pass through a closely wound helix of wire which carries the signal current. This progresses as a wave down the helix, and the electrons travel along its axis a little faster. The complicated interaction between the electrons and the travelling wave in the helix produces amplification. It can be roughly compared with the building up of waves in water by the wind. The electrons form a sort of "electric wind" which blows past the wave as it travels and so strengthens it.

A new electronic device that was likely to be important in future studies of the atomic nucleus had its debut in 1946. This is the synchrotron, invented independently by V. Veksler, a Russian physicist, and E. M. McMillan, of the University of California. A small synchrotron, modified from a betatron, another type of atom smasher, was placed in use in England. The first to be designed as such, as far as known, was a 70,000,000-volt machine which began operation in October at the General Electric Research laboratory in Schenectady, N.Y. A 300,000,000-volt synchrotron was under construction at the University of California's Radiation laboratory.

Electrons are accelerated in a doughnut-shaped vacuum tube, located between the poles of a large electromagnet. They are injected from a heated filament. The magnet operates on alternating current and as the cycle progresses the magnetic field builds up and the electrons are whirled around faster and faster within the tube, gaining energy on each revolution. When they have attained energies of a few million volts, they are moving at constant speed, which is practically that of light, beyond which they can not be accelerated. This operation is identical with that of the betatron.

However, at this stage another means of acceleration takes over. One segment of the tube is a metal cavity, a double-walled tube with a slit inside. This is connected with an oscillator like that of a radio transmitter so that electrons surge back and forth within it. The interaction of these with the electrons encircling the tube is such as to give them a push each time they pass. When they reach maximum energy the oscillator is turned off and the orbits of the electrons contract. Then they hit a tungsten target they previously missed, and so generate a stream of high-energy X-rays which can be used in nuclear research.

The synchrotron overcomes one limitation of the simple betatron, which has been built to give radiation of 100,000,000 volts energy. That is that as the electrons move with higher and higher energies they radiate away much of their energy in electromagnetic waves. The mechanism is similar to radiation of radio waves from an antenna where electrons also are moving back and forth. This loss is finally so great that the electrons can not be given additional energy.

With the synchrotron, however, any loss of energy of the electrons causes them to move in a smaller orbit and they return

Above: **ELECTRONIC READING AID** for the blind, under development in 1946 by Dr. V. K. Zworykin and L. E. Flory of RCA laboratories, Princeton, N.J. The hand-held stylus, containing a scanning light beam, is moved across a line of printed type thereby converting letters and words, into recognizable sounds

Right: **"AERIAL DOODLEBUG,"** electronic device which was effectively used by U.S. navy planes during World War II in finding and tracking enemy submarines. It was revealed by the navy on June 1, 1946, and was expected to find peacetime application in aerial prospecting for oil and mineral deposits

Lower right: **SYNCHROTRON**, a new atom smasher placed in operation in the General Electric Research laboratory at Schenectady, N.Y., Oct. 24, 1946. This machine, built under a contract with the office of naval research, U.S. navy, delivers a beam of 70,000,000 volt X-rays

Below: **RADAR ANTENNAE** used by U.S. army signal corps technicians in making radar contact with the moon on the night of Jan. 10, 1946, at Belmar, N.J.

to the gap sooner than normally. This causes them to get more than their ordinary quota of energy, and so they are compensated for the loss. On the other hand if they get too much the orbit is enlarged, they return to the cavity late and receive a smaller increase of energy. Also, compared with the betatron, the synchrotron is smaller for the same energy. For example, the 100,000,000-volt betatron has a magnet weighing about 135 tons, while that for the 70,000,000-volt synchrotron weighs only 8 tons. (See also ATOMIC ENERGY; CHEMISTRY; PHYSICS.)

Employment. **United States.**—The civilian labour force (people available for gainful employment) numbered 60,000,000 in Aug. 1946; 5,650,000 more than in Aug. 1945, the increase being a result of the return of servicemen and -women minus the number of women and older men who withdrew from the labour market. Of these the unemployed numbered approximately 2,040,000 (3.4%) in Aug. 1946 compared with 830,000 in Aug. 1945.

Males in employment in Aug. 1946 numbered 42,830,000 and females 17,170,000. Females constituted 29.4% of the gainfully employed persons in Aug. 1946, a decline from 35% in 1945. This decline resulted from an increase of 7,810,000 in the number of males in the labour supply and a decline of 2,160,000 in the number of females in the labour market.

Employees in nonagricultural establishments numbered 39,881,000 in Aug. 1946, 661,000 more than in May 1946 and 779,000 more than in July 1945. From Aug. 1945 to Aug. 1946 there was a decline of 433,000 in the number of people working in manufacturing establishments and a decline of 543,000 in federal employees, but an increase of 43,000 in construction workers; 45,000 in mining; 140,000 in trade; 494,000 in financial institutions and 14,000 in transportation and public utilities.

Examination of the employment figures and indexes in Table II reveals the respective growth and recession trends in the various types of industries during the earlier reconversion period which followed V-J day. Some of the heavy industries, such as steel and electrical machinery, were characterized by declining employment, while many consumers' goods industries, such as furniture, pottery, textiles and paper products, were expanding their employment rapidly.

Table I.—Number of Employees in Nonagricultural Establishments, by Industry Division, United States*

Industry Division	Number of employees (estimated) in thousands			
	Aug. 1946	July 1946	June 1946	Aug. 1945
Total estimated employment†	39,881	39,265	39,056	38,172
Manufacturing‡	14,586	14,244	14,098	15,019
Mining	829	815	807	784
Contract construction and federal force-account construction	2,109	1,976	1,874	927
Transportation and public utilities	4,000	3,962	3,917	3,860
Trade	7,803	7,747	7,749	6,979
Finance, service and miscellaneous	5,160	5,152	5,131	4,666
Federal, state and local government excluding federal force-accounting construction	5,394	5,369	5,480	5,937

*Distribution of labour force by sex, see *Monthly Labor Review*, Oct. 1946, p. 618.

†Estimates include all full- and part-time wage and salary workers in nonagricultural establishments who worked or received pay during the pay period ending nearest the 15th of the month. Proprietors, self-employed persons, domestic servants and personnel of the armed forces are excluded.

‡Estimates for manufacturing have been adjusted to levels indicated by final 1944 data made available by the bureau of employment security of the Federal Security agency. These estimates, which are comparable with the production worker estimates in Table II, supersede those shown in mimeographed releases dated prior to July 18, 1946, and in issues of the *Monthly Labor Review* dated prior to Aug. 1946. Data from Jan. 1943 forward were affected by this revision. A complete series from 1939 to date is available upon request.

Table II.—Number of Production Workers and Indexes of Production-Worker Employment in Manufacturing Industries, by Major Industry Group, United States*

Industry group	Number of production workers Estimated in thousands		Production-worker indexes, (1939=100)	
	Aug. 1946	Aug. 1945	Aug. 1946	Aug. 1945
All manufacturing	11,581	12,179	145.0	148.7
Durable goods	5,997	6,779	166.1	187.7
Nondurable goods	5,884	5,400	128.4	117.9
Iron and steel and their products	1,433	1,490	144.5	150.3
Electrical machinery	520	640	200.7	246.8
Machinery, except electrical	1,051	1,076	199.0	203.7
Transportation equipment, except automobiles	453	1,468	285.4	925.2
Automobiles	731	556	181.8	138.3
Nonferrous metals and products	392	378	171.0	165.1
Lumber and timber basic products	625	524	148.7	124.7
Furniture and finished lumber products	388	330	118.1	100.5
Stone, clay, glass products	404	317	137.8	108.1
Textile-mill products and other fibre	1,197	1,049	104.7	91.7
Apparel and other finished textiles	1,049	897	132.9	113.6
Leather and leather products	354	313	102.9	90.2
Food	1,166	1,102	136.5	129.0
Tobacco manufactures	86	79	91.7	84.3
Paper and allied products	366	311	137.8	117.0
Printing, publishing and allied industries	385	322	117.3	98.3
Chemicals and allied products	475	600	164.9	208.3
Products of petroleum and coal	152	135	143.4	128.0
Rubber products	227	191	187.5	158.0
Miscellaneous industries	427	401	174.4	163.9

*The estimates and indexes presented in this table have been adjusted to levels indicated by the final 1944 data made available by the bureau of employment security of the Federal Security agency.

In durable goods the shrinkage of the index of employment was from 195.3 in July 1945 to 161.0 in July 1946; in non-durable goods there was a rise from 118.0 to 124.9 (1939 = 100). The number and indexes of manufacturing employment in July 1946 and July 1945 are shown in Table II.

Table III.—Indexes of Employment and Pay Rolls in Selected Nonmanufacturing Industries, United States, July, June, May 1946 and July 1945
(1939 average=100)

Industry group and industry	Employment indexes				Pay roll indexes			
	July 1946	June 1946	May 1946	July 1945	July 1946	June 1946	May 1946	July 1945
Mining:								
Anthracite	82.2	79.8	81.0	77.6	155.7	187.1	180.4	142.7

Hotels (year-round)	111.1	104.4	107.7	92.2	180.1	177.2	173.5	138.7
Power laundries	119.0	119.9	119.9	109.4	204.5	205.0	204.6	171.2
Cleaning and dyeing	113.7	112.3	110.7	108.3	193.3	190.9	186.2	169.7
Class I steam railroads	130.1	131.6	129.6	121.2	231.4	236.6	227.0	197.7
Water transportation	136.6	131.6	132.3	146.9
	228.2	229.0	250.6	310.0	490.1	467.4	486.3	755.5

Employment on construction work, including both private contract construction and federal force-account construction, remained almost stationary from July 1945 to July 1946, gaining insignificantly.

Table III gives indexes of employment and pay rolls of selected nonmanufacturing industries in May, June and July 1946 and July 1945.

Great Britain.—The total working population of Great Britain increased from 19,750,000 in mid-1939 to 21,337,000 in Sept. 1945 and decreased to 20,402,000 by Sept. 1946, as indicated in Table IV.

Table IV.—Total Working Population, Males and Females, Great Britain: Sept. 1946 and Sept. 1945

	Sept. 1946	Sept. 1945
Total working population excluding indoor, private domestic service		
Males	14,596,000	14,831,000
Females	5,806,000	6,506,000
Total	20,402,000	21,337,000
Ex-members, His Majesty's forces, unemployed	490,000	260,000
Insured persons registered as unemployed	359,000	173,000
In His Majesty's forces, national fire service, police and industry		
Males	13,853,000	14,531,000
Females	5,700,000	6,373,000
Total	19,553,000	20,904,000

Table V.—Supply, Distribution by Industries of Labour, Great Britain: Sept. 1946

Number employed in industry	
Manufacturing of equipment and supplies for armed forces	530,000
Manufacturing for home market	
Metal and chemical industries	2,452,000
Other manufacturing	2,453,000
Manufacturing for export	1,410,000
Basic industries and services	5,531,000
Building and civil engineering	1,240,000
Distributive trades	2,254,000
Other services	1,938,000
Total	17,808,000
Civil defense, National fire service and police	88,000
Armed forces and auxiliary services	1,567,000
Ex-members, His Majesty's forces, unemployed	490,000
Insured persons registered as unemployed	359,000
Total working population (exclusive of indoor, private domestic service)	20,402,000

Canada.—The general employment index (1929 = 100) averaged 146.3 for 1945 and 140.8 for the first quarter of 1946.

South Africa, Union of.—The South Africa general employment index (1929 = 100) averaged 160.5 for 1945 and reached 172.0 in Jan. 1946.

Australia.—The employment index (1930 = 100) averaged 136.5 for the first eight months of 1945. Later figures were not available.

South America.—Argentina's statistics (1929 = 100) averaged 132.5 in 1945 and remained at that level during the first two months of 1946. Very little change occurred in the index of Argentine employment throughout 1942-45. The index for Chile (1929 = 100) was 128.3 during the last quarter of 1945. Employment had remained at approximately that level after 1941.

Sweden.—The Swedish index of industrial employment, contrary to those of other countries, showed lower employment in the first half of 1945 than obtained in 1935-44. It then rose sharply to approximately 120 through the first quarter of 1946 (1929 = 100).

Switzerland.—The Swiss index (1929 = 100) reached 92.7 in March 1946, the highest level of employment in Switzerland after 1930.

None of the other countries published employment statistics in 1945-46. (D. D. L.)

Enderbury Island: see PACIFIC ISLANDS, U.S.

Endocrinology. The multiple activities of the adrenal cortex received a great deal of attention during 1946. It had been known for some time previous that the large

number of physiologically active steroids which had been isolated from the adrenal cortex could be divided into three functional groups: (1) those which primarily affect sodium and potassium balance (*e.g.*, desoxycorticosterone), (2) those which predominantly influence the metabolism of foodstuffs (the so-called C_{11} steroids) and (3) those steroids which, in structure and function, resemble the active hormones of the testis and of the ovary.

Despite this knowledge it was difficult to make any quantitative assessment of derangements of adrenal cortical function in man because the methods for determining the titre of the various steroids in blood and urine were laborious biological procedures of doubtful accuracy.

During 1946 four methods were proposed for the determination of the C_{11} group of steroids. Three of the methods were purely chemical procedures which, although not too specific or accurate, give consistent results.

The fourth is a biological method which depends upon the ability of the C_{11} adrenal steroids to aid in the deposition of liver glycogen in test animals. While none of these methods could be said to yield really exact figures regarding the level of a specific steroid in the blood or urine, they at least gave consistent comparative results. They might, therefore, make possible the further exploration of variations in adrenal function induced by physiological and pathological states, and thus aid in the study of the dynamics of cortical function.

It had been well established that the adrenal cortex normally contains a large amount of ascorbic acid (vitamin C). Its function in the gland was a matter of speculation. None of the many hypotheses proposed had received any experimental proof. It had been shown that when the adrenocorticotrophic hormone of the pituitary (A.C.T.H.) was given to intact animals, chemical changes occurred in the cells of the adrenal cortex. The high cholesterol and ascorbic acid contents of the gland decreased sharply in the first hours of A.C.T.H. action. Since cholesterol was probably the "mother substance" of the steroid hormones, its decrease was thought to be a result of the stimulation of the cortex to secrete and manufacture steroids. It now appeared that a similar consideration might apply to the ascorbic acid changes. B. E. Lowenstein *et al.* reported the isolation of an active steroid from the adrenal which contains ascorbic acid as the principal side chain.

It had been realized that the relation between hormones and vitamins must be an intimate one, since they both act either as essential parts of cellular catalytic systems or as modulators of such catalytic activity. However, the precise nature of such relationships was far from clear. The work of E. P. Ralli and of others during 1946 shed some light on this problem. It was, of course, well known that, given an adequate diet, adrenalectomized rats could be kept alive by the administration of sodium chloride alone. The above workers demonstrated that when the diet was deficient in pantothenic acid (one of the B vitamins), sodium chloride therapy was of no avail. Even the administration of potent cortical hormones did not maintain life for long in the deficient adrenalectomized animals. Sodium chloride and the steroids again showed their usual activity when pantothenic acid was restored to the diet.

These results indicated that salt and/or the cortical steroids probably act upon one or more catalytic systems in which pantothenic acid is active.

As noted, among the steroids manufactured by the adrenal cortex are some possessing "sex activity." Usually, when the activity of these steroids was manifested, their effects resembled those of the male sex hormones. Thus, certain adrenal cortical tumours caused the well-known syndrome of masculinization in women. Feminization of men as a result of an adrenal corti-

cal tumour was extremely rare. However, during 1946 J. Schiller demonstrated that the administration of A.C.T.H. would lead to vaginal cornification in ovariectomized rats, indicating the activity of oestrogenic steroids originating in the adrenal cortex. In order to get consistent results he had to remove portions of liver from his animals, since the small amounts of oestrogen secreted were inactivated by a normal amount of liver tissue. These experiments also suggested that the production of sex steroids by the adrenal cortex need not be a manifestation of glandular derangement, since in this work the oestrogenic effect was produced in response to a normal stimulus of adrenal cortical activity.

Spleen.—From time to time it had been claimed without satisfactory substantiation that the spleen was capable of certain endocrine functions. However, the work of G. Ungar must be given more serious attention. It was known that during the "alarm reaction," when the adrenal cortex was stimulated to great activity, there was an increase in the clotting propensities of the blood as evidenced by a diminution in bleeding time. Ungar demonstrated that the administration of the corticotrophic hormone of the pituitary, or of adrenal cortical extracts, evoked a similar reaction in normal animals but not in animals from which the spleen had been removed. He also showed that a substance prepared from spleen would decrease the bleeding time in all types of animals, even in those deprived of the hypophysis, adrenals or spleen. If these results were substantiated, it would establish the spleen as an organ of internal secretion, participating in the chain of endocrine responses initiated by the pituitary.

Ovary.—It had been known for some years that the follicle-stimulating hormone (F.S.H.) of the hypophysis led to growth of the Graafian follicle of the ovary, and that the addition of luteinizing hormone (L.H.) matured the follicle and led to the escape of the ovum from it (ovulation). In 1946 F. L. Hisaw succeeded in reproducing the phenomenon of ovulation in the test tube. When a piece of a frog ovary was suspended in a suitable solution in a test tube, and the correct proportions of F.S.H. and L.H. were added to the solution, ova ruptured out of the follicles and fell to the bottom of the test tube. Besides demonstrating the direct action of gonadotrophic hormones on the ovary, this work seemed to offer a promising method for the further study of the intimate nature of the ovulatory process.

Further knowledge was gained concerning the nervous control of gonadal function. It was known that in certain species (e.g., rabbit) ovulation occurred following stimulation of the cervix of the uterus. It was thought that the stimulus proceeded to the central nervous system and was then transferred to the anterior lobe of the pituitary, leading to the release of luteinizing hormone which acted upon the ovary. But since there are at most few nerve fibres leading from the hypothalamus to the anterior pituitary, it was difficult to trace the ovulation reaction in its entirety. Following previous work which indicated a humoral link between the hypothalamus and the anterior pituitary gland, J. E. Markee showed that well-controlled electrical stimulation of hypothalamic areas caused ovulation in rabbits. Similar direct stimulation of the pituitary did not elicit ovulation. He concluded that under physiological conditions the nervous stimulus arrived in the hypothalamus, and that some substance was secreted there which humorally affected the pituitary. The significance of this work was wider than the problem of ovulation, since it lent support to the concept that the hypothalamus was an area of the brain, the function of which was intermediate between that of nerve tissue and that of an endocrine organ.

The oestrogens, as well as the other steroids, are highly insoluble in water. The problem of their transport in blood had never been elucidated. In 1946 C. M. Szego and S. Roberts presented evidence that the oestrogens were bound to one of the serum protein fractions. This might be the means by which they were made soluble and transportable in the aqueous medium of the blood.

Thyroid.—After 1943 a series of antithyroid drugs were used clinically in an effort to treat hyperthyroidism without resorting to surgery. One of the major objections and obstacles to success was the toxic reaction to drugs such as thiouracil, exhibited by 10% of the patients treated. These reactions ranged from mild fevers to fatal depressions of the normal production of the white blood cells. A simple chemical modification might remove this toxic danger, as would appear from the work of E. B. Astwood. He treated 150 patients with propyl-thiouracil without any toxic reactions. (See also *PHYSIOLOGY*; *ZOOLOGY*.)

England: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

English Literature. The first year of peace brought no immediate relief to publishing houses hampered by paper rationing; this was, in part, the reason few outstanding books appeared in 1946. A deeper cause was the fact that younger writers had mature experience of little but war and were anxious to report their experiences. Personal records of the war appeared one after the other, covering practically every rank in every service. Most of these books were little more than journalism but, among a long list ranging from the war correspondent's summing up such as d'Arcy Dawson's *European Victory* to the more intimate adventure books like W. Jones's *Twelve Months with Tito's Partisans*, a few works stand out. There was an underlying assertion of faith in humanity in John Coast's *Railhead of Death*, modesty and clarity in Martin Lindsay's *So Few Got Through* and, finally, fine writing and an understanding of the jungle which made the second of Bernard Fergusson's accounts of the Chindits, *The Wild Green Earth*, a work of serious literature. War books of a different kind were Alan Moorehead's biography of Field Marshal Montgomery, Lord Wavell's *Allenby: Soldier and Statesman* and one more work of a leading military writer, General J. F. C. Fuller's *Armament and History*. Among books on the political aspects of the war and its causes were Lord Templewood's *Ambassador on Special Mission*, an intriguing account of his work in Madrid, and Professor E. M. Carr's *The Twenty Years' Crisis, 1919-1939*, a work of more enduring scholarship. The peril in which liberal humanist thought is placed by the revolutionary results of total war was made clear in the serious warning of *Victors, Beware*, by Salvador de Madariaga, and Victor Gollancz's broadsheet, *Our Threatened Values*.

Under this catafalque of war books, works of creation and imagination were somewhat subdued. In a lean year for the novel, both Somerset Maugham and J. B. Priestley, among older writers, produced works that received praise: *Then and Now*, and *Bright Day*. Gerald Bullett published *Judgment in Suspense* and Arthur Koestler *Thieves in the Night*, which proved more of a tract than a novel. Christopher Isherwood sustained but did not increase his reputation with *Prater Violet* and Henry Green's *Back* disappointed. Mary Lavin won notice with *The House in Clewe Street* and Walter Allen with *Rogue Elephant*. The reverse of subdued was the painter Mervyn Peake's *Titus Groan*, as startling in its magnitude as in its bid to out-revive the Gothic revival with a work of castellations and gargoyles. Among several translations, Cyril Connolly's version of Albert Camus's *The Outsider* introduced the existentialist novel to Britain.

Short stories, an increasingly popular art form, were numerous and of high quality. They included Elizabeth Bowen's *The Demon Lover*, N. Heseltine's *Tales of the Squirearchy*, Rosamund Lehmann's *The Gipsy's Baby* and the slick *Better Than a Kick in the Pants* and *Nine Men of Soho*, by J. Maclaren Ross. V. S. Pritchett added to his reputation as a leading English master of the medium with *It May Never Happen and Other Stories*. Short stories rather than poetry distinguished the increasing number of little reviews. *New Writing and Daylight*, *Penguin New Writing* and *Transition* were joined by *The Windmill*, *Orion* and other collections of mixed importance. A more serious review, *Polemic*, was also launched.

Poetry published included Edwin Muir's *The Voyage and Other Poems*, a work of merit, Dorothy Wellesley's *Desert Wells*, Gavin Bone's *Beowulf in Modern Verse*, Robert Graves's *Poems 1938-45*, a work of studied craftsmanship, Henry Reed's *Map of Verona*, Geoffrey Grigson's *The Isles of Scilly* and V. Sackville-West's slender *The Garden*. Most interesting of all was the appearance of *Deaths and Entrances*, by Dylan Thomas, poems remarkable for their intensity and compact structure.

Among biographies and memoirs, many were grateful for a *Shorter Ego*, I and II, by James Agate. Richard Aldington's *Wellington* failed to become the standard biography and Edmund Blunden published a learned but unadventurous book on Percy Bysshe Shelley. D. B. Wyndham Lewis wrote richly on Pierre de Ronsard, and also on James Boswell in *The Hooded Hawk*. Statesmen's lives were recorded in such "premature obituaries" as Trevor Evan's *Bevin* and R. Broad's *Winston Churchill, 1874-1945*. The most publicized biography of the year, Professor Keith Feiling's *The Life of Neville Chamberlain*, suffered from a prose style lacking the clarity which that statesman most admired. More notable, Sir Osbert Sitwell published the second volume of his autobiography, *The Scarlet Tree*, sustaining a delicacy of style appropriate to a record of a past age, and Bishop D. Mathew's *Acton: The Formative Years* was a major work on a great Victorian.

In *The Mind of Heart and Love* Father M. C. d'Arcy made an important contribution to religious psychology. Robert Graves and H. J. Schonfield treated learnedly of the beginnings of Christian history in *King Jesus* and *The Jew of Tarsus*. Historical works included Harold Nicolson's *The Congress of Vienna, a Study in Allied Unity, 1812-1822*, a title not without irony, the profound and moving *The Discovery of India*, by Jawaharlal Nehru and C. V. Wedgwood's *Velvet Studies*. Rose Macaulay's *They Went to Portugal* was a fascinating chronicle.

Forrest Reid published *Milk of Paradise*, essays on poetry ranging from William Wordsworth to Robert Bridges and Walter de la Mare; Professor L. C. Knights published *Explorations*, J. Lavin *An Introduction to the Russian Novel* and Dr. H. Granville Barker (who died in August) a preface to *Othello*. Other books included Roy Fedden's *Syria*, which was outstanding for its sympathetic and informed portrayal of a difficult country, Stephen Spender's report on Germany, *European Witness*, and C. Benn's *Mozart on the Stage*. Norman Douglas's *Late Harvest* appeared as a leisurely epilogue to his many works. Art books were more notable for their reproductions than their texts. Professor T. Bodkin, however, published *The Approach to Painting*, a work of sensibility save for aberrations in the final chapter.

The year was, above all, distinguished by the appearance of the long-awaited *History of Western Philosophy*; monumental and comprehensive, though in part controversial, it was worthy of Bertrand Russell's prestige. (See also AMERICAN LITERATURE; BOOK PUBLISHING.) (F. G. G.)

Entomology. The teaching of entomology in colleges and universities, like all other sciences, was greatly stimulated by the G.I. Bill of Rights following the close of World War II. As graduate students the veterans were a high type. They knew what they wanted and worked hard to attain their aims. These serious-minded, somewhat over-aged scholars, were making records such as had never been made before. They were the makings of what promised to be the best-trained and most reliable and conscientious group of Ph.D.'s ever graduated in the history of higher education. They raised the levels of graduate work and the standards of educational training and responsibilities.

What was apparently the first short course embracing pest

TURBINE BLOWER being used experimentally in July 1946 to spray trees with DDT insecticides for the control of gypsy moth caterpillars and other defoliating insects

control problems of sanitary inspectors and other public and private agencies interested in that general field was held April 29 to May 3, 1946, at Purdue university, Lafayette, Ind. There were 87 registrants from 17 different states. The school was under the direct supervision of Prof. J. J. Davis, head of the department of entomology.

Insects of the Year.—A nation-wide survey of the distribution of the potato tuber moth, *Gnorimoschema operculella* (Zeller), resulted in the finding of the insect in the field or in storage in 26 states. This was a much greater spread than had generally been realized and the report was expected to have an important influence in determining quarantine regulations governing the movements of potatoes in the future.

The lesser migratory locust, *Melanoplus mexicanus* (Sauss.), comprised about 75% of the locusts and grasshoppers which migrated over the entire areas of southern Arizona and Texas in the latter part of May. Cool rainy weather retarded development in southern California.

The development of the European corn borer, *Pyrausta nubilalis* (Hbn.), was ahead of normal the latter part of May in Indiana, Illinois, Kentucky and Iowa. Heavy infestations by the middle of July were reported in New York.

Severe infestations of the Hessian fly, *Phytophaga destructor* (Say), occurred in parts of Kansas, Oklahoma, Illinois and Kentucky.

Heavy infestations of the plum curculio, *Conotrachelus nenuphar* (Hbst.), were reported from parts of Georgia, North Carolina, Mississippi, Virginia, Kentucky, Indiana and Illinois with considerable abundance of the weevil in New Jersey, New York and Missouri.

The Mexican bean beetle, *Epilachna varivestris* (Muls.), was abundant and destructive in parts of Florida, Alabama, Georgia and South Carolina. Its northward distribution reached Long

Island, N.Y. It was discovered on beans in Ventura county, Calif., July 22, 1946. It was later found at considerable distances from the focal point of infestation and strenuous attempts were made to eradicate the insect. A new infestation was also found north of Gainesville, Fla.

The citrus white fly, *Dialeurodes citri* (Ashmead), was unusually abundant on gardenias in the Norfolk district of Virginia.

Several colonies of *Kaloterms snyderi* (Light), were found in Forrest county, Miss.

The European red mite, *Paratetranychus pilosus* (C. & F.), was most abundant and destructive on record in western New York. It was also abundant in fruit orchards in the Hudson valley, N.Y., and in New Jersey, Virginia, southern Indiana, western Kentucky, western Tennessee, northeastern Georgia and middle California.

An introduced species of thrips, *Dendrothrips ornatus* (Jabl.), was discovered on privet at College Park, Md.

A new infestation of the vegetable weevil, *Listroderes obliquus* (Klug), was discovered infesting tomatoes and tobacco at Murfreesboro, Tenn., in June.

Because of the drought several species of cutworms, including the red-backed cutworm, *Euxoa ochrogaster* (Guén.), and the pale western cutworm, *Agrotis orthogonia* (Morr.), were very injurious to wheat, barley and pear in Manitoba and Saskatchewan, Canada.

June beetles, *Phyllophaga anxia* (Lec.), and *P. fusca* (Froe.), were quite abundant and injurious in Ontario.

Wireworms, especially *Ludius aereipennis destructor* (Br.) and *Agriotes mancus* (Say), caused serious damage in western Saskatchewan and southern Ontario.

The sweet clover weevil, *Sitona cylindricollis* (Fabr.), heavily damaged sweet clover in northwestern Manitoba.

Flea beetles, *Phyllotreta* spp., and *Epitrix cucumeris* (Harris), were abundant and very injurious to field and vegetable crops in many parts of eastern Canada and were especially numerous on Prince Edward Island.

The elm leaf beetle, *Galerucella xanthomelaena* (Schränk), found for the first time at St. Catharines, Ontario, had spread more than a mile in extent.

The satin moth, *Stilpnotia salicis* (Linn.), increased its spread and injury in New Brunswick. The introduced parasite, *Apanteles* sp., was increasing rapidly and following the progress of the moth.

The forest tent caterpillar, *Malacosoma dissstria* (Hbn.), and the western tent caterpillar, *M. pluvialis* (Dyer), were prominent and destructive in western and south central Canada.

The hemlock looper, *Lambdina fiscellaria lugubrosa* (Hulst.), caused severe defoliation of west coast hemlock and Douglas fir in the coastal areas of British Columbia.

One of the heaviest infestations for many years of the larch casebearer, *Coleophora laricella* (Hbn.), occurred throughout southern Ontario.

The worst outbreak of the black fly, *Simulium arcticum* (Mall.), in the history of the cattle industry in Saskatchewan, occurred in the first half of June. Losses from sickness and death were heavy.

A severe and destructive locust invasion occurred in Sardinia during the summer of 1946. The Moroccan locust, *Dociostaurus moroccanus* (Thunberg), which occurs throughout the Mediterranean region and ranges east into northern Persia and Turkestan, has often wrought devastation in those areas. Clouds of winged adults were still to be seen in August after which the locusts disappeared. It was estimated that one-tenth of the grain crop was destroyed by the insects. To assist the Sardinians in their struggles to save their crops, the United Nations

Relief and Rehabilitation administration provided nearly 300 vehicles and flew supplies of the deadly new insecticide gam-mexane or "666" from England.

Insecticides.—DDT (dichloro-diphenyl-trichloroethane) and sabadilla, rarities two years previously, were among the regulars in 1946. DDT was generally used throughout the U.S. during the year for codling moth on apples and pears; oriental fruit moth on peaches; bollworm on cotton; lima bean pod borer on bush lima beans; grapeberry moth on grapes; Colorado potato beetle and flea beetles on potatoes; insects attacking livestock and poultry (flies, mosquitoes, lice, fleas, sheep ticks, etc.); household insects (flies, mosquitoes, lice, silverfish moths, cockroaches, ants, etc.); grape leaf hopper, beet leaf hopper, lygus bugs on alfalfa, cotton, lima beans and other field crops; onion thrips, bean thrips, grass thrips, citrus thrips and many other insects.

Never before had there been so many insecticide formulations for the treatment of livestock and pests for the control of flies, mosquitoes, lice, mites, ticks, etc. These included (1) DDT, usually applied at 2.5% dilutions as wet-table water sprays and dips. Oil sprays were being extensively advocated for the same purpose although there was some evidence of injuries caused by these oil-soluble materials. DDT was also applied as a smoke or vapour directly to the animals and to buildings and pastures—the latter chiefly for the elimination of mosquitoes. (2) DDT was being extensively recommended for the treatment of livestock. (3) Lethane, in many formulations, was being widely tested and used for livestock sprays as well as for general insecticides and fungicides.

Velsicol 1068 was a new insecticide which gave promise for the control of household insects as well as for the control of some insects infesting agricultural crops.

Hexachlorocyclohexane (benzene hexachloride, gammexane, or "666") was one of the favoured new insecticides in Great Britain. It had been extensively experimented with in North America and elsewhere for two years. It was therefore becoming better known and its place as an insect spray and dust was gradually being determined. Its disagreeable odour, which had not yet been successfully eliminated, restricted its uses on berries, fruits, leafy vegetables and similar crops.

Thanite and Thanasol 70 are water-miscible sprays especially designed for livestock. Mixed with DDT they were recommended for a quick knockdown of flies in barns, milkhouses, warehouses and human habitations.

Following the cessation of hostilities the insecticide situation cleared somewhat. The most noticeable deficiencies during 1946 were nicotine and rotenone compounds. The adoption of DDT was most rapid—so much so that the large war stock pile was apparently completely depleted and after mid-summer the material was at times difficult to obtain. The small package trade in this material was unprecedented. In California alone more than 500 different trade brands were offered for sale by almost every type of retail business throughout the entire state. A similar situation occurred throughout the United States.

According to the Nov. 1946 reports, the supply of various insecticides for the winter of 1946-47 was as follows: borax—adequate; calcium arsenate—uncertain; calcium caseinate—tight; cresols and cresylic acid—tight; cryolite—tight; DDT formulations—adequate; dinitro compounds—tight; fish oil soaps—tight; cyanide—adequate; ethylene dichloride—tight; methyl bromide—adequate; chloropicrin—adequate (but tightening); carbon bisulphide—tight; paradichlorobenzene—tight; carbon tetrachloride—tight; lead arsenate—tightening; nicotine—tight; oils (soluble and spray)—adequate; Paris green—adequate; phenols—tight; pyrethrum—ample; rotenone—improving; sabadilla—critical; sulphur—adequate; wettable spreaders, dispersants and emulsifying agents—tight.

Fumigants.—Methyl bromide continued to gain favour for fumigating plant materials such as nursery stocks, potatoes, vegetables, fruits, stored cereals, nuts and seeds, and for rodent control. Its handling and application had been made safer and greatly simplified by many types of easily-regulated containers.

An emulsion of the fumigant, dichlorethylether, was being recommended for dormant soil treatment for the control of the plum curculio and other subterranean insect larvae; in a water solution for wireworms, white grubs, sodworms, and lawn moths and in a mineral oil for corn-ear worm control.

Ethylene dibromide was rapidly gaining favour for the control of wireworms and nematodes in the soil. Specially-constructed powered soil applicators enable the effective treatment of large acreages of bare land.

The following fumigant mixtures were found useful: (1) a mixture of ethylene or propylene dichloride with carbon tetrachloride and methyl bromide, especially for bulk storage of grain, beans, peas and other seeds; (2) a mixture of ethylene dichloride (75%) and carbon tetrachloride (25%) for grain and seeds; (3) a mixture of methyl bromide in combination of some of those indicated above for soil treatment; a mixture of dichloropropane-dichloropropene for soil nematodes; the last two mixtures dissipate rapidly and will permit planting within 4 or 5 days; (4) ethylene oxide and carbon dioxide were extensively employed for industrial fumigation.

Ethylene dichloride emulsions were successfully used for the control of the eastern peach tree borer and for other wood borers and as soil fumigants.

Outstanding New Entomological Publications.—*Insect Pest Survey*, U.S. department of agriculture bureau of entomology and plant quarantine, was well under way again; S. J. Carpenter, W. W. Middlekauff and R. W. Chamberlin, "The Mosquitoes of the Southern United States East of Oklahoma and Texas," *Am. Midl. Nat. Mon.*, No. 3; Edward A. Steinhaus, *Insect Microbiology*; Cynthia Westcott, *The Gardener's Bug Book*; R. A. Kellogg, "A Century of Progress in Smithsonian Biology," *Science*, 104, No. 2693, 132-141 (Aug. 9, 1946). The National Research council, Insect Control committee, Washington, D.C., issued a number of important abstract bulletins dealing especially with insecticides and their uses in the control of insect pests and rodents. (E. O. E.)

Epidemics and Public Health Control.

Viral infections of the respiratory tract may be spread by direct contact and by air-borne transmission since the virus may float in the air. This latter means of spread is more common. The viral diseases may attack any part of the respiratory tract. A final classification of viral diseases could not be made with the limited knowledge available up to the close of the year. Except for influenza, specific preventive measures were not available. Specific therapeutic measures did not exist for the entire group. Management had to be suited to the needs of the patient.

Army and navy statistics for World War II revealed a total of 572,950 reported admissions for malaria. If reporting were complete there would probably have been closer to 1,000,000 admissions. Outstanding developments were:

(a) Quinacrine hydrochloride which afforded complete protection against *Plasmodium falciparum* and temporary protection against *Plasmodium vivax*. However, it stained the skin and needed daily administration. (b) Chloroquine needed only weekly administration, did not stain the skin. It afforded complete protection against *falciparum* and temporary protection against *vivax*. (c) There was still a need for a drug for the *vivax* type. Searches were being made. The drugs developed by the end of 1946 had certain disadvantages.

W. J. Morginson reviewed the literature on penicillin and pointed out that the drug might produce toxic reactions as: (a) direct toxin and primary irritant, (b) antigen, (c) therapeutic shock excitant and (d) indirect action on pathologic processes. It seemed from this article that penicillin should not be used indiscriminately (as it was sometimes used).

Lewis B. Flynn, *et al.*, in an excellent study pointed out that para-aminobenzoic acid was found effective in the treatment of ten cases of Rocky Mountain spotted fever. Controls were used for comparison. Other rickettsial diseases were favourably treated with this drug.

Regarding the antibiotic drugs, there was a large decline in mortality of the degenerative cardiac, renal and other diseases as a result of the control of incidental infections.

Penicillin, as distributed in 1946, contained about 95% G. There were at least four chemical types, G, X, F and K, which appeared in varying combination and proportion. Strains of group A haemolytic streptococci, pneumococci, gonococci and meningococci were from two to eight times more sensitive to the penicillin X than to penicillin G.

Streptomycin seemed to be of most value when used for certain infections of the urinary tract with gram-negative bacteria, for clearing the intestine temporarily of certain gram-negative bacteria, for tularaemia, for *Haemophilus influenzae* meningitis, for bacteraemia with gram-negative bacilli and for certain infections of wounds.

Streptomycin seemed to have a limited suppressive effect in tuberculosis. Other antibiotic substances were being investigated in tuberculosis such as mycoidin which has a bactericidal effect on this germ.

Determination of the means of spread of poliomyelitis continued a confusing problem. Several publications tended to clarify the doubt, including the work of A. E. Casey, W. I. Fishbein and H. N. Bundesen, which showed the probability that poliomyelitis was highly contagious in children under three and one-half years and that patient-to-patient contact was the biggest factor in the spread.

Gamma globulin was found effective in prevention of infectious epidemic hepatitis. (See also BACTERIOLOGY; ENTOMOLOGY.)

ATTENDANT preparing serum in a public health tent on a Tokyo street in 1946. For a nominal charge residents could have chest X-rays and be immunized for cholera, tuberculosis, whooping cough and smallpox. It was part of a program set up by the Metropolitan Rehabilitation league and the Association for Tuberculosis Prevention, assisted by medical students of the Japanese Doctors federation

Estonia. One of the Baltic states of northeastern Europe, north of Latvia, south of Finland, 16th republic of the U.S.S.R. Area, 18,371 sq.mi.; pop. (est. 1939) 1,122,000.

Chief towns: Tallinn (capital, 146,400); Tartu (60,100); Narva (24,200); Nõmme (19,700); Pärnu (21,500). Language, Estonian, a Finno-Ugrian tongue. Religion, Christian (Lutheran 78%, Greek Orthodox 19%). Chairman of the council of ministers in 1946: A. Veimer.

History.—Estonian citizens both at home and abroad continued to live in an anomalous situation through 1946. Internally Estonia functioned as the 16th republic of the U.S.S.R., yet both Great Britain and the U.S. carefully refrained from recognizing this sovietized status of Estonia and its sister Baltic republics of Latvia and Lithuania, and many of the Estonian diplomats of the independent state of 1939 continued in their positions abroad.

The shuttle of fate had indeed dealt strangely with the small republic. The U.S.S.R. demanded strategic bases in the country on Sept. 29, 1939, and occupied the land in June 1940. Elections of July 1940 approved the entry of Estonia into the U.S.S.R. A year later German armies overran the country. By Nov. of 1944 the soviets had reconquered the land from the Germans and the position of 1940-41 was resumed. The soviets felt that the elections of 1940, plus the previous centuries of Russian rule in Estonia, fully justified the new arrangements. But many of the people, passionately attached to independence, abhorred the soviet as well as the German control. Hundreds had escaped to Sweden during the war; thousands had gone in forced labour groups to Germany. The United Nations Relief and Rehabilitation administration estimated that in 1946 there were 29,978 Estonians in the U.S., French and British zones of occupied Germany—and most of these men and women did not want to return to soviet Estonia. Further unknown numbers had been transported into central Russia and Siberia during 1940-41 and later.

Particularly dramatic was the flight to the U.S. from Sweden of 47 Estonian refugees and one Finn. They sailed in small boats: the 38-ft. sloop "Inanda" arrived Aug. 21 at Miami, Fla., with 18 persons aboard; the 40-ft. "Brill" arrived on Sept. 19 with 12; the "Linda" reached port on Sept. 28 with 18. Men, women and children had crossed the Atlantic safely by the southern route. Immigration laws then denied them entrance to the U.S. and for weeks they waited until Pres. Truman, spurred on by aroused public sentiment, on Nov. 2 authorized the little band to stay until "in due course" immigration visas could be obtained for them. Sixteen others had in similar fashion reached Norfolk, Va., on Dec. 15, 1945. Gifts of canned goods, fruit and milk piled up; offers of jobs and land were numerous; and a Miami woman fell in love with one of the men and married him. The courage and faith of the group had won the hearts of the U.S. people.

Education.—There were 1,224 elementary schools, 58 middle schools, 39 technical schools and 30 agricultural schools in 1937-38. Tartu (the former famous Dorpat) university had 3,219 students and 217 professors. Despite wartime disintegration the soviet regulations continued to require universal education.

Trade and Communication.—Imports in 1939 totalled 101,351,000 kroons (the kroon at par was worth 26.7 U.S. cents); exports in 1939 were valued at 118,217,000 kroons. Principal imports were raw cotton, sugar, woollen yarns and thread, iron and steel. Principal exports were butter, wood, paper, cotton goods, cellulose, flax and tow, meat products and eggs. Imports were chiefly from Germany, Great Britain, Sweden, the U.S. and the U.S.S.R. Exports went chiefly to Great Britain, Germany, Finland, the U.S. and Sweden.

Agriculture.—Production of the leading crops for the year 1940-41 was as follows: wheat, 760,000 quintals; barley, 830,000; rye, 1,910,000; oats, 1,480,000; potatoes, 10,470,000. As

of 1938 the livestock census listed: cattle, 660,890; sheep, 649,730; pigs, 384,580; horses, 219,020; chickens, 1,596,570. There were 40,000 landless peasants reported to have received land in 1945-46.

Manufacturing and Mineral Production.—The value of all manufactured goods in 1937 was 166,238,000 kroons, nearly one-third of which was the product of the great cotton mill at Narva. One of the first postwar projects was to get at least 25,000 spindles of that plant operating again; it was one of Europe's largest mills. Shale oil production had risen rapidly to 209,437 short tons in 1939. Approximately 60,000 people were employed in industry in 1938. Industrial production in 1946 was reported up 58.4% above 1945, and electric power was greater than prewar.

As in Latvia, great efforts were being made in 1945 and 1946 to rehabilitate industry, and factories, shipyards, lumber mills and machine plants were resuming operation.

Etching. With the return of artists all over the world from military service to civilian life, 1946, the first postwar year, showed a marked increase of activity in the field of etching, as in all other branches of pictorial art. Societies which had virtually suspended operation during the war years resumed their usual functions, exhibitions that had been given up were renewed and multiplied and publication of new work was made by many artists of established reputation who had long been absent. Although the art of etching reflected the altered conditions attendant upon a return to normalcy, the change was less generally apparent in it than in other forms of creative expression. An examination of the whole history of the art from the 16th century to the present day will reveal that this was natural and consistent. Of all forms of graphic art it is, by the very nature and process of the medium, the most highly technicalized and therefore the more difficult of mastery. Its very exactions tend to discourage the would-be worker in its field and only the serious minded who possess a natural affinity for the process and for its particular form of expression are drawn to it and remain to adopt it as their chosen medium.

With the great and determining role the U.S. played in the universal upheaval that was World War II, the advent to its shores of so many artists of various nationalities, the availability of materials and facilities denied to artists of other lands and the variety and unlimited range of subject matter offered by it, that country became, in 1946, virtually the capital of the world in graphic art. Etching, however, changed little, for, though the freest and therefore the most autographic of all the pictorial arts, the technical difficulties of the medium render it less susceptible to influences of the moment than are others at the service of the more casual and undisciplined worker. Hence the so-called "modern" movement has found many more supporters and practitioners among serious artists in other fields than it has in that of etching, which, of all, has most consistently conformed to a single great tradition throughout its history.

The usual large national print exhibitions were held in the U.S. during 1946, with that of the Library of Congress, open to printmakers working in all media, and of the Society of American Etchers, open to workers in those of the metal plate only, being the most comprehensive and representative. A newly organized national print competition, sponsored by the Associated American Artists, provided a fresh stimulus to the increasingly widespread interest in, and appreciation of, the art. More regional exhibitions were conducted by the Chicago Society of Etchers, the Southern Printmakers, the Print Makers Society of California, the Northwest Printmakers, the California Society of Etchers, the Prairie Print Makers and others. There was

"BROOKLYN LANDSCAPE" by Stephen Csoka was the Society of American Etchers associate membership presentation print for 1946

apparent in these exhibitions, as was the case after World War I, a reaction against subjects inspired by the war and by social consciousness, and a return to more traditional subject matter.

The world of American etching lost three distinguished representatives in 1946 in the persons of Kerr Eby, Frederick G. Hall and Albert Sterner, the last named one of the oldest practising printmakers in the country. Outstanding among American etchers during the year were Isabel Bishop, Cornelis Botke, Samuel Chamberlain (but recently returned from military service overseas), Federico Castellon, John E. Costigan, Stephen Csoka, Ralph Fabri, Isac Friedlander, Sue Fuller, Douglas W. Gorsline, Elias M. Grossman, Harold M. Hahn, Stanley W. Hayter, Arthur W. Heintzelman, Eugene Higgins, Irwin D. Hoffman, Alfred Hutty, Max Jaediker, Gene Kloss, Luigi Lucioni, Blanche McVeigh, J. Jay McVicker, Jackson Lee Nesbitt, Martin Petersen, Fermin Rocker, Ernest D. Roth, Carl M. Schultheiss (equally eminent in the field of engraving), Sam Thal, Reynold H. Weidenaar, Keith Shaw Williams and George H. Wright.

The loss of Sir Frank Short and Sir David Young Cameron, coupled with the transfer of James McBey to U.S. citizenship, left vacancies in the ranks of British etchers not likely to be filled. However, many outstanding performers remained to carry on the great tradition and high standards of the English school in 1946, among them the veterans Winifred Austen, Robert Austin, Katharine Cameron, Paul Drury, W. Russell Flint,

H. A. Freeth, Sydney Lee, W. Westley Manning, W. P. Robins, D. I. Smart, Eric Taylor and Henry Wilkinson. More recent in the field were John M. Aiken, Anna Airy, Ruth Aspden, Wendela Boreel, Denise L. Brown, Eveleen Buckton, R. E. J. Bush, Alan Carr, Esmé Currey, W. D. Brokman Davis, Greta Delleany, R. Stanley G. Dent, E. G. Earthrowl, W. Fairclough, R. R. Gill, E. H. Groom, Jean Harper, Hazel W. Harrison, Erlund Hudson, Gwen May, John C. Moody, John Nicholson, Russell Reeve, Marion Rhodes, R. Spence, C. H. Spencer, Sara Sproule, C. W. Taylor, E. Heber Thompson, Harold Thornton, and Leslie Ward. The two principal annual British print exhibitions, those of the Royal Academy and the Royal Society of Painter Etchers and Engravers, the latter including in its ranks all the more important etchers of the country, took place as usual.

After the cessation of hostilities French etchers were very active, though many of them, like the burinists, were chiefly engaged in book illustration. H. G. Adam, Yves Alix, Jean Deville, Anthony Gross, Joseph Hecht, André Jacquemin and Charles Walch, all members of "La Jeune Gravure Contemporaine," published independently in 1946.

The Society of Canadian Painter-Etchers, under the able and progressive leadership of Nicholas Hornyansky, and with headquarters in Toronto, continued its normal activities in 1946. Prominent etcher members were Wendell P. Lawson, Wilbur K. Peacock, Dr. E. B. Sisley, Harry D. Wallace and W. J. Wood. A truly national group, these artists did much to bring to their fellow countrymen not only a consciousness of fine prints but

also a greater realization of the unusual natural beauties of their land.

Conditions were still too chaotic throughout the rest of the world for any appreciable amount of significant work in bitten line to emerge from the afflicted countries, though a considerable group of etchers in Sweden, a few in Norway and isolated individuals in Italy, Australia, Mexico, Uruguay and Argentina, produced interesting prints during the year. (J. T. AR.)

Ethical Culture Movement. A religious and educational movement emphasizing the centrality of ethics in human relations, started in New York city in 1876 by Felix Adler, and established ten years later in London by Stanton Coit. In 1946 societies were active in New York city, Westchester, Brooklyn, Philadelphia, St. Louis and Chicago, and groups were meeting regularly in Washington, D.C., and New Jersey. There were four societies meeting in London and one in Birmingham, England. Contact was re-established with the remaining members of the Vienna society which, as was the case with the Berlin group, had been suppressed by the nazis.

The Ethical Culture societies conduct Sunday and weekday services and a variety of educational and community activities. University Settlement, the first neighbourhood house in the United States, was an enterprise of the movement, which was also responsible for significant efforts in child labour reform, visiting nurse associations, legal aid societies, housing, race relations, child study and progressive education. During the year the movement celebrated its 70th anniversary with special conferences and institutes on religion and public education, labour-management problems and international relations. The English and U.S. societies devoted themselves to training of youth for democratic citizenship, spearheaded in the U.S. by a six-weeks' Encampment for Citizenship. This encampment, held at the Fieldston school of the Ethical Culture schools in New York, brought together young people of diverse religious, national, economic and educational backgrounds from all parts of the country, and was devoted to intensive study and discussion of key problems and techniques of democratic living. Extensive programs in adult education, fuller realization of Negro rights and efforts aimed at the improvement of the public school system were among the activities of the various societies. The Conference on the Scientific Spirit and Democratic Faith held its annual meeting at the meetinghouse of the New York society.

Exposition of the movement's principles was to be found in Felix Adler's *An Ethical Philosophy of Life*, David Saville Muzzey's *Ethical Religion* and Horace J. Bridges' *Some Aspects of Ethical Religion*. *The Standard*, edited by George E. O'Dell, was published each month at 2 West 64th St., New York 23, N.Y. The American Ethical union, of which Robert D. Kohn was president in 1946, had offices at the same address. The offices of the English Ethical union, of which John Laird was president, and H. J. Blackham executive secretary (1946), were at 4A Inverness Terrace, London W2. (J. NN.)

Ethiopia. A kingdom of northeast Africa. Area: c. 350,000 sq.mi.; pop. (est. Dec. 31, 1939): 9,500,000; cap. Addis Ababa; religion: Christian (Copt) and Mohammedan; languages: Amharic and Arabic; ruler: Emperor Haile Selassie I.

History.—Ethiopia made great progress during 1946. A Land act, establishing a single tax and abolishing all feudal charges, and an agricultural credit bank opened a new era of prosperity for the peasant. Industry advanced and exports increased. Ethiopian National Air lines, for internal and external transport, were established. The national revenue reached £5,000,000.

Ethiopia was represented at United Nations conferences in

London and New York. At the Paris Peace conference it was awarded £6,250,000 reparations from Italy. Its delegates claimed the ex-Italian colonies, Eritrea and Somaliland, formerly Ethiopian provinces, and presented a memorandum showing how they would be administered under Ethiopian government. Great demonstrations for this reunion assembled repeatedly in Ethiopia and in the ex-colonies. Ethiopia presented 110,000 short tons of cereals and 66,000 short tons of coffee to U.N.R.R.A.

Emperor Haile Selassie laid the foundation stone of the Princess Tsehaye Memorial hospital on June 6, and on July 23 unveiled a memorial to Bishop Petros, who was executed by the Italians for refusal to sign an act of submission.

Ethiopia became an independent archbishopric of the Alexandrine Christian church and would elect its own patriarch. A Holy Synod was to be formed in Ethiopia. The archbishop of York visited Addis Ababa bearing a letter of greeting signed by himself and the archbishop of Canterbury.

Appointments included: Ras Imru, the emperor's cousin, to be Ethiopian minister in Washington; Blatta Ephrem Medhen, minister in London; Ato Tesfaye Tegagne, minister in Paris; Ato Makonnen Desta, president of the chamber of deputies; Ato Abeba Retta, minister of health.

Education.—Scholars in government schools (May 1946) 34,000; in Ethiopian Christian church schools 47,500. Government schools were elementary, secondary (seven in Addis Ababa alone), teacher-training, commercial, technical, arts and crafts, agricultural and theological.

Trade and Communication.—Chief exports: hides and skins, coffee (14,300 short tons in 1937–38) and gold. Roads (1940) c. 4,340 mi.; railways (Addis Ababa to Jibuti in French Somaliland) 486 mi. (E. S. Pr.)

Evatt, Herbert Vere (1894–), Australian statesman, was born April 30, in East Maitland, New South Wales. He studied at St. Andrew's college and won his degree as doctor of philosophy from Sydney university in 1924. He practiced law in New South Wales, became justice of the federal high court of Australia and left the bench in 1940 to enter politics. Elected to the Australian parliament on the Labour party ticket (1940), he was appointed attorney general and minister of external affairs in the first Curtin cabinet in Oct. 1941.

During World War II he insisted on Australia's right to sit in the Pacific War council as a co-equal to Britain and the U.S. He was the Australian delegate to the United Nations conference in San Francisco in 1945 and soon established himself as a champion of the small "voiceless powers" and as a vigorous critic of the veto, and on Nov. 16, 1945, he called for a "more democratic procedure."

In 1946 Evatt attended the U.N. conferences in New York and the Paris peace conference, at which he continued his campaign against the veto. Later, he emphasized that while he was not opposed to the principle of unanimity itself, he did object to what he termed the abuse of the veto in practice.

Events of the Year: see CALENDAR OF EVENTS, 1946, pages 1–16.

Exchange Control and Exchange Rates.

Although 1946 was a year of relative stability in exchange rates, it was amply evident that the dollar value of many cur-

rencies was maintained only by means of strict controls which marshalled the supply of foreign exchange and rationed its use. It was also evident that the need for such controls in some countries might become greater once the sellers' market in world trade disappeared unless adjustments of exchange rates were made. Considerable attention, therefore, was focused on the establishment of the International Monetary fund and on its decisions concerning the initial par values of the currencies of member countries. A first step in the direction of greater convertibility of currencies was taken with ratification of the Anglo-U.S. financial agreement.

Several exceptions to the general condition of stability occurred during the year. Most notable among these were the hyperinflation in Hungary, which was brought to an end by the establishment of a new currency; continued severe depreciation of the currencies of Rumania and China; downward adjustments in the value of the Greek drachma, Italian lira and Turkish pound and, in sharp contrast to these, the increasing strength of the Canadian dollar and Swedish krona, which led to a writing up of their exchange value.

On Dec. 18 the International Monetary fund announced that it had

accepted initial par values based on existing exchange rates for all but 9 of its 39 member countries. Eight countries—Brazil, China, the Dominican Republic, Greece, Poland, Yugoslavia, France in respect to French Indo-China and the Netherlands in respect to the Netherlands Indies were granted more time to determine their initial par values; and decision on the ninth, Uruguay, was postponed "pending the completion of certain legislative proceedings" in that country. In its statement announcing these decisions the fund recognized that in many instances existing exchange rates did not serve to equilibrate national price and wage levels and that subsequent exchange adjustments might be required. The price disparities involved at existing rates were regarded as of little significance, however, so long as they did not serve as a brake on exports. Moreover, imports for reconstruction were so badly needed by many countries that selective controls were preferable to the blanket effect of raising the price of foreign currencies. Such countries were usually faced also with the danger of internal inflation, which would only be aggravated by currency devaluation. Finally, it was expected that price disparities would tend to diminish as productivity was restored in the war-ravaged countries. Exchange rate adjustments could, therefore, be made more wisely and with greater benefit after this transition period was completed.

The fund announced that it would begin exchange transactions on March 1, 1947, at the initial par values indicated. It was likely that the fund would have to meet a strong demand for U.S. and Canadian dollars. The theoretical limit on drawings from the fund during the first 12 mo. of operations would be \$760,000,000, or its equivalent in other currencies (excluding the drawing rights of the United States, Canada, United Kingdom and Union of South Africa, countries which might be regarded as least likely to exercise their rights). This figure would be increased as new members were accepted into the fund—the immediate entrance of Italy, Turkey, Syria and Lebanon being conditional only upon legislative action within each country.

Establishment of the fund did not mean that all exchange controls were to be abandoned. On the contrary, the articles of agreement authorized "such controls as are necessary to regulate international capital movements," providing payments for current transactions were not restricted (and the latter limitation might be held in abeyance during the postwar transitional period and subsequently be lifted under special circumstances). A number of member countries, therefore, made arrangements in 1946 for placing emergency controls on a more permanent basis—among them Canada, Czechoslovakia and the United Kingdom. The agreement not to restrict the availability of exchange needed for current transactions would in some cases probably lead to greater use of direct import licensing systems, and accordingly it was sought to limit such practices through the proposed International Trade organization.

The Fund Countries.—The United States.—Although the United States initiated no exchange rate changes in 1946 (the dollar price of gold remaining at \$35 per ounce, as communicated to the International Monetary fund on Sept. 18), adjustments made in July by 2 other countries, Canada and Sweden, were primarily for the purpose of writing down the value of the U.S. dollar in terms of their own currencies. This was a consequence of the actual and threatened further rise of internal prices in the United States. Many currencies, however, appeared to be overvalued vis-à-vis the dollar, and the rapid rise of prices in the United States served merely to lessen the degree of overvaluation. Because the United States remained the chief supplier country in the world, the dollar continued to be in great demand and was probably the most widely accepted currency. Par values announced by the fund on Dec. 18 were expressed both in terms of gold and of U.S. dollars, the latter having come to be regarded as an international standard of value.

The list of foreign currencies regularly quoted in New York was expanded during 1946 to include again Czechoslovakia, Denmark, Norway, Portugal, Spain, Sweden and Switzerland. Regular quotations for most central European

Table I.—Initial Currency Par Values For Members of the International Monetary Fund*

Country	Currency	Currency units per U.S. dollar	Country	Currency	Currency units per U.S. dollar
Belgium	Franc	43.8275	India	Rupee	3.30852

and far eastern currencies were not available.

Foreign short-term dollar balances in the United States (net) declined from \$6,490,000,000 at the end of 1945 to \$5,888,000,000 on Aug. 31, 1946, reflecting the adverse commercial trade balance which the rest of the world had with the United States (\$1,761,000,000 during the first 8 months of 1946). In addition to this decline of \$602,000,000 in foreign-held dollar balances there occurred a net liquidation of long-term U.S. securities held by foreigners in the amount of \$307,000,000. Europe, Canada and Asia together more than accounted for the total decline in both types of dollar assets but were partly offset by Latin America's gains. During the same period the United States added \$278,000,000 to its gold holdings from foreign sources and paid out \$970,000,000 on government credit to foreign countries (excluding lend-lease "pipe-line" and surplus property credits). It seemed apparent that U.S. government lending supplied an important part of other countries' dollar requirements for commercial imports.

Additional dollar funds were made available for use by the unfreezing of assets in the United States belonging to the Netherlands, Czechoslovakia, Luxembourg, Denmark, the Philippines, Greece, Switzerland and Liechtenstein. By the end of the year the only countries whose assets in the United States remained entirely blocked were Germany, Japan, Portugal, Spain, Sweden and Tangier. Countries permitted to transfer the proceeds of current transactions, but not, without special licence, existing assets, included Albania, Austria, Bulgaria, the Baltic countries, China, Hungary, Italy, Poland, Rumania, Turkey and Yugoslavia. Polish assets were to be released entirely as of Jan. 7, 1947, as the result of an agreement announced on Dec. 28. China and Turkey were to be added to the free list on the first day of 1947.

Canada and Newfoundland.—One July 6 the Canadian dollar (which was also the currency of Newfoundland) was restored to parity with the U.S. dollar for the first time after 1939. This involved an appreciation of the Canadian dollar's official exchange value from about 91 to 100 U.S. cents, an increase of about 10%. The timing of this adjustment was clearly influenced by the expiration of price control authority in the United States on June 30. Together with the retention of domestic price and rent controls (wage controls were lifted on Nov. 30) revaluation undoubtedly helped to prevent the spread of rising prices from the United States to Canada. Through the first 10 mo. of the year, the Canadian general index of wholesale prices rose by only 6%, compared with a rise of 25% in the United States. The dampening effect on Canadian exports, which might ordinarily be expected from exchange appreciation, was hardly operative during a year when Canadian products were in such great demand; in fact, the higher price for Canadian currency put upward pressure on world prices of some important Canadian exports such as woodpulp. In order to diminish the adverse effect of a lower price for gold on Canada's important gold-mining industry, however, it was necessary for the government to reduce certain taxes and minting charges.

One of the factors which had contributed to the strength of the Canadian dollar was the very substantial influx of capital funds from the United States. Net withdrawals by U.S. investors for the purpose of profit-taking after the revaluation were probably not substantial but may have partly accounted for the decline in the free rate for the Canadian dollar in New York, following its initial rise from 91 to 98 U.S. cents. Exchange control regulations prevented capital withdrawals except in Canadian currency, and the full effect of such withdrawals, therefore, was felt in the New York free market, rather than on Canada's official reserves of foreign exchange. The free rate in New York dropped during the course of the remaining months of 1946 to as low as 95 cents, which for a time gave rise to devaluation rumours.

Foreign exchange control, begun in Sept. 1939, was used in 1946 principally for controlling capital movements. In August the parliament authorized its continuance until 1949 by passing the Foreign Exchange Control act, to be effective Jan. 1, 1947. Under new regulations, effective the same date, sterling was to be acceptable in payment for exports to members of the British commonwealth and to about 22 other countries, including the United States, from which payment in U.S. dollars was previously required.

Substantial government credits were extended to a number of foreign countries, including \$1,250,000,000 (of which perhaps half was disbursed in 1946) to the United Kingdom, and lesser amounts to France, the Netherlands, Belgium, Norway, China and the Netherlands Indies. Canada's trade deficit with the United States (\$354,000,000 through September) was financed partly by drawing down dollar reserves and partly by exporting both new gold and gold acquired from other countries.

Latin America.—All but 2 Latin American countries had joined the International Monetary fund by the end of 1946, Cuba, El Salvador, Nicaragua and Panamá having entered in March, and Venezuela on Dec. 30 (bringing the total number of member countries to 40).

Latin American exchange rates remained generally stable throughout 1946, supported in some cases by favourable trade balances and in others by drawing down part of the generally large accumulations of reserves. All countries except Cuba, the Dominican Republic, El Salvador, Guatemala, Mexico and Panamá continued to exercise control over foreign exchange transactions, and in several cases such control was tightened. The demand for most Latin American export commodities continued strong, but several countries encountered exchange difficulties as a result of crop failures and strikes and of the greater availability of imports. The general level of prices continued to rise in nearly all countries, although in most cases by less than in the United States. The effect of higher prices for goods imported from the United States would probably be noticed more in the early part of 1947.

Brazil, with an export surplus and rising reserves of gold and foreign exchange, undertook to abolish her system of multiple exchange rates which had prevailed from 1939. In February the amount of foreign exchange required to be delivered by exporters to the Bank of Brazil at the official rates was reduced from 30% to 20% of the proceeds from

their exports, and the "special free market" was abolished. The tax on exchange sales was reduced from 5% to 3%. On July 22 the official market was abolished, and thereafter only a single, free market rate was quoted. It was announced that the purpose of this move was to conform with the Bretton Woods agreement. The tax on exchange sales was also entirely eliminated in July. The net effect of these changes, and of a subsequent movement on the free market, was an almost 7% increase in the exchange value of the cruzeiro for buyers of foreign currencies and a 4% increase in its cost to sellers of foreign currencies (the decrease in the spread between buying and selling rates being the result of abolition of the tax). The Bank of Brazil continued to transact the majority of exchange business and was in a position to wield considerable influence over the free market rate.

The demand for Brazilian exchange was partly met by Brazilian government credits extended in 1946 to France, Finland and Czechoslovakia. As a means of immobilizing excess purchasing power after July 31 Brazilian exporters were required to accept treasury bills for 20% of the f.o.b. value of their exports. Import permits, where required, were granted freely, and after Aug. 26 there were no restrictions on the repatriation of foreign capital or on the remission of interest, profits or dividends to foreign investors.

Chile, Uruguay and Venezuela continued to use multiple exchange rate systems. Of the 4 types of rates quoted in Chile the so-called *disponibilidades propias* ("D.P.") (private funds) rate of 31 pesos to the dollar was most generally applicable and was used as the basis for establishing the initial par value of the currency by the fund. Chile lost a considerable amount of gold and foreign exchange during the year, the result primarily of strikes in the copper and nitrate mines, and found it necessary to maintain fairly stringent exchange controls. In December Argentina extended to Chile a credit of 700,000,000 Argentine pesos (roughly \$175,000,000). Separate rates for imports and for other purposes prevailed in Uruguay throughout the year. Venezuela's system of exchange control, with its wide range of buying rates applicable to the proceeds of different types of exports, remained substantially unchanged. Determination of the Venezuelan currency's initial par value by the fund was to be made in 1947.

Bolivia, like Chile, suffered a drain on its international reserves and continued tight control over imports and foreign exchange. Exchange control regulations in Colombia were relaxed somewhat in February, but at the same time direct import controls were tightened. Costa Rica, faced with a large balance of payments deficit (owing to heavy imports as goods became more available, the decline of U.S. government expenditures in Costa Rica and a poor coffee crop), reimposed exchange rationing in June in an effort to stop the loss of its reserves.

Ecuador raised the cost of foreign exchange by doubling (to 4%) the tax on exchange sales in February and by further increasing the tax by one sucre per dollar in May. The effective selling rate thus reached 15.04 sucres per dollar, although the official rate (on the basis of which the currency's initial par value was established by the fund) was 13.50 per dollar. Because of an unsatisfactory sugar crop, a decline in such exports as balsam and rubber and of large imports, Ecuador had to use part of its gold and foreign exchange holdings to meet a balance of payments deficit.

Beginning in February Mexico also experienced a loss of gold and foreign exchange, chiefly because of a substantial increase of imports, together with a decline in remittances from Mexican workers in the United States. In June an increase in the domestic price of gold coin started speculation that the peso would be devalued, and a capital flight ensued. Mexico's large accumulations of reserves were more than adequate to meet the outflow, however, and it was not considered necessary to introduce exchange control. Gold coin continued to be sold to the public as an anti-inflationary measure, and it was believed that substantial amounts found their way to other countries where gold was at a higher premium for hoarding.

In November the Bank of Paraguay reduced the so-called "free-market" rates to the level of the official market (3.12 guaraníes per dollar) by eliminating the premium paid for certain categories of foreign exchange. The auction market was retained.

Exchange control in Peru, first introduced in Jan. 1945 following a capital flight, was strengthened in July 1946 by a decree requiring gold and bank deposits in foreign currencies to be sold to the Central bank in order to make available funds needed to pay for increased imports.

The Sterling Area.—The entire British empire (except Canada and Newfoundland), all British mandated territories, protectorates and protected states, Egypt, the Anglo-Egyptian Sudan, Iraq, Trans-Jordan, Iceland and the Faeroe Islands continued to make up the sterling area, as defined by the Defence (Finance) (Definition of the Sterling Area) order 1946, and by the Exchange Control bill introduced in Nov. 1946. All members of the sterling area, except Australia and New Zealand, were also members of the International Monetary fund, either in their own right or through the adherence of the countries to which they were bound.

Sterling balances held by members of the sterling area could generally be used for any payments within, but not outside, the area. Likewise, sterling balances belonging to certain countries outside the area could, by agreement with the United Kingdom, be used for payments anywhere within the area, but otherwise were blocked. Dollars and other hard currencies earned by members of the sterling area were pooled and re-allocated. This system, begun during World War II, was continued in 1946, but the first steps were taken toward making sterling receipts from current transactions of sterling area countries freely available for current transactions anywhere, and toward abolishing the so-called dollar pool. Under the terms of the Anglo-U.S. financial agreement, ratified in July, these conditions were to be established by July 1947.

An Anglo-Swiss monetary agreement, concluded in March, provided reciprocal credit arrangements which would in effect probably increase Swiss holdings of sterling by £15,000,000. In April a similar agreement

A CATHOLIC NUN CHANGING HER MONEY at a currency exchange in Shanghai, China, in 1946. Although the exchanges were really black markets, they were licensed by the municipal government to thwart illegal money changers

was signed with Portugal, permitting credits of £5,000,000 in either direction. Agreement was reached with Sweden in May, whereby Sweden would accept up to an additional £15,000,000-£16,000,000 in sterling balances through April 1947.

When the Anglo-Portuguese monetary agreement was signed, it was indicated that discussions had been held regarding disposition of the approximate £80,000,000 accumulated by Portugal during World War II, and that Portugal was willing to defer settlement for a considerable time, but there was no indication that a reduction had been agreed upon. A settlement with Argentina was signed in September, providing that out of Argentina's £131,000,000 in accumulated balances, £10,000,000 would be transferred to Brazil in settlement of an Argentine debt, £5,000,000 would be freed in each of the next 4 years for conversion into other currencies and the remainder might be drawn upon for repaying Argentine indebtedness to Britain or for buying out British investments in Argentina. The outstanding amount of accumulated sterling was to bear interest at the rate of $\frac{1}{2}\%$ per year. No provision was made, however, for scaling down the accumulated balances. All current earnings of sterling by Argentina were to be immediately free for conversion into any currency.

Although the organization of the dollar pool remained unchanged, its operation was somewhat relaxed. The dominions were freely allowed dollars, and those countries receiving a definite yearly ration (e.g., Egypt, Iraq and some of the colonies) in some cases received increased allocations. India, which had been the largest net contributor to the pool throughout World War II, became for the first time a net drawer on the pool.

Britain's gold and dollar holdings (gross) as of June 30 were reported to be \$2,200,000,000, as compared with \$2,400,000,000 at the end of June 1945. Approximately \$1,200,000,000 was drawn in 1946 against the Canadian and U.S. dollar lines of credit, which became effective in July and together totalled \$5,000,000,000.

In November an Exchange Control bill was introduced in the British parliament for the purpose of codifying the wartime exchange control regulations. It was stated that in order to ensure adequate control over capital movements and so prevent capital flight, it was necessary to supervise current transactions as well because they could be used to conceal capital movements. It was not intended, however, to perpetuate restrictions on current transactions, even though their supervision would be necessary. Current transactions were held not to include tourists' expenditures, and these were to be subjected to strict control. Capital movements within the sterling area would continue to be unimpeded, and it was recognized that the effectiveness of British exchange control would depend on the effectiveness of controls established by other members of the area.

Exchange rates remained stable throughout the sterling area. Market rumours in June that sterling would be devalued were abruptly followed, after the Canadian and Swedish revaluations in July, by rumours that sterling would be revalued, neither of which proved true. All initial par values approved by the fund for sterling area currencies were based on rates which had been in effect throughout the year.

Continental Europe.—European countries which were members of the International Monetary fund in 1946 included Norway, Denmark, Bel-

gium, Luxembourg, the Netherlands, France, Czechoslovakia, Poland, Yugoslavia and Greece.

In Poland and Yugoslavia foreign trading was in the hands of the government. Poland announced in April that an official exchange rate of 100 zlotys to the dollar had been established. Most of Poland's foreign trade was conducted on the basis of barter arrangements, however, and valuations were usually expressed in other currencies. The practical application of the rate was therefore limited chiefly to remittances and the expenditures in Poland of diplomatic delegations and visitors. It was generally acknowledged that this rate greatly overvalued the zloty, although the black market rate, which varied around 450 zlotys per dollar, undoubtedly gave too low a value to the currency. Likewise, the official Yugoslav rate of 50 dinar to the dollar, established in 1945, appeared to give an artificially high value to the dinar but had only limited practical significance.

In Greece the inflation was finally brought to an end in January after dollar and sterling credits were obtained by the Greek government. The market value of the gold sovereign, which circulated freely and was used by businessmen for calculating prices, had risen from 12,500 drachmas in June 1945 to 172,000 drachmas. After stabilization the gold sovereign dropped to 130,000 drachmas, which was close to the price quoted by the Bank of Greece. The official price for the dollar, set on Jan. 25, was 5,000 drachmas, 10 times the figure set in June 1945. At this rate of exchange gold had a value in Greece about three times the dollar price of gold.

Norway and Denmark were adversely affected by revaluation of the Swedish krona in July, not only because Sweden was an important source of imports to those countries, but also because they had accumulated substantial debts to Sweden. In Denmark the Swedish revaluation had the effect of putting an end, for a time at least, to pressure for devaluation of the Danish currency, although this question was revived later in the year when it became apparent that Denmark's difficulty in adjusting prices to the British market persisted. A tightening of exchange and trade controls, however, was considered preferable to devaluation.

All these countries except Czechoslovakia had large import surpluses but at the same time needed to encourage imports and to retain as much as possible of domestic production. Efforts were therefore made to limit imports of luxuries and exports of essentials.

The Near East and Africa.—Iran and Ethiopia were the only independent members of the fund in those regions which were not also included within the sterling area. The Ethiopian dollar, which was introduced in July 1945, had not gained complete acceptance throughout the country, and the old Maria Theresa dollar continued to circulate. In Iran sterling was freely exchanged at the official rate, but dollars could be bought only on the free market at a price considerably above the official value. The cost of dollars in the free market dropped, however, from 65 rials per dollar in Oct. 1945 to about 45 rials in Sept. 1946.

The Far East.—China abolished in March the long-irrelevant official exchange rate of 20 Chinese national dollars per U.S. dollar and declared a new official rate of CN \$2,020 per U.S. dollar, which fell within the range of unofficial quotations. At the same time, all foreign exchange transactions were made subject to licence. The new rate survived until Aug. 19, when it was replaced by a rate of CN \$3,350 to U.S. dollar. By the end of the year the unofficial price for U.S. dollar notes was CN \$6,500 per dollar although the official rate for dollar exchange remained stable. Separate currencies continued to circulate in the Communist areas, in Manchuria and in Formosa. Redemption of the currency (Central Reserve bank notes) issued in south central China by the former Japanese puppet regime was completed early in 1946, at the rate of CRB \$200 to CN \$1.

No change was made in the official value of the Philippine peso when the republic was established in July 1946. The Philippine government entered into an executive agreement with the United States providing that the value of the peso would not be changed, the convertibility of the peso would not be suspended and no restrictions would be imposed on the transfer of funds from the Philippines to the United States, except by agreement with the president of the United States. In September the Philippine government established its own foreign funds control office to perform the functions formerly carried out by the U.S. treasury department's foreign funds control office in the Philippines. General foreign exchange controls, however, did not exist.

In the Netherlands Indies the new Indonesian republic on Oct. 30 began the issue of its own currency, the rupiah, and on Dec. 1 declared its value to be 1.9 per U.S. dollar, which was approximately the rate for the Netherlands guilder before World War II.

Non-Member Countries.—**The U.S.S.R.**—Although the soviet union was eligible, prior to the end of 1946, to become a member of the International Monetary fund by signing the articles of agreement, it did not do so. The official value of the ruble remained at 5.30 rubles to the dollar, but actual transactions; e.g., the expenditures of diplomatic representatives, took place at rates which placed a lower value on the ruble. Foreign trade was generally conducted on the basis of barter with valuations made in terms of other currencies, principally the dollar.

The Former Neutrals.—Effective July 13 Sweden reduced its official selling price for the dollar from 4.20 to 3.60 kronor, or approximately 14%. This move was intended as an offset to the rise in prices of imports from the United States. Although to some extent the desired effect was achieved, a number of adverse repercussions were felt, as illustrated below in the discussion of its relations with Switzerland. Swedish losses of gold and foreign exchange throughout the second half of 1946 were substantial, and plans for the introduction of import controls early in 1947 were discussed. Swedish lending to other countries, including a credit of 1,000,000,000 kronor (\$278,000,000) granted to the soviet union effective Dec. 10, tended to increase upward pressure on prices in Sweden.

The Swiss franc, contrary to general expectations, was not revalued,

and the result of the changed relationship between these two important currencies was a heavy excess of imports from Switzerland to Sweden, for which Sweden tried to pay in gold. Swiss francs were generally in very great demand, however, and in August the Swiss National bank decided to limit the amounts of gold which it would accept from other countries in an effort to prevent the drain of goods from Switzerland. In October an agreement was reached providing that Switzerland would continue to accept certain limited amounts of gold from Sweden each month and that Sweden would share with the Swiss government the cost of issuing securities for the purpose of sterilizing the gold inflow. Switzerland's official gold holdings increased by \$70,000,000 during the first 9 months of the year, and there was probably also a substantial increase in the amount of gold held by the public.

Occasional reports of an impending devaluation of the Spanish peseta appeared throughout the year, and on Aug. 26 the Spanish government established preferential rates for tourists and for family remittances, but the rumours of a general change in the rate did not materialize. The Portuguese escudo was one of the currencies mentioned at the time of the Canadian and Swedish appreciations as likely also to be revalued, but the rate remained stable throughout the year.

The Defeated Countries.—The hyperinflation in Hungary far exceeded that which occurred in Germany after World War I. The official exchange rate for the pengő increased from about 6 per dollar on Dec. 1939 to 141,550 per dollar at the end of 1945, and to 1,835,000,000,000,000 per dollar on June 30, 1946. The unofficial rate on July 27, 1946, was 115.5 octillion (115,500,000,000,000,000,000,000,000,000) per dollar, probably the highest exchange ratio in the history of money. On July 31 the pengő was demonetized and replaced by a new currency unit called the forint. The official rate for the new currency was declared to be 11.74 forints to the dollar, and it remained unchanged through the rest of the year. At the time of the stabilization \$32,000,000 in gold was returned to Hungary by the U.S. armed forces in Germany, which served to give psychological support to the new currency.

In Rumania stabilization of the currency was not yet in sight at the end of 1946. The unofficial quotation for 1 U.S. dollar climbed from about 30,000 lei in January to 160,000 lei on Dec. 11. Negotiations were begun with Sweden in December for a credit of 50,000,000 kronor.

The official value of the Bulgarian lev, which had been quoted at 120 leva per dollar in Oct. 1945, was 286 leva per dollar in Nov. 1946, but had been at this figure for several months, and the finance minister declared that stabilization was impending.

In Germany Allied military marks continued to circulate in the four zones at par with the reichsmark, and the rate for military transactions remained at ten Allied military marks to the dollar, but beginning in September U.S. and British troops were paid in scrip which they were required to use in all dealings with military institutions, so that the military rate ceased largely to be applicable. For certain transactions; e.g., freight charges, special rates were established. Private remittances to Germany continued to be prohibited. Exports from the British and U.S. zones had to be paid for in dollars by the importing country. After economic fusion of these zones, effective Jan. 1, 1947, sterling also could be accepted, according to the directive of the Joint Export-Import agency. According to the merger agreement, signed Dec. 2, 1946, the exchange value of the German mark was to be established "as soon as this is practicable," and unofficial reports indicated that a rate of approximately 3.3 marks per dollar was under consideration.

Italy established in January a uniform premium of 125%, in effect bringing the official exchange rate (100 lire per dollar) to 225 lire per dollar. Beginning in March exporters were permitted to dispose of half their foreign exchange proceeds at free market rates on the condition that such foreign exchange be used in payment for specified imports within 90 days after acquisition. At the outset the free market rate was about 340 lire per dollar, but subsequently it rose to about 575 lire per dollar. Currency reform, previously rejected by the government, appeared to be scheduled for sometime early in 1947. The issuance of Allied military currency ceased in January, and military currency was gradually being withdrawn from circulation.

The Bank of Finland's official exchange rate of 136 Finnish marks per dollar, established in Oct. 1945, remained unchanged throughout 1946. A limited currency reform initiated on Jan. 1 required the temporary conversion of certain currency holdings into government bonds, but the net effect on total note circulation was not considerable.

For military transactions the Japanese currency continued to be valued at 15 yen per U.S. dollar, but commercial transactions and remittances were prohibited. Japanese exports generally required payment in dollars.

Other Non-Member Countries.—Argentina's system of multiple exchange rates was further complicated in November by the application of a special rate which in effect gave a subsidy to meat exporters. The whole structure included not less than 8 principal rates, ranging from 3.35 pesos per dollar (buying rate for regular exports) to 4.92 pesos per dollar (special selling rate for imports of luxuries). The demand for Argentine currency continued strong, the country's foreign exchange holdings increased considerably and there were frequent rumours of revaluation.

The currencies of Australia and New Zealand remained stable throughout the year. As members of the sterling area both countries participated in the dollar pool. Australia's sterling balances probably exceeded £165,000,000 by mid-1946, and New Zealand's holdings were reported to have reached £100,000,000 by November.

In Austria, an official exchange rate of ten schillings per dollar, corresponding to the former military rate, was established. An exchange equalization fund was set up to compensate for the disparity between the Austrian and the world market price level. On July 15, the Albanian government re-established the Albanian franc at an official rate of 2.77 francs per dollar. Re-establishment of the currency followed a drastic monetary reform which involved scaling down all money claims, prices

and wages to one-fifth their former value. In connection with an agreement for economic union between Yugoslavia and Albania, signed on Nov. 27, unofficial reports indicated that the two countries might adopt a common currency.

Turkey, on Sept. 7, devalued its currency in effect by 33%, although the new rate was about 53% below the old official rate which had only limited application. The new official buying rate was set at 2.80 pounds per dollar. (See also GOLD; INTERNATIONAL MONETARY FUND.)

Exchange Rates: see EXCHANGE CONTROL AND EXCHANGE RATES.

Exchange Stabilization Funds. During the 1930s a number of countries which did not adopt exchange control, notably the United States, Great Britain, France, Switzerland and the Netherlands, established exchange stabilization funds for the purpose of preventing undesirable fluctuations in exchange rates through active and large-scale purchases and sales of foreign exchange and gold. Stabilization funds were also nominally set up in certain exchange-control countries, such as Argentina, Spain, Latvia, Czechoslovakia and Colombia, but these funds were either inactive or operated only on a minor scale. With the virtual elimination of the remaining free-exchange markets early in World War II the basic rationale of the stabilization fund technique disappeared. Some funds were consequently wound up, but even those that continued in existence either were dormant or acted merely as agents holding part or all of the external monetary reserves of the countries concerned and passively carrying out special gold and foreign exchange transactions in an essentially controlled market.

This pattern remained basically unchanged during 1946 in view of continued widespread resort to exchange controls. Latin American stabilization funds, such as those of Argentina and Cuba, were believed to have taken no active part in external monetary transactions. Some activity was reported on behalf of the French and Dutch stabilization funds in the form of sales and purchases of gold and foreign exchange, but virtually nothing was known of these operations. The British Exchange Equalization account continued to hold the bulk of Britain's external monetary reserves and to dispose of these reserves abroad when needed to meet that country's deficit in its international balance of payments. The nature and extent of these operations were also shrouded in secrecy.

During 1946 the U.S. Stabilization fund continued to purchase and sell gold from and to foreign central banks and governments. Since the fund's active working balance was only about \$250,000,000 it could be presumed that the fund, as before 1946, sold gold to the treasury whenever necessary to acquire dollars for purposes of gold purchases from foreign authorities, and, conversely, sold dollars to the treasury whenever necessary to acquire gold for sale to foreign authorities. The fund's published balance sheets, available for Dec. 31, 1945, and June 30, 1946, indicated that between these two dates its gold holdings rose from \$18,000,000 to \$71,000,000, while its dollar holdings fell from \$230,000,000 to \$194,000,000. The fund also held in its inactive account on June 30, 1946, \$1,800,000,000 of gold, which was pledged as part payment for the U.S. subscription to the International Monetary fund.

Commencing in 1937 the U.S. treasury had entered into a series of special agreements with various foreign countries whereby the fund contracted to purchase their respective currencies and/or to sell gold to these countries, up to specified amounts. Only three of these agreements—those with Brazil, Mexico and Cuba—were known to have been still in existence

in 1946. According to the agreement with Brazil of July 1937 (later revised) the fund agreed to purchase up to \$100,000,000 of cruzeros and to sell that country up to \$300,000,000 of gold. It was not known, however, if any recourse to that agreement was made in 1946. It was also not known if the fund purchased during 1946 any of the \$40,000,000 of pesos up to which it had contracted to buy from Mexico according to an agreement of Nov. 1941. The fund's balance sheets indicated, however, that the sum of \$5,000,000 owing on Dec. 31, 1945, to the fund from the government of Cuba as a result of gold sales to that country under an agreement of July 1942 was liquidated during the first half of 1946. During the same period, moreover, the fund's aggregate holdings of foreign exchange declined from \$4,900,000 to \$3,900,000. (See also EXCHANGE CONTROL AND EXCHANGE RATES; GOLD.) (A. I. B.)

Expenditure, Government: see BUDGET, NATIONAL.

Exploration and Discovery. With the formation of the Arctic Institute of North America representing both the United States and Canada, a program of most urgently desirable polar research was developed and was in progress during 1946.

Among the more noteworthy activities in the arctic were several large-scale naval, military and air exercises. Detailed reports might eventually be made available to explorers and scientists. But apart from their military aspects these exercises showed that even with the aid of the most recent technical equipment, success of any venture into the arctic depended on the resourcefulness of the individual. Initiative, endurance and adaptability, which were required for the methods of an earlier age, had not yet been outmoded by the push button or the automatic pilot.

Patrol Vessel "St. Roch."—The patrol vessel "St. Roch," 80 tons, 12½ feet draught, 300 h.p. auxiliary schooner, under Sgt. (later Inspector) H. A. Larsen, in 1940-42 made the first successful Northwest passage in an easterly direction by re-tracing Roald Amundsen's passage in reverse. In the summer of 1944 Inspector Larsen again brought the "St. Roch" through the Northwest passage, returning the ship from Halifax to Vancouver, a stirring event in the arctic, for it was not only the first passage made in a single season but it was also by a new and probably better route via Barrow strait and Melville sound.

"Aries" Flight.—On May 17, 1945, the R.A.F. Lancaster plane "Aries," under Wing Commander D. C. McKinley, flew from Reykjavik, Iceland, to the north pole, circled it (outside temperature, -30° C.) and returned. Two days later, the plane flew over the charted position of the north magnetic pole in Boothia peninsula and continued north for 200 mi. to a point where the dip compass registered 89½°, but balanced compasses continued to point north-northwest.

On May 25, while in lat. 74° N., long. 110° W., on its nonstop flight from White Horse, Yukon, to Shawsbury, England, the plane's compasses registered a dip of more than 89° but pointed south.

"Pacusan Dreamboat" Flight.—On its nonstop flight from Honolulu, Hawaii, to Cairo, Egypt, Oct. 4-6, the U.S. Superfortress B-29 plane "Pacusan Dreamboat" under Col. C. S. Irvine, crossed the Boothia peninsula supposedly about 100 mi. north of the north magnetic pole. Here the plane's magnetic compasses still pointed north and calculations at the time placed the magnetic pole some 200 mi. north of its usual charted position.

Exercise "Musk Ox."—A joint U.S.-Canadian army test of ground transportation and equipment left Churchill, Man., Feb. 15 under Lt. Col.

RUSSIAN GEOLOGICAL EXPEDITION in the Pamir mountains in Central Asia during early 1946. Exploration was for possible deposits of minerals and oils in that region

P. D. Baird to study performance of snowmobiles, caterpillar tractors and other heavy transportation equipment, suitability of various foods and clothing and feasibility of air supply of ground forces under arctic conditions. Representatives from Belgium, Chile, France, Norway, Peru, Russia and the United Kingdom accompanied the exercise. Setting out in a temperature of -43° F. the trek proceeded 900 mi. north to Cambridge bay on Victoria Island, thence 900 mi. west via Coppermine to Ft. Norman on the Mackenzie river over territory never before traversed by mechanical means and largely unmapped. Supplies were dropped en route by parachute and by glider freight planes of the U.S. and Royal Canadian air forces.

Leaving Ft. Norman April 16, the trek proceeded 1,200 mi. south to its destination, Edmonton, where it arrived May 6. During the final few weeks, travel had to be made by night to avoid difficult thawing conditions when the daytime temperatures rose to 54° F.

Participants in the exercise were found to have fitness scores equivalent to those of Harvard athletes, according to the Harvard Fatigue Laboratories whose representative made physical fitness tests before and after the exercise.

Operation "Frost Bite."—The 45,000-ton U.S. naval aircraft carrier "Midway" under Rear Adm. J. H. Cassady, accompanied by 3 destroyers, left Hampton Roads, Va., on March 1 for 4 weeks of manoeuvres in Davis strait between northern Labrador and southwest Greenland to test clothing, personnel and techniques of carrier operation in icing conditions. Radar and loran (radio-beam shore stations) were found highly effective in avoiding icebergs and in determining position in periods of low visibility.

Operation "Nanook."—During the months of July, Aug. and Sept., the U.S. coast guard cutter "Northwind" under Capt. (later Rear Admiral) R. H. Cruzen, accompanied by five other naval vessels, conducted manoeuvres in ice pack navigation in Baffin bay, Kane basin and Lancaster sound. The cutter "Northwind," a highly modernized icebreaker, reached Lat. 81°44' N. off Ft. Conger on Aug. 24, and on Sept. 2 had all but passed through the Northwest passage in McClure strait at 114° W. longitude, both passages being records for steel hull ships.

Operation "Iceberg."—A flotilla of five U.S. submarines under Rear Adm. R. R. McCann left Honolulu Aug. 22 for Bering straits and the Arctic ocean for tests in sea water layers of various temperatures. At lat. 70°21' N. a solid wall of pack ice was reported as blocking more northerly manoeuvres.

Soviet Arctic Activities.—Late in 1945, the N-331, piloted by M. A. Titlov of the Northern Sea Route administration, made several flights covering 20,000 km. in wide sweeps over the Arctic ocean, using Cape Chelyuskin as a base. The north pole was reached, but the chief objective was reconnaissance of ice conditions in the Laptev and Kara seas.

In March and April 1946, using the N-368, Titlov made eight flights

over Barents sea and the region north of Fridtjof Nansen Land, reaching lat. 85° N. Another plane, piloted by I. S. Kotov, investigated ice conditions in the East Siberian and Chukotsk seas.

In March 1946 the Arctic institute of Leningrad announced plans for the use of drifting automatic radio-meteorological stations to be set up or dropped at definite points in the arctic in such a way that approximately two years after their establishment the entire central arctic would be covered by a network of such stations. Meanwhile, a geophysical and oceanographic survey of unexplored sectors of the arctic was announced by Prof. Vladimir Vize of the Soviet Academy of Sciences, together with a five-year plan of hydrographic work to set up new lighthouses, radio beacons and radar stations. Ultimate objective was stated to be the conversion of the open sea polar route into a smoothly functioning shipping lane.

In Aug. 1946 it was announced from Moscow that Titlov had made the first map of the arctic ice pack, a chart of great value to spring navigation across the northern sea route between Archangel and Vladivostok. The Arctic institute was training personnel to co-ordinate the meteorological observations received from automatic radio weather stations, newly set up both on arctic islands and on drifting floe ice, and to prepare series of ice maps for the various passages along the northern Siberian coast.

In Oct. 1946 Prof. Igor Maksimov of the Arctic institute left Vladivostok on the soviet icebreaker "North Pole" for an attempt to push through for the first time from east to west along the northern sea route.

In Dec. 1946 it was announced from Moscow that large-scale restoration of the Spitsbergen coal mining facilities, belonging to Russia, was soon to begin. Groups of coal mining constructors and prospectors left Leningrad for Spitsbergen while another expedition to Spitsbergen was scheduled to leave Murmansk soon afterward with 16,000 tons of equipment and food for miners.

The Soviet Academy of Sciences continued an intensive investigation of the apparent gradual elevation of arctic temperatures and the corresponding increase in agricultural potentialities of permafrost areas. Extensive new areas of frost-resistant cereals and vegetables were reported, the record for northernmost crops being held by the Dolgan tribe who had successful vegetable crops during July at lat. 71° N. Archaeological evidence of the apparent northerly shrinking of the zone of permanently frozen soils came from the discovery in the spring of 1946 of a "well-stocked cemetery" of perfectly preserved mammoths along the Zyryanka river in the Magadan district of eastern Siberia. Siberia continued, however, to have cold winters, for it was reported that a new "cold pole" was found in a previously unexplored mountain section near Oimekon, Siberia, (lat. 63° N., long. 143° E.) where the temperature falls to -94.4° F.

Activities in the Antarctic.—From 1943 a British group apparently occupied a base at Marguerite bay in the Palmer peninsula that had been set up in 1940-41 by the U.S. antarctic service as its east base under Commander Finn Ronne. The British considered this region part of the Falkland Islands dependencies, and made numerous surveys there. Visits to the same spot were also made during World War II years by representatives of Argentina and of Chile, each of these latter nations claiming sovereign rights over this area. All three claims overlapped. The United States made no official claim for this region nor for any other part of the antarctic continent; nor did it recognize the territorial claims of any other nation for any part of the antarctic.

During Nov. 1946 12 British scientists led by P. L. Elliott left England in the nonmagnetic ship "Trepassy" for a two and a half years' stay in the Falkland Islands dependencies making geologic and meteorologic investigations in South Georgia, Grahamland, the South Shetland Islands and the South Orkneys.

Later in December, the Argentine naval transport, "Patagonia," was reported leaving for the antarctic to set up weather stations in Argentine territory.

At the same time, Moscow reports stated that the soviet explorer, Ivan Voronin, had left northern Russia with a ten-ship whaling flotilla for the antarctic; while reports from Johannesburg, South Africa, listed 14 separate whaling expeditions, mainly Norwegian and British, ready to enter antarctic waters.

Ronne Antarctic Research Expedition.—In Nov. 1946 the American Antarctic association announced that Commander Finn Ronne would lead a 20-man scientific expedition to the antarctic using his old base at Marguerite bay in the Palmer peninsula. The ship, "City of Beaumont, Texas," a diesel-powered wooden navy ATA-215 was specially chartered for the expedition by act of congress, and carried 3 specially designed army air force planes and 3 army "weasels" or snow tractors. Commander Ronne expected to freeze his ship in over the antarctic winter and would seek primarily to compile data on the performance of electronic equipment, climatologic reactions on the personnel, meteorologic and glaciologic conditions, and would make extensive ground and air surveys. The expedition included several antarctic veterans, among them Schlossbach, Gutenko and Darlington, and expected to return in June 1948.

Operation "High Jump."—On Dec. 2, the U.S.S. "Mt. Olympus," flagship of a fleet of 13 naval vessels comprising task force 68 under Rear Adm. R. H. Cruzen, left Norfolk, Va., for the antarctic with orders to examine the limits and character of the ice belt surrounding the antarctic continent, to explore the largest practicable area of the coast line and continent and to amplify scientific knowledge of the region, especially in hydrographic, geographic, geologic, meteorologic and electromagnetic fields.

The officer in charge of the project was Rear Adm. R. E. Byrd, tactical command being held by Rear Adm. Cruzen. The expedition included 4,000 men, naval vessels ranging from the submarine "Sennet" to the Essex class carrier "Philippine Sea," and aircraft from helicopters to the Lockheed Neptune plane which made the long distance record from Perth, Australia, to Columbus, O., in Sept. 1946.

The expedition fleet upon reaching antarctic waters proceeded to operate in three divisions: a central group off the Ross sea, a western group off Victoria Land and an eastern group off Ellsworth Land and Amundsen sea.

On Dec. 30 a Martin-Mariner plane on a photo-scouting mission over Ellsworth Land grazed an ice peak and exploded in mid-air, killing three of its crew of nine. The 6 survivors were rescued 12 days later by a sister plane from the eastern group.

The expedition, still beset by abnormally difficult ice pack conditions, planned to leave antarctic waters by March 1947. (D. Cn.; P. A. Se.)

Explosions: see DISASTERS.

Export Controls: see LEND-LEASE.

Export-Import Bank of Washington. Created in 1934, the bank was made a permanent, independent agency of the U.S. government by the Export-Import Bank act of 1945, approved July 31, 1945. The purpose of the bank was to aid in the financing and facilitating of exports and imports and the exchange of commodities between the United States and foreign countries. All of the operations of the bank were related to this fundamental purpose.

The act of 1945 vested the management of the bank in a board of directors consisting of the secretary of state and four full-time directors appointed by the president of the United States by and with the advice and consent of the senate. It also authorized an increase in the limit on outstanding loans and guaranties from \$700,000,000 to \$3,500,000,000 and removed the prohibition on loans by the bank to governments in default on their obligations to the U.S. government.

In addition to its reconstruction loans, the bank continued to finance foreign trade of the United States in two other principal ways. It financed specific export and import transactions on application of U.S. exporters and importers where the nature of the risk involved was such that private credit could not be obtained. It also made long-term loans to assist in financing the export of U.S. materials and equipment required for development projects in foreign countries.

The total amount of loans authorized by the bank from the time of its establishment in 1934 increased from approximately \$2,300,000,000 at the end of 1945 to \$3,500,000,000 at the end of 1946. Disbursements during 1945 were approximately \$1,030,000,000 and repayments were approximately \$40,000,000. As a consequence the outstanding loans of the bank increased from \$252,000,000 at the end of 1945 to \$1,242,000,000 at the end of 1946. (A. My.)

Exports: see AGRICULTURE; INTERNATIONAL TRADE; TARIFFS. See also under various countries.

Eye, Diseases of. **Nutritional Retrobulbar Neuritis.**—Numerous cases of retrobulbar neuritis were observed among British military personnel repatriated from the prison camps of Burma, Singapore, Thailand, China and the Philippine Islands. Central, cecentral and paracentral scotomas were the most common visual field findings. Pallor of the optic discs proportionate in degree to the duration and severity of the visual loss was noted. Polished rice was the principal item in the diet of these people. Some amount of recovery of vision was obtained with a high vitamin intake in those individuals in which the disease was not of long duration. In most instances the disease was believed to be the result of a nutritional disorder closely allied to beriberi, but the availability of methyl alcohol and strong tobaccos of native origin in some camps brought up the possibility of a toxic aetiology.

Plastic Socket Implants.—Several types of implants were devised during 1946 for use in sockets following enucleation. All of the implants were made from so-called plastics. It was

the object of all methods to provide a more movable and better appearing prosthesis. A. D. Ruedemann devised a plastic globe and anchored the implant to the rectus tendons by means of tantalum wire and tantalum paddles. Cutler implanted a lucite basket to which could be fitted a prosthesis with a projecting stud. This work opened up a new field in the use of plastics in the orbit.

Low Reflection Treatment of Ophthalmic Glass.—During World War II a method was discovered for reducing the reflected light from glass used in military instruments. In 1946 this method was applied to spectacles so that "ghost" images resulting from reflection were reduced. This was accomplished by evaporating magnesium fluoride from an electrically heated tungsten filament and condensing it on the surface of the glass. This film of magnesium fluoride was believed to be so adherent and so hard as to be unaffected by the ordinary methods used to clean spectacle lenses.

Eye Findings Observed Among Atom Bomb Casualties.—Although approximately 16 months had elapsed after the first atom bomb explosion in Japan, reports by medical investigators were sparse. K. B. Benkwith reported a case in which retinal haemorrhages were observed. Massive preretinal haemorrhages and haemorrhages into the nerve fibre layer of the retina were present in both eyes. The haemorrhages were located about the optic discs. Small, fluffy, white exudates were also scattered about the optic discs. In approximately five months' time the haemorrhages and exudates had absorbed so that very little evidence remained of the previous pathologic changes. The resolution of the eye findings coincided with the improvement in the patient's general health.

Diisopropyl Fluorophosphate (D.F.P.).—A promising new drug was reported in the treatment of glaucoma. Diisopropyl fluorophosphate seemed to be a more powerful antiglaucoma drug than miotics such as pilocarpine and physostigmine. Its effects were shown to be entirely because of the inactivation of cholinesterase and not to direct action on the iris and ciliary muscle. Since the drug was unstable in aqueous solution, peanut oil was used as the vehicle. For use in the eye 0.1% or 0.05% D.F.P. in peanut oil was recommended. No disagreeable systemic effects were noted, but spasm of accommodation sometimes occurred following the use of the drug in the eye. The effect of the drug was very prolonged, enabling patients to control the intra-ocular tension by instillation of the drug once daily and in some individuals by instillation once a week.

Famines. Food scarcity was widespread in several areas in the world in 1946 including Europe, Japan, China and India. However, shortages because of crop failure to the extent of causing deaths from starvation were confined to a few areas. The vigorous efforts of all agricultural and relief agencies to increase food production as well as commerce in food supplies greatly improved conditions in European and Japanese

HUNGRY AND EMACIATED CHINESE FARMERS of Hunan province waiting for their ration of soft rice from the U.N.R.R.A. in 1946

war-damaged areas. The overpopulated districts of China and India, however, were on such a narrow margin of supplies that a slight crop decline reduced food supplies to starvation levels.

World food production as a whole in 1946 was estimated to be about 7% above the level of 1945 and above the prewar average. No widespread crop disasters such as drought, flood, etc., occurred during the year. Efforts to prevent famine were conducted on a greater scale than ever before. The United Nations Relief and Rehabilitation administration (U.N.R.R.A.) was in full operation, occupation armies were assisting the people of former enemy countries and emergency committees were giving attention to needs promptly as they arose.

The Hunan area in China, which suffered severely in 1945, continued in critical condition through 1946. Considerable supplies were moved in by U.N.R.R.A. and other agencies. An embargo on shipments to China was imposed in July because of the clogged condition of the ports which reduced the aid to this region. Local military operations also interfered with the distribution of supplies. Estimates of the number of deaths from food shortage varied widely. A survey by an agent of U.N.R.R.A. reported in July that 6,000,000 people in Kwangsi province and 10,000,000 in south Hunan were so weakened that thousands more than the usual death rate were dying. Crops in these provinces were only 25%-50% of normal which is disastrous, since full production is barely enough to maintain subsistence of the population. The cause of the crop shortage was the continued scarcities of water buffalo to work the land, seed, irrigation facilities and widespread malaria and other diseases among the people on the land.

In India the Bengal area, which experienced a severe famine in 1943, was again on the margin of subsistence. The movement of supplies from other areas, however, prevented large loss of life. Food production in India as a whole was estimated at about 10% above the prewar average.

A plague of locusts invaded Sardinia and some other Mediterranean areas early in the year. Supplies of poisons were sent by air to Italy and a vigorous campaign was waged for 130 days with successful results. The damage was restricted and the pests controlled. A smaller outbreak occurred in Albania. The gigantic Yellow river dike project to control the floods was expected to increase greatly food production in that area of China.

Plans by the United Nations for world-wide famine relief following the termination of U.N.R.R.A. activities in 1947 were

being discussed at the end of 1946 but no agreement was reached. The proposal of a World Food board was not accepted by the United Nations Food and Agriculture organization. The president's National Famine Emergency committee set up early in the year worked particularly to stimulate shipments of grain and other foodstuffs to ports and overseas. Former Pres. Herbert Hoover made a survey of the food situation in Europe and other areas and reported that mass starvation could be averted if U.S. exports were maintained. The Combined Food board was reorganized into the International Emergency Food council to direct international shipments to areas of greatest need. (J. C. Ms.)

Far Eastern Commission: *see* JAPAN.

Farm Co-operatives: *see* FARM CREDIT ADMINISTRATION.

Farm Credit: *see* FARM CREDIT ADMINISTRATION.

Farm Credit Administration. Farmers in the United States and their business co-operatives obtained loans totalling \$1,278,666,250 in 1946 from the institutions and associations operating under the supervision of the Farm Credit administration, compared with \$1,077,560,338 in 1945. These loans were used to finance farm and ranch operations, to improve and purchase farm land and to finance farm co-operatives through which farmers market their products and obtain farm supplies and farm business services.

Short-term or production credit went to farmers through their 500-odd co-operative production credit associations operating in all agricultural counties of the United States. Loans made to farmer-members in the year totalled \$614,612,987, compared with \$516,115,670 in 1945. The 1946 volume was the highest in any year after the production credit associations were organized in 1933 and 1934. Membership of 394,882 on December 31, 1946, compared with 372,043 at the end of 1945. This big increase in credit extended was largely the result of increased costs of supplies—seed, feed, material used in repairs and other items needed in farm operations.

Long-term or farm mortgage credit was obtained through about 1,600 national farm loan associations operated co-operatively by farmers. Farm mortgage loans amounting to \$145,196,566 were closed in the year. This total included 29,103 federal land bank loans for \$130,161,766. Land bank loans, except for the emergency period in 1933–35, reached the highest annual volume after 1927. Demand for loans to purchase farm land decreased with 38.8% of applications for land bank and commissioner loans received in the year requesting funds for this purpose, compared with 42.4% in 1945.

Pay-offs on land bank and commissioner loans made in previous years continued high with 119,390 borrowers repaying \$288,012,962 to complete payments on their loans. As a result, the amount of loans outstanding declined slightly despite the large volume of new loans closed.

Farmers' co-operatives, marketing, purchasing and business service associations obtained \$458,151,362 from the 13 banks for co-operatives, including advances under the Commodity Credit corporation, in the year compared with \$361,255,041 in 1945. Loans for operating capital funds and for buildings and equipment increased substantially over the two previous years. Demand for financing commodities in storage declined, caused largely by the rapid movement of staple commodities into consumption.

The 12 federal intermediate credit banks made loans and discounts totalling \$1,022,486,724 in 1946, for about 600 institutions making loans to farmers and stockmen and their co-operative associations. These banks were the principal source of production credit association loan funds.

The Farm Credit system made notable progress in 1946 in

repaying government-owned capital. The 12 federal land banks repaid \$91,238,570, the production credit corporations \$7,950,000, and the Federal Farm Mortgage corporation \$25,000,000. Government-owned capital in the system declined 37.8% in the year.

At the end of 1946, borrowers, farmers and farmers' co-operatives, had a net investment in capital stock in production credit associations, national farm loan associations, federal land banks and banks for co-operatives of \$108,464,793. (I. W. D.)

Farmers Home Administration. This new agency of the United States department of agriculture began operation Nov. 1, 1946. Established under authority of the Farmers Home Administration act of 1946, approved Aug. 14, it took over the work of two former agencies—the Farm Security administration and the emergency crop and feed loan division of the Farm Credit administration. Farmers who cannot obtain the credit they need from regular lending sources in their communities are eligible for loans. Borrowers receive, as needed, individual guidance in farm and home management.

The legislation gave permanent authorization for the type of short-term operating credit offered by FSA which congress had previously authorized on a year-to-year basis, and expanded the scope of the Bankhead-Jones Farm Tenant program to include 40-year loans for farm enlargement and improvement as well as for farm purchase. Interest on real estate loans was raised from 3% to 3½%. Mortgage insurance for private loans for farm purchase, enlargement and improvement was authorized for the first time, although funds for this purpose were not appropriated. War veterans were given preference in obtaining real estate loans and mortgage insurance.

Accounts of farmers using Farm Security or crop and feed loans were transferred to the new agency, and county offices continued their work without interruption. The demand for loans from war veterans and others continued heavy.

The year was marked by greatly increased lending activity. Early in 1946 congress provided additional funds to meet the demand from World War II veterans for farm operating loans, and by Oct. 31 FSA had advanced \$55,158,000 to 40,605 new borrowers in contrast with advances of \$24,679,000 to 22,119 new borrowers in the same period of 1945. Supplemental operating loans made to borrowers already using FSA credit amounted to \$42,576,000 or 15% more than in 1945.

In the farm ownership program FSA made 3,808 loans of \$29,429,000 in the ten months, compared with 1,110 loans of \$7,841,000 for the same months of 1945. Loan advances in the western states for water facilities were 54% higher than in the previous year.

A survey of Farm Security assistance to World War II veterans on Oct. 31 showed that in the last few years 23,570 former servicemen borrowed \$41,488,107 for farm operating needs, while 3,071 borrowed \$24,159,288 to buy farms.

Demand for crop and feed loans also rose in 1946. Through October, the emergency crop and feed loan offices advanced \$16,139,975 compared with \$15,526,925 in the first ten months of 1945. (D. B. L.)

Farouk I (1920–), king of Egypt, was born at Cairo, Feb. 11, the only son of King Fuad I. The failing health of his father forced him to interrupt his studies in England and to return to Egypt. On the death of Fuad I, April 28, 1936, Farouk became king under a regency. On July 29, 1937, the regency was dissolved and Farouk formally assumed his duties as king of Egypt. On Jan. 20, 1938, he married Farida Zulfikar, granddaughter of an eminent Egyptian statesman.

At the outbreak of World War II Egypt severed diplomatic relations with Germany and later Italy, but Farouk said his country would not enter the war except in the case of attack. It was later declared that the king's support of the Allies was only tepid at best and a postwar report, unconfirmed, said he had only agreed in early 1942 to appoint a pro-Allied premier when faced with a British ultimatum that he either do so or abdicate. In Feb. 1945 Farouk and other Arab leaders conferred with Pres. Roosevelt after the Yalta conference.

After the war Farouk, in an important statement of policy (Nov. 12, 1945), called for close relations between Egypt and Great Britain on a basis of "real equality"; he also asked for complete withdrawal of British troops and influence from Egypt. He conferred with Ibn Sa'ud in Cairo and on Jan. 16, 1946, the two monarchs issued a joint communiqué declaring that Palestine must remain an Arab country. The following June he gave sanctuary to Haj Amin el Hussein, grand mufti of Jerusalem, who had escaped from France.

Fascism. The total defeat in 1945 of Germany, Italy and Japan, the three countries which had formed the core of international fascism, caused a world-wide decline in the fortunes of fascism in 1946. The movement which had represented a distinct threat to world peace and to the liberties of mankind in the preceding decade had ceased to be a factor of major international importance. Under U.S. leadership the process of democratization made remarkable progress in Japan. In Germany much of the fascist or national socialist mentality remained but did not show itself openly in the elections in which only the democratic parties and the communists were allowed to participate. In Italy, however, a party resuming many of the fascist traditions and slogans gained a large number of adherents in the elections. It called itself *Il fronte del' Uomo qualunque* (The Front of the Common Man) and was led by Guglielmo Giannini.

In Great Britain the British fascists under Sir Oswald Mosley were revived without however gaining any importance. Hardly more important were the various minor fascist groups in the United States. One of them called Columbians with its centre in Georgia under the leadership of Homer Loomis Jr. and Emery Burke imitated all the details and paraphernalia of the German national socialists. In Dec. 1946 the government instituted proceedings against them as a subversive group.

Only in the Iberian peninsula and in Argentina were fascist or semi-fascist governments in power in 1946. The government of Generalissimo Francisco Franco in Spain was throughout the year the target of repeated condemnations by the United Nations organization. Its assembly passed in Dec. 1946 a resolution calling upon the Spanish people to remove the fascist government and to introduce a democratic regime. The resolution threatened Spain with a break of diplomatic relations should the fascist regime not come to an end there within a reasonable time and as a first step asked for the recall of all ambassadors and ministers accredited in Madrid. In Portugal Premier Antonio de Oliveira Salazar made a speech on Nov. 9 which was published on the front pages of all of Portugal's newspapers. In that address he denounced democracy as a failure while praising the soviet union's achievements in war and peace.

In Argentina Juan D. Perón was elected president of the republic in the elections of Feb. 1946. He was supported by the Argentine Labour party. He succeeded in winning the approval of the Argentinian masses by his socialist measures, his attacks on capitalism and plutocracy, and his order for a compulsory rise of roughly 30% in wages. On Oct. 21 President Perón opened the special session of the Argentine congress by reading a message which outlined his five-year plan for the industrialization of the country. The plan included an intensification of the official control over the nation's economy, complete reorganization of its transportation system, the introduction of large-scale irrigation and colonization schemes and an intensive technical education program. The plan also foresaw the introduction of woman suffrage. Argentina was to run its own air lines to Washington, Paris, Madrid and Rome. On Nov. 29 the Argentinian chamber of deputies passed a measure which made all Argentine men and women from 10 to 50 years of age liable to military training and military service.

Though all these measures of military training, socialization and industrialization recalled the methods of totalitarian governments, President Perón insisted that his government, formed as a result of the cleanest elections Argentina ever had, was not a dictatorship. The government officially declared that it would not interfere with the liberty of the press. The next day *Prensa*, the leading Argentinian newspaper, charged that judicial appointment and tenure were subject to political whims and interests and declared that the existing condition of the government encroaching on the liberties of the people was intolerable.

Perón's five-year plan establishes the close supervision of the government over the whole judiciary and educational system of the country, the freeing of the press from "capitalist" influence and the gradual abolition of the wage system for an economy which will give the workers their full share in all industrial, commercial and agricultural enterprises. To strengthen its military and economic power, Argentina hoped for a closer union with Chile, Bolivia, Paraguay and Uruguay. Means of economic pressure were used with that aim in mind. Argentina, a country with great food resources, is especially anxious to gain control of the mineral wealth of Chile and Bolivia and of the Pacific ports of Chile. On Dec. 13 a pact providing for a customs union and all-out economic collaboration between Argentina and Chile was signed in Buenos Aires. It was to be an exclusive pact barring all other nations, even those having most-favoured-nation treaties, from the special privileges granted in the pact which implies the closest political ties between the two countries. It permits the free use of the ports of each nation by the other, and assures to Argentina the minerals required for the five-year plan. Chile obliges itself to buy all machines, materials and implements from Argentina except if the latter country declares its inability to provide them. (See also ANTI-SEMITISM; ARGENTINA; COMMUNISM; DEMOCRACY; GERMANY; ITALY; JAPAN; RUMANIA; SPAIN.)

FILMS.—*Despotism* (Encyclopædia Britannica Films Inc.). (H. Ko.)

Fashion and Dress. The trend toward femininity, which became marked late in 1945, came into its fullest expression during 1946. After the long years spent in suits, women turned back to dresses again, and wore them shaped to their natural (or slightly idealized) figures, rather than heavily padded into curves, as had been the fashion in 1945. Day dresses were often in pastel colours, with demure Peter Pan collars, full gathered skirts, and sometimes ruffles or smocking. Sashes began to take the place of the brass-encrusted leather belts women had loved with their more tailored clothes. The wide-necked dress, extending low across the shoulders on either side, was a great favourite, for dinner

clothes and play clothes alike, especially for the young. Over these soft dresses the skirt-covering coat—the fitted full-length redingote—came back, after a long absence, as the most important coat fashion.

The ultimate in femininity was the emergence of the shoulders and bosom at the Spring Paris collections of evening clothes. Shoulders, backs and often a handsome part of the bosom were exposed, though always in a gentle, never a flamboyant, way. These dresses were willowy, poetic, trailing yards of cloth in the skirts. In a time when Paris was short of cloth, short of fuel, short of everything except talent, these bare-topped extravagances seem paradoxical. Yet it was all very reasonable—a logical facing of the fact that Paris was fighting for its position as an authority on style, and it put everything it had into building its great export—fashion.

Shades of 1913 turned up in the Paris collections and quickly became part of the Look of the Year. One of the most important of these was the uneven hemline. Mid-calf skirts for afternoon, and long skirts for evening began to dip in back, sway to one side, or fall into jagged petals all around, giving the ankles and feet more importance and allure than they had had in years. These uneven hemlines were only one expression of the asymmetrical lines which became popular in the year. Play suits, dinner and evening dresses appeared wearing one shoulder strap only. Swim suits had jersey tops pulled low over one hip, high over the other. Undoubtedly the fact that the asymmetrical line plays up the best in the feminine figure, and camouflages its faults, had a great deal to do with the popularity of this trend.

Another derivation from the 1913 silhouette was the cutaway suit, the jacket hem slanting backward, often softly flared, like a dipped peplum. Another very popular suit was the "bell-hop" suit, with a very short neat jacket, buttoned tight and fitted like wallpaper. While not overly feminine, this had a completely different look from the man-tailored suit, and was the counterpart of the redingote coat—giving a meticulous neatness to the figure, and emphasizing the natural waistline.

Play clothes took on ruffles. Instead of shorts, there were little round baby pants, the legs like puffed sleeves. The Kiltie, a short pleated skirt, was an extremely important fashion for play wear, both in a very short version, and a longer one just above the knees.

It was a year in which beautiful fabrics came back. England exported wonderful tweeds. Fine Irish linens returned, and were used very simply for little day dresses, and very lavishly, embroidered with lace, for evening wear. In the Fall collections, Paris made an extraordinary show of luxury fabrics—extraordinary both because of their great scarcity, and the spend-thrift way they were sewn—yard on yard of the precious goods made into a single skirt. "Court" fabrics, embossed velvets, rich brocades, heavy sombre satins, were used for even the young evening clothes. Embroidery was rampant—every kind of encrustation—*passementerie*, jet beading, lace appliques, silk tassels, ball fringe, worked in great magnificence. Colours were 18th century in their delicacy, pale and sweet, sentimental as *mignonette*—faded pink, white, ice blue, yellow, mauve, dark violet.

It was inevitable with all the love of furbelow that fine feathers should have been the fashion in 1946. Hats were trimmed with all the most flirtatious feathers, with precious old plumes like egret, and sometimes with little birds, or vulture feathers made to look incredibly airy and un-vulturish. Untrimmed hats were definite in shape, and intricate in their draping. The tricorne, the bicorne, the tiny pillbox were popular shapes.

The fall evening collections in Paris were more modest, gently alluring. *Décolletages* were cut less low, and shoulders were

often covered. The ankle-length evening dress came into greater importance than the great picture-skirted ball gowns. Over these shapely, slender dresses were shown the very smallest and the very biggest wraps. Shoulders were often covered by tiny boleros, sometimes extending just to the bustline. Voluminous capes went over day dresses and evening gowns alike, and often the capes wore loosely draped hoods of pastel wool. One of the most dramatic wraps of the year was a greatcoat cut like a cape, and lined with seal.

The changing skirt lines, the return of precious nylon stockings, the general mood of feminine allure all affected the appearance of shoes. They were designed for grace again, for a beautiful show of ankles, and the curve of arch on a slender high heel. Men welcomed them, after so many years of sensible down-to-earth shoes for women. Ankle straps grew more popular than ever for afternoon wear. The cut-out toe and heel were on the wane. Instead many of the prettiest shoes had little peek-a-boo cut-outs above the toes, showing the part of the foot where the toes begin instead of where they end. Even the low and medium-heeled shoes had an appearance of delicacy which looked new.

The lifting, in the fall of 1946, of the wartime regulation L-85 which controlled the yardage of cloth allowed in any one garment, gave U.S. designers freer scope and allowed them to use fabrics as lavishly as cloth-hungry Paris had in its big collections. It remained to be seen whether or not the U.S. *couture* would want to take advantage of this re-found freedom of design. (See also FURS.) (C. SN.)

FBI: see FEDERAL BUREAU OF INVESTIGATION.

FCA: see FARM CREDIT ADMINISTRATION.

FDIC: see FEDERAL DEPOSIT INSURANCE CORPORATION.

Federal Bureau of Investigation. During the fiscal year 1946 the armed hostilities of World War II ceased. This fact brought about a marked decline in the number of national defense complaints received by the FBI. Statistics in the general criminal field, however, reflected a definite upward trend in many categories. During the fiscal year there were 11,873 convictions in cases investigated by the FBI, which resulted in sentences of 26,624 years, 6 months, 13 days, and in addition, 5 life terms. Fines, savings and recoveries for the year reached a total of \$68,484,935.

There were 10,990 fugitives located and 11,458 stolen automobiles recovered in FBI cases. Investigations resulted in the conviction of 97.3% of the persons brought to trial. During the fiscal year, 6,223 fugitives were located through the identification of fingerprints in the FBI identification division.

Bank Robberies.—During the fiscal year 53 convictions resulted from FBI investigations under the Federal Bank Robbery act, with sentences totalling 377 years, 8 months and 1 day. Fines, savings and recoveries amounted to \$214,312.

Kidnapping.—Thirteen kidnappings occurred during the fiscal year, all of which were solved. There were no demands for ransom involved in these cases. Sentences of 207 years and 1 life term resulted from the 19 convictions in this category during the year. From the enactment of the Federal Kidnapping statute on June 22, 1932, to the close of the 1946 fiscal year, there were 292 kidnappings investigated by the FBI. Of this number 290 had been solved and the remaining 2 continued under active investigation. Forty-five life terms, 14 death sentences and terms totalling 6,701 years, 9 months and 9 days resulted from the 603 kidnapping convictions in state and federal courts from the passage of the act.

Extortion.—A definite increase in the number of cases involving the mailing of threatening letters coupled with a demand for money was noted during the fiscal year. Eighty convictions resulted from prosecutions with sentences totalling more than 261 years and fines amounting to \$12,250. From the passage of the Federal Extortion act in 1932 there had been 1,111 convictions in cases of this type which had been investigated by the FBI, and resulting sentences of more than 4,500 years had been imposed by the courts.

National Motor Vehicle Theft Act.—There were 3,614 convictions for violations of this statute during the fiscal year 1946, as compared with

Above: THE BALLET LENGTH evening dress was popular in 1946

Below: CUT-AWAY DANDY, popular silhouette in suits in 1946. With it, the new, long, skinny umbrella

Circle: THE MOST SIGNIFICANT shoe of 1946 had a closed toe, closed heel and cut-out over toe

Lower right: THE UNEVEN HEM line, long version, was a new fashion note in 1946

2,418 in the fiscal year 1945 and 2,282 in the fiscal year 1941. Eleven thousand, four hundred and fifty-eight automobiles were recovered during the year in cases investigated by the FBI, an increase of 3,566 and 6,787, respectively, over the recoveries in the 1945 and 1941 fiscal years. The convictions for the fiscal year 1946 resulted in sentences of more than 10,853 years. Fines, savings and recoveries amounted to \$9,261,912 and 1,100 fugitives were located.

Theft from Interstate Shipment.—Investigations and convictions coming within the purview of this statute continued at a high level during the 1946 fiscal year. There were 1,023 convictions for violations of the act which resulted in sentences of more than 2,221 years. Recoveries, fines and savings totalled \$436,853.

Theft of Government Property.—There were 1,472 convictions during the 1946 fiscal year for theft, embezzlement or illegal possession of government property, and fines, savings and recoveries amounted to \$664,762 in cases investigated by the FBI.

White Slave Traffic Act.—This statute was passed on June 25, 1910, and was designed principally to curb commercialized vice and prostitution effected through interstate or foreign commerce channels. There were 169 convictions for violations of this statute during the fiscal year ending June 30, 1946, with sentences totalling more than 562 years.

Federal Reserve Act.—More than \$2,250,000 was involved in the 263 cases of possible embezzlement reported during the 1946 fiscal year by banks covered by the Federal Reserve act. In the cases brought to trial there were 108 convictions with sentences totalling more than 410 years. Fines of \$42,752 were levied and savings and recoveries totalled \$620,799.

Antitrust and Anti-Racketeering Laws.—During the fiscal year 1946 the FBI assumed the responsibility for the investigation of all antitrust cases. One hundred and forty convictions resulted from prosecutions under these statutes. While jail sentences were small, fines imposed totalled \$405,700 and savings and recoveries amounted to \$31,248,000.

Bribery.—The control of prices, the necessity for securing priorities for scarce material and the controls placed upon the disposal of surplus war goods contributed to a material increase in the number of violations of the bribery statutes. Forty-one convictions resulted from prosecutions for violations of these statutes during the fiscal year. Sentences totalled more than 93 years, with fines of \$33,341 and savings and recoveries amounting to \$1,720.

Impersonation.—Two hundred and forty-five convictions resulted from prosecutions in this category during the fiscal year. Sentences totalled 568 years, 2 months and 3 days; fines imposed amounted to \$6,376; savings and recoveries totalled \$3,380; and 95 fugitives were located.

Illegal Wearing of the Uniform.—Sentences of 743 years, 6 months and 27 days were meted out in the 730 convictions for this violation during the fiscal year 1946. Savings, fines and recoveries amounted to \$9,284.

Interstate Transportation of Stolen Property.—On the 152 convictions under this act during the fiscal year, sentences totalled 570 years, 6 months and 9 days, while fines, savings and recoveries amounted to \$115,959.

Fraud Against the Government.—Prosecutions of this classification during the 1946 fiscal year resulted in 314 convictions with sentences of more than 419 years imposed. Fines, savings and recoveries amounted to \$9,411,402.

Escaped Federal Prisoners.—Five hundred and ninety fugitives were located through investigations conducted by the FBI under this category, including probation, parole and conditional release violators. Prosecutions resulted in 175 convictions and sentences of more than 407 years were imposed.

Sabotage.—During the fiscal year the FBI received 258 reports of suspected acts of sabotage. From the investigations which resulted in prosecution, there were 12 convictions with sentences totalling more than 53 years. As in the past, it was found through FBI investigations that persons responsible for acts of damage to war materials, equipment and machinery were not motivated by a desire to interfere with or obstruct the war effort, but were prompted by personal reasons such as jealousy, anger or a desire for revenge.

Espionage.—Three axis espionage agents were convicted during the fiscal year. Sentences in these cases totalled 21 years and 11 months. Savings and recoveries amounted to \$3,650,157.

Selective Training and Service Act.—There were 1,809 convictions during the 1946 fiscal year for violations of this act. Total sentences were more than 3,726 years, and fines, savings and recoveries amounted to \$75,110. Two thousand, three hundred eighty-three fugitives were located. A total of 563,703 cases under this act were closed from Oct. 16, 1940, through June 30, 1946. Major emphasis in the enforcement of this act was placed on making men available to the armed forces. Under this program prosecutions were instituted only in those cases which evidenced a wilful violation of the law.

Escaped Prisoners of War.—The escape of prisoners of war interned in the U.S. presented a threat to the security of the country because of their potentialities in the field of espionage and sabotage. For this reason, the war department and department of justice agreed that the FBI should be charged with the responsibility of co-ordinating investigative activities in locating and apprehending escaped prisoners of war. From Oct. 1942, when this agreement was reached, to the close of the 1946 fiscal year, 2,802 prisoners escaped from prisoner of war camps. All but 45 of these prisoners of war had been located or returned to the custody of military authorities as the year ended.

Servicemen's Dependents Allowance Act of 1942.—This act provides for the prosecution of women who illegally marry servicemen to receive allowance checks from the government. During the year 242 convictions resulted as compared with 215 convictions for the previous fiscal year.

FBI Laboratory.—An increase of 73.7% in the volume of work received by the FBI laboratory from state and municipal law enforcement agencies occurred in the fiscal year 1946 over 1945. A total of 67,229 examinations were performed during the fiscal year 1946, and 4,193 of these were for state and municipal agencies.

Identification Division.—In the fiscal year 1946, 5,216,633 fingerprint cards were received and retained by the identification division of the FBI. On June 30, 1946, there was a total of 101,578,578 fingerprint cards in the files.

"DON'T WE ALL LIVE IN GLASS HOUSES?" A humorous commentary by Shoemaker of the *Chicago Daily News* on the activities of international espionage systems during 1946

At the close of the 1946 fiscal year 76 foreign countries, territories and possessions of the U.S. were co-operating in the international exchange of fingerprints.

Uniform Crime Reporting.—Nation-wide police statistics had been received by the FBI from Sept. 1930. This co-operative phase of the work of the FBI is done at the request of the International Association of Chiefs of Police, and pursuant to an act of congress. The reports of local law enforcement agencies are summarized and published in the semiannual *Uniform Crime Reports* bulletin, and furnish a yardstick for interested officials to evaluate the extent and fluctuation of crime in individual communities. During 1946 there were 5,531 local agencies voluntarily participating in this program by sending reports to Washington, D. C.

Juvenile Delinquency.—An examination of the 543,852 fingerprint arrest records received at the FBI during the calendar year of 1945 reflected that age 17 stood out as the predominating age among arrested persons and age 18 was second. Arrests of males under 21 increased 10.1% in 1945 and although arrests of girls under 21 declined 10.6% in 1945 the figure still was 109.3% in excess of that for 1941, the last peacetime year. (See also CHILD WELFARE; CRIME; JUVENILE DELINQUENCY; KIDNAPPING; POLICE; SECRET SERVICE, U. S.) (J. E. H.)

Federal Communications Commission. Removal of wartime restrictions deluged the commission in 1946 with an unprecedented number of requests for radio facilities. Development of new apparatus and techniques made it possible to extend the radio spectrum from its prewar "ceiling" of 300 megacycles to 30,000 megacycles. This makes room for new services on the higher frequencies besides permitting expansion of some older systems.

The year closed with 1,200 licensees in the broadcast field, plus 1,400 additional authorizations and 1,000 applicants. In addition, there were 124,000 licensees in other radio services and 315,000 commercial operators. Regulation of common carriers involved consideration of 27,000 pages of tariff filings. Altogether, more than 200,000 applications of one type or another were received and nearly 200,000 authorizations were issued.

For the first time in the history of the commission, standard (amplitude modulation) broadcast stations passed the 1,000 mark, with more than 400 additional stations receiving construction permits. The newer FM (frequency modulation) broadcast service saw 100 stations on the air and more than 600 others under construction. Television had 50 authorizations for black-and-white broadcast and colour television was being considered

for commercialization. Noncommercial educational stations numbered 27 licensed or authorized, 37 stations continued international broadcast and 40 stations engaged in developmental work.

Survey of broadcast programs caused the commission to conclude that, while the listeners must primarily turn to stations and networks rather than to federal regulation for program improvement, the commission had the statutory responsibility of reviewing over-all service in the light of public interest and promises made in applying for the privilege of using the public's radio channels.

In the nonbroadcast field, two new services were established—one for railroad safety and the other for public utility use. Facsimile made marked experimental progress. Mobile equipment was being tested with a view to linking passengers in trains, buses, taxis, boats and aircraft with the telephone system, also for dispatching vehicles. Another contemplated service would enable individuals to use "walkie-talkies" and other portable two-way apparatus at home, work or play.

Telephone progress saw radio being used to serve communities too isolated for wire-line extensions. Following hearing the commission proposed that recording devices be made standard telephone equipment under adequate notice to telephone users that such apparatus was in use. Radiotelephone service was restored to 50 foreign points.

Faced with increasing airmail, telephone and other competition, the now unified telegraph system was granted a 10% rate increase and later asked for an additional 15% increase, while the commission undertook study of the future of this oldest form of electrical communications. Radiotelegraph service was resumed with 70 foreign points. The 120,000 mi. of U.S. cable remained unchanged.

The year saw total licensees in the various nonbroadcast radio services as follows: amateurs 100,000; aviation 11,000; ship 10,000; police, fire and forestry 4,000; experimental 1,200; mobile 1,000; coastal 700; special emergency 650; geological 500; utility 350; provisional 260; railroad 100; miscellaneous 200. (See also RADIO.) (C. R. D.)

Federal Council of the Churches of Christ in America.

In 1946 the council in the U.S. consisted of 25 national denominations, including most of the major Protestant bodies and three of the Eastern Orthodox group, and representing approximately 28,000,000 members in 140,000 local congregations. Two of the constituent denominations, the Evangelical Church and the United Brethren in Christ, united in Nov. 1946 to form "The Evangelical United Brethren Church." An additional denomination, the Czech-Moravian Brethren, became a member of the council.

A special meeting of the council was held in Columbus, O., March 5-7, 1946, to deal with the common responsibilities of the churches in the postwar period. On this occasion the council was addressed by Pres. Truman.

The biennial meeting of the council was held in Seattle, Wash., Dec. 4-6, 1946. At this time Charles P. Taft of Cincinnati, O., was elected president and Bishop John S. Stamm of Harrisburg, Pa., vice-president. Harper Sibley of Rochester, N.Y., was re-elected treasurer.

The program of relief and reconstruction in the neediest territories of Asia and Europe was carried forward through Church World Service, Inc., which raised about \$1,000,000 a month through the churches. On approval by the secretary of war, a liaison representative between the churches and the U.S. military government in Germany was appointed. The general secretary of the council Rev. Samuel McCrea Cavert, was the first

appointee, succeeded by Dr. Julius Bodensieck, president of Wartburg Theological seminary.

The council increased its program of evangelism on a community-wide basis through home visitation evangelism and special missions to educational institutions. It co-operated with the radio networks in presenting the challenge and inspiration of religion.

In the field of race tensions the council continued to develop race relations clinics in numerous cities, bringing together, under the initiative and auspices of the churches, the institutional and professional resources of the community to diagnose the causes of tension and to formulate plans for improving the community health.

The Commission on a Just and Durable Peace arranged an international conference of church leaders at Cambridge, Eng., in August, which resulted in the formation of a permanent "Commission of the Churches on International Affairs," sponsored by the World Council of Churches and the International Missionary council.

In October the Federal council issued a comprehensive pronouncement on "Soviet-American Relations." It also began preparations for a national study conference on "The Relation of the Churches to Our Economic Life."

In December the council brought Martin Niemöller, the antinazi German pastor, to the U.S. for a series of meetings of Christian witnesses in about 40 cities.

A new "Commission on the Ministry" carried on a program of co-operative effort in interesting young people, especially those who had been in the armed forces, in the Christian ministry as a lifework.

The usual programs in such fields as worship, home and family life, religion and health, industrial relations and research and education, were continued.

The *Federal Council Bulletin* (monthly), *Information Service* (weekly), *Interracial News Service* (bimonthly) and *Town and Country Church* (monthly) give current information about the work of the council. (S. McC. C.)

Federal Deposit Insurance Corporation.

Not a single bank failed in the United States during the year 1946, marking the second calendar year without a bank failure. The last failure occurred in May 1944. During 1946, as during each of the preceding three years, the Federal Deposit Insurance corporation made an advance to an insured bank which was in financial difficulty to facilitate its merger with a strong insured bank. In none of these cases did the depositors suffer any loss.

As of Dec. 31, 1946, the total capital and surplus of the corporation exceeded the \$1,000,000,000 mark for the first time in its 13 years of operation. The corporation therefore suggested that the initial capital of \$289,000,000, subscribed by the treasury and the federal reserve banks, be repaid to eliminate this subsidy to the banking system. However, this retirement of the original capital should be at such a rate as at no time to reduce the corporation's resources below an amount considered adequate to protect depositors in insured banks.

While during the year 1946 total deposits in the 13,500 insured banks decreased, the contingent liability of the corporation as an insurer of deposits in these banks continued to increase. The decline in total deposits occurred chiefly in deposits of the U.S. government which are protected to only a small extent by the \$5,000 maximum insurance coverage for each depositor, while the growth in insured deposits was caused by the increase in deposits of the general public, particularly in savings deposits, a large proportion of which are protected by insurance.

During 1946 the corporation granted charters to 157 new

federal credit unions, cancelled 151 charters and examined the majority of the 3,800 credit unions in operation.

Maple T. Harl, former state bank commissioner of Colorado, took the oath of office as chairman of the board of directors of FDIC on Jan. 5, 1946, succeeding Leo T. Crowley, who had resigned effective Oct. 15, 1945, after nearly 12 years of service. The death on Oct. 22, 1946, of Sen. Phillips Lee Goldsborough, who had served as a member of the board of directors from April 29, 1935, caused a vacancy on the board which had not been filled by the end of the year. Preston Delano, comptroller of the currency, continued as ex officio member of the board. (See also BANKING.) (M. T. H.)

Federal Power Commission. Natural gas expansion on a large scale was the outstanding feature of the year 1946 in public utilities regulated by the Federal Power commission. More than \$300,000,000 construction in new pipe lines and extensions of existing lines was authorized in 18 months, with nearly as much more involved in projects proposed and pending. New construction and operation authorizations to make available to 71 large cities and many smaller communities an additional volume of more than 1,000,000,000 cu.ft. of gas daily were included in the 90 certificates of public convenience and necessity issued by the commission between July 1, 1945, and Sept. 30, 1946. These involved 4,465 mi. of new gas pipe lines, and installation of 276,535 compressor h.p., at an estimated total cost of \$193,576,544. More than \$100,000,000 was involved in the large Michigan-Wisconsin pipe line authorized after that time, and in other extensions increasing the gas supply of Michigan, Wisconsin, Illinois and other midwest areas. El Paso Natural Gas company and Southern California distributors were constructing a 1,200-mi. pipe line from western Texas to California which would utilize vast quantities of the casinghead gas which were "flared" and wasted in oil production. Tennessee Gas and Transmission company was largely increasing the capacity of its 1,265-mi. line from eastern Texas to West Virginia and was operating the "Big Inch" and "Little Big Inch" pipe lines under temporary lease, supplying gas to midwestern cities and the Appalachian area. Natural Gas Pipeline Company of America and Texoma were providing for large increases in the gas supply of the Chicago area, Illinois and Iowa. Northern Natural Gas company was enlarging facilities to supply Iowa, Minnesota and Nebraska localities. United Gas Pipe Line company, Southern Natural Gas company and others were building new lines to meet southern demands, while Hope Natural Gas and other companies were enlarging facilities to supply Pittsburgh, Ohio cities, Pennsylvania and western New York. Panhandle Eastern Pipe Line company, Cities Service Gas company and other leading concerns were planning major extensions of their systems. There were numerous bidders for the government's war-built "Big Inch" and "Little Big Inch" oil pipe lines who planned to transport natural gas in vast volume from Texas east to New York and New Jersey.

After a year of hearings in the chief producing and consuming centres, the commission completed the most comprehensive investigation of the natural gas industry ever undertaken. State officials, producers, pipe-line executives, geologists, engineers, consumers, coal miners' union and railroad interests testified as to reserves, demand, consumption, markets, prices, costs and every phase of the industry, and were awaiting with interest the

commission's conclusions in its report to congress.

Power production for public use in 1946 rose slightly above 1945 to an estimated total of 223,339,000,000 kw.hr. Combined utility and industrial production was estimated at approximately 269,000,000,000 kw.hr. Installed generating capacity of plants in utility service on Nov. 30 totalled 50,257,598 kw., while industrial capacity was 12,734,776 kw., making the country's combined generating capacity 62,992,374 kw. After the coal strike ended, electricity demand rose rapidly, weekly output reaching, in the week ended Dec. 14, an all-time high of 4,777,943,000 kw.hr. Rate reductions were the largest in some years, the industry reported; nearly 2,000,000 customers were added, more than 500,000 farms connected to electric lines and average consumption per customer rose to 1,330 kw.hr.

Fifteen new applications for preliminary permits and licences were received by the commission during the fiscal year, five of which were for major projects aggregating 307,515 h.p. Power possibilities of 314 reservoir projects in the war department's river basin program were studied, bringing the total investigated from 1938 to 656 such projects in 44 states.

Closer co-operation with state regulatory commissions was assured by a revised plan recommended by the National Association of Railroad and Utilities Commissioners, adopted by 16 state commissions and approved by others. Simplified methods of procedures and new regulations were adopted, while pre-hearing conferences and other improvements expedited proceedings. River basin and power marketing studies were made in important areas. Electric plant accounting adjustments, involving write-ups and other charges in excess of the commission's original cost requirements, enforced after 1937, reached a total of \$1,111,604,052.

After almost continuous service for nearly seven years, Leland Olds, of New York, N.Y., resigned the chairmanship, remaining as a member of the commission. Nelson Lee Smith, of New Hampshire, was elected chairman and Richard Sachse, of California, vice-chairman. (J. W. JE.)

Federal Public Housing Authority: see HOUSING.

Federal Reserve System. Federal reserve authorities devoted much attention to the continuing implications for monetary and credit policies of the wartime growth in the public debt. It is possible for commercial banks to readily acquire reserve funds by sale of short-term, lower-yielding government securities to the reserve banks. Such additional reserve funds can support, on the present basis of reserve requirements, a sixfold expansion of member bank credit. Use of such additional reserve funds in the purchase of longer-term, higher-yielding government bonds in the market and the consequent further monetization of the public debt can result in a further increase in the stock of bank deposits and downward pressure on interest rates. On the other hand, application of restrictive central banking policies of the traditional type would increase the level of interest rates and raise formidable questions concerning the interest charge on the public debt and the market values of outstanding government bonds.

In its annual report, the board of governors of the federal reserve system outlined three measures for preventing further monetization of the debt which it believed worthy of consideration by congress. The first proposal, the "bond limitation" plan, would be to give the board power to place a maximum on the amounts of long-term marketable securities, both public and private, that any commercial bank may hold against its net demand deposits so as to restrict demands by the banks for longer-term government bonds and to strengthen their demands for short-term, lower-yielding securities. A second proposal, a "sec-

ondary reserve" plan would be to empower the board to require all commercial banks to hold a specified percentage of treasury bills and certificates as secondary reserves against their net demand deposits. The third proposal, the "primary reserve" plan, would give the board additional power to raise reserve requirements, within specified limits, against net demand deposits. These reserve requirements would apply to all commercial banks, member and nonmember, and would be held in the form of deposits with the reserve banks.

Federal reserve holdings of government securities stood at \$23,350,000,000 on Dec. 31, 1946, having declined \$912,000,000 during the year. Holdings of certificates of indebtedness, treasury notes and treasury bonds showed a decline, reflecting the debt retirement program, while holdings of treasury bills rose \$1,914,000,000. At the end of 1946 treasury bills held by the federal reserve banks comprised almost two-thirds of their government security holdings and seven-eighths of the treasury bills outstanding.

In April the federal reserve banks eliminated the wartime preferential discount rate of .5% on advances to member banks secured by government obligations due or callable in not more than one year. The preferential rate had been adopted in 1942 as a means of inducing the banks to utilize their reserves more fully in financing World War II expenditures. The rate was discontinued in order to discourage the undue use of reserve bank credit by member banks. The board of governors of the federal reserve system stated that discontinuance of the special rate, however, would not involve any increase in the cost to the government of carrying the public debt. The board gave assurance that the rate of .78% on one-year certificates would be maintained, if necessary, through open market operations.

Effective Jan. 21, 1946, the board of governors amended regulations T and U to raise margin requirements to 100% in order to dampen speculative activity in the stock market. These regulations are applicable to credit extended by brokers and banks to finance purchasing, carrying or trading in stock exchange securities. Margin requirements were continued at 100%.

The board of governors amended regulation W relating to consumer credit, effective Sept. 3, 1946, by making the regulation applicable to all consumer credits up to \$2,000 instead of only those up to \$1,500, and by reducing the maximum maturity from 18 months to 15 months for instalment loans that were not connected with the purchase of consumers' durable or semi-durable goods. Later in the year, effective Dec. 1, the board narrowed the scope of the regulation by focusing it on instalment credit and centring it on purchases of major consumers' durable goods. Charge accounts and single-payment loans were eliminated from the scope of the regulation. The list of consumers' durable goods to which down payment and maturity requirements apply was reduced from 36 categories to the 12 major categories of such goods. The provisions of the regulation were substantially simplified by the revision. In its annual report to congress, the board recommended that congress give consideration to legislation which would continue the regulation of consumer credit by the federal reserve system on a permanent basis to assist in the maintenance of economic stability at a high level of production and employment. (See also BANKING; CONSUMER CREDIT.) (J. K. L.)

Federal Savings and Loan Insurance Corporation: see HOUSING.

Federal Security Agency. Victory for the United States and its allies in World War II had its effects on the work of the Federal Security agency. Immediate steps were taken to conclude the several

special programs that had been assigned to the agency ancillary to the prosecution of the war. By June 30, 1946, most of these efforts had been brought to conclusion and liquidation was nearing completion.

The Office of Community War Services, which had through the war years carried the heavy load in looking to the war-created needs for the provision of health, medical care, welfare, recreation, education, social protection and related services, was the strong arm of the government in the security field. It demonstrated, in the stress of war, the validity of integrated effort for health, education and welfare.

The Surplus Property administration (later the War Assets administration) requested that the Federal Security agency assist it in seeking to implement the will of congress that surplus war property be disposed of to nonprofit institutions and instrumentalities at a value which would take into account benefits accruing to the United States from the use of such property by such agencies. To this end the Office of War Property Distribution, established in the Office of the Federal Security administrator, co-operated with and acted as the agent of the War Assets administration. Through facilities of the public health service, the office of education and the Social Security board, procedures and policies were fostered to aid distribution of needed property to health, educational and welfare agencies. In addition, this agency was concerned with donations of excess property by the army and navy to educational institutions under statutes other than the Surplus Property act. By the close of the fiscal year the mission of the Federal Security agency in this field was nearing completion.

With increasing freedom from wartime functions it was possible to turn more adequate attention to the agency's peacetime work carried on through its continuing units—the U.S. public health service, U.S. office of education, federal Food and Drug administration, Social Security administration, federal office of vocational rehabilitation, Saint Elizabeth's hospital for the mentally ill, Howard university, Columbia Institution for the Deaf, American Printing House for the Blind and Bureau of Employees Compensation.

Evidences of extensive interest in the security fields were in prominence during 1946. During the second session of the 79th congress there were under consideration several hundred bills seeking to improve the security programs. In subject matter these bills were about equally divided between education, health and welfare. Congressional committees held extensive hearings treating with these subjects, while President Harry S. Truman in three messages focused the attention of congress and the people on urgent, unmet needs. On Sept. 6, 1945, less than a month after the fighting stopped, the president called for legislation on the broad front to implement and give substance to what Franklin Roosevelt had called the "Economic Bill of Rights." This was followed by the historic Health message of Nov. 19, 1945. Again, in the State of the Union message of Jan. 21, 1946, the key importance of security needs was highlighted. Summarizing, the president said:

Our basic objective—toward which all others lead—is to improve the welfare of the American people. In addition to economic prosperity, this means that we need social security in the fullest sense of the term; the people must be protected from the fear of want during old age, sickness and unemployment. Opportunities for a good education and adequate medical care must be generally available.

The congress was responsive in its concern for health, education and welfare, and prior to sine die adjournment sent to the president four acts of far-reaching importance in these fields: (1) the National Mental Health act (P.L. 487), (2) the Vocational Education act of 1946 (P.L. 586), (3) the Social Security Act amendments of 1946 (P.L. 719) and (4) the Hospital Survey and Construction act (P.L. 725). (W. B. Mr.)

Federal Trade Commission. The Federal Trade commission, under congressional mandate, protects public and ethical business against unfair business practices. It administers the Federal Trade Commission act, portions of the Clayton act, the Wool Products Labeling act and the Webb-Pomerene act and makes general economic investigations at the request of the president, the congress, or upon its own motion.

The Lanham Trade-Mark act, approved July 5, 1946, to become effective one year later, delegates to the commission important duties in respect of proceedings looking toward cancellation of certain types of registered trade-marks.

In 1946 the commission issued 64 complaints alleging violations of laws under its jurisdiction, entered 78 orders to cease and desist from proved violations and accepted 137 stipulations wherein respondents agreed to discontinue unlawful practices. These proceedings were directed to preventing price-fixing agreements and restraint-of-trade combinations, unlawful discriminations in price and otherwise, misbranding of wool products and other unfair methods of competition and unfair or deceptive acts or practices in interstate commerce; and to safeguarding the public by preventing the dissemination of false advertisements of food, drugs, curative devices and cosmetics, particularly those which might be injurious to health.

The commission reported to congress its investigation of the wholesale baking industry, suggesting that the executive and legislative branches determine "what legislation, if any, is needed to permanently eliminate wasteful trade practices and predatory competition which threaten the existence of many small bakers, foredoom new ventures to failure and promote regional monopolistic control of the wholesale bread baking industry." Other reports dealt with international phosphate cartels and the cost of producing and distributing fish on the Pacific coast.

The commission conducted inquiries to determine whether several export associations organized under the Webb-Pomerene act were complying with law, and recommended that one engaged in exporting Florida pebble phosphate readjust its business to conform to law. Fifty-two export associations were registered with the commission.

In 1946, with approval of the president and congress, the commission adopted procedural policies looking toward industry-wide elimination of unfair practices wherever practicable, thus securing more effective co-operation of business in promptly and economically affording protection to business and the public against widespread unfair practices. Where circumstances warrant, corrective action on an industry-wide basis to eliminate unfair practices is fostered on a co-operative basis through establishment of trade practice rules or by simultaneous negotiation of voluntary stipulations to cease and desist.

Trade practice rules were approved during the year for these industries: construction equipment distributing, piston ring, masonry waterproofing products, artificial limb, wholesale confectionery (Philadelphia trade area) and saw and blade service. Proceedings for establishment of rules were in progress for the protein base fibre, baby chick, household dye and watchcase industries.

Noting a sharp increase in the merger movement after the end of the war, the commission recommended that congress amend the Clayton act to prohibit the corporate acquisition of another corporation's assets under the same conditions that acquisition of its capital stock had been declared unlawful in 1914.

It also recommended that Clayton act enforcement procedure be amended to conform to Federal Trade act procedure including similar violation penalties.

(R. E. F.)

Federal Works Agency. The Federal Works agency, whose constituent units are the Public Roads administration, the Public Buildings administration and the Bureau of Community Facilities, during 1946 sought two main objects: (1) holding public construction to a minimum to give right of way to pent-up demands for private construction, especially housing, and (2) stimulating the plan preparation of needed public works against the day when labour and materials should become available.

The advance planning program carried on through the Bureau of Community Facilities made rapid progress. The congress had appropriated a total of \$65,000,000 for advances to finance the complete plan preparation by states and their subdivisions of needed public works. Advances were to be repaid without interest when construction of the planned projects was begun. By the end of the year, more than \$43,000,000 had been advanced to finance the plan preparation of local public works with a total estimated cost of about \$1,717,000,000. Applications were on file for advances totalling more than \$35,000,000.

Passage in Aug. 1946 of the Mead act (Public law 697—79th congress) made the Federal Works administrator responsible for providing nonhousing facilities to public and nonprofit educational institutions overcrowded by veterans seeking education or training under the G.I. Bill of Rights. This was done by the conversion into classrooms, laboratories, etc., of government-owned surplus buildings, which in most instances were re-erected at the institutions, and by the re-use of suitable furniture and equipment from government surplus. The program was administered through the Bureau of Community Facilities. Of \$100,000,000 authorized for carrying out this program, \$75,000,000 had been appropriated. By the end of the year about 700 applications from educational institutions had been approved. They came from each of the 48 states, the District of Columbia and Puerto Rico and called for the expenditure of about \$52,000,000.

Construction of federal buildings by the Public Buildings administration was virtually suspended during the year. Under legislation enacted by the congress the preparation of plans and specifications for federal buildings on government-owned sites was begun, so that construction could be started without delay whenever authorized. The principal contracts let during the year were for five hangars at the Washington National airport for the Civil Aeronautics administration; Federal Office centre, Denver, and the West Central Heating plant, Washington, D.C. The total amount involved was a little more than \$10,000,000. During the 15 months ended Dec. 31, 1946, the Public Buildings administration did about \$12,000,000 of alterations and remodelling in space throughout the United States acquired for the Veterans' administration. It also did a substantial amount of alterations and remodelling to buildings on college and university campuses for the Bureau of Community Facilities, as part of the veterans' educational facilities program.

The states, in co-operation with the Public Roads administration, made a beginning on the largest highway construction program in the history of the United States; however, owing to adverse economic conditions, much less work was accomplished than had been anticipated.

At the request of the president the Federal Works administrator spearheaded a campaign to reverse the upward trend of traffic accidents. The campaign opened with a conference at Washington, D.C., of which the administrator was chairman, attended by governors of states, mayors of cities and police, motor vehicle and highway officials from all parts of the United States. It adopted an action program based on the "three E's" of enforcement, education and engineering. Subsequently state and metropolitan traffic safety conferences were held. Later, the administrator was made chairman of a federal committee on

highway safety to co-operate with state and local agencies in matters of highway safety. (See also HOUSING.) (P. B. F.)

Federated Malay States: see MALAYAN UNION AND SINGAPORE.

Federation of Labor, American: see AMERICAN FEDERATION OF LABOR.

Feldspar. Sales of crude feldspar in the United States rose from 366,697 short tons in 1944, to 417,820 tons in 1945, accompanied by an 11% increase in value as compared with a 14% increase in quantity. Sales of domestic ground spar totalled 372,377 tons, and of ground Canadian spar 9,351 tons, making a total of 381,728 tons, of which 65.5% was used in glass and 29% in pottery. In spite of a growing use of competing products in the making of glass, the consumption of feldspar in glass continued to expand.

Canadian shipments of feldspar rose from 23,509 short tons in 1944 to 28,047 tons in 1945, and to 14,637 tons in the first half of 1946. (G. A. Ro.)

Fencing. The end of the war and the return home of the hundreds of fencers from military service resulted in a great upswing in fencing throughout the United States. Four divisions of the Amateur Fencers League of America, inactive because of war, renewed their fencing activities, and two new divisions were granted charters.

The United States championships, held in New York city, June 8-14, 1946, had the largest number of entries after 1940. In the team events, the Calnan Memorial trophy for three weapon teams was won by the New York Athletic club team of Dernel Every, Henrique Santos and James Flynn. In the women's event the Fencers club team of Maria Cerra, Helena M. Dow and Ruth Maxwell retained its title. The men's individual championship was won by José de Capriles (Salle Santelli). Nathaniel Lubell of the Fencers club was second and Dernel Every (New York Athletic club), the defending champion, was third. The épée individual championship was won by Albert Wolfe (unattached) former French Internationalist in fencing. He was followed by former champion José de Capriles (Salle Santelli), with Tracy Jaeckel (Fencers club) third. The sabre individual championship was regained by Tibor Nyilas (Salle Santelli), followed by the defending champion, Norman Armitage (Fencers club), with José de Capriles third. Winning the bronze medal in sabre (the last event) made De Capriles the first fencer after 1924 to place in the national championships in all three weapons. After being out of competition for three years, the former U.S., Olympic and World champion, Helene Mayer (San Francisco Fencers club) returned to the tournaments to capture her 8th national title. She was followed by the former champion, Helena (Mroczkowska) Dow and Ruth Maxwell, third, both of the Fencers club.

The Pacific coast championships were held in Los Angeles. Edward Carfagno (Los Angeles Athletic club) retained his foil title but lost his sabre crown to Salvatore Giambra (Olympic club of San Francisco). Dell Reynolds, also of the Olympic club, took the épée event. Miss Helene Mayer (San Francisco Fencers club) won the women's title.

The midwest championships were held in Dayton, O.; Byron Krieger and Paula Sweeney, both from the Salle de Tuscan, Detroit, Mich., retained their foil titles in the men's and women's events respectively. R. Goldstein (Dayton Fencers club) won both the épée and sabre championships. (W. A. Dw.)

Fertilizers. While the undersupply of food that prevailed during 1946 in the defeated countries of World

War II arose partly from the food allocation policies of the victors, the terrific decrease in chemical plant foods available in the former enemy nations was directly responsible for much of the existing hunger and incidental unrest, disease and death.

How serious is the loss of, say, 2,500,000 tons of nitrogen, phosphoric acid and potash? From 1937 to 1946 the average plant food content of U.S. fertilizers was about 20%. Hence, 2,500,000 tons of plant food will produce about 12,500,000 tons of fertilizer. This is about 450,000 tons more than total U.S. consumption in 1944. The United States, with a population (1940 census) of 131,669,000, cultivates yearly about 360,000,000 ac. Well-informed government experts estimated that it would take 50,000,000 additional acres of reasonably fertile land to produce the crops resulting from fertilizer use. That is about 2,000,000 ac. more than the 47,916,000 ac. of arable land in prewar Germany which then was about 2½ times the size of Kansas and had a population of 79,375,000. In comparison, Japan had a population of 72,876,000 and only 14,918,000 ac. of arable land. The United States has about 7½ times as much arable land as Germany and 24 times as much as Japan.

Examples of the varying pressures of population on arable land are as follows:

	Square miles of arable land	Persons per square mile	Pounds of plant food per acre used prewar
United States	530,064	248	8.8
Germany	74,867	1,060	96.0
Japan (proper)	23,309	3,127	86.8

Next in interest to the decreases of plant food available in the defeated nations is the increase in fertilizer use in many of the victorious countries. Figures for the U.S.S.R. were not available in 1946, but the figures for three of the Anglo-Saxon countries disclose the situation.

Table I.—Consumption of Plant Food in U.S., U.K., and Canada (In short tons)

	Prewar	1945-46	Increase
United States	1,502,200	2,799,400	1,297,500
United Kingdom	338,300	712,300	373,700
Canada	78,600	143,500	64,900
Total	1,919,100	3,655,200	1,736,100

The outlook for quick recovery of the fertilizer industry in Europe was not good at the close of 1946.

Adequate nitrogen supplies are essential to intensive farming, especially on lands that have been cultivated for many centuries. Germany has a nitrogen-production capacity of 1,368,357 tons, only 119,700 of which is by-product, but production for 1946 promised to be only 137,500 tons. All other European countries except Italy showed some increases. Norway increased from 7,900 to 23,900 tons.

Life is impossible without phosphorus. Every living cell, both animal and vegetable, contains it. The United States, French North Africa and the U.S.S.R. own the world's greatest deposits of phosphate rock. Europe has practically none. Most European nations obtain their phosphates almost exclusively from that mineral. Ordinarily, Germany obtains about three-fourths of its phosphates from the basic slag wastes of its steel industry. As that industry in 1946 was paralyzed by lack of food and coal and of a unified reconstruction policy, farming too was prostrate.

For many decades Germany supplied the world with nearly all its potash. In 1946 soviet deposits were said to be about five times greater than those in the rest of the world. Even so, the Potsdam agreement assigned the soviet union nearly all of the Polish mines and 61% of the German mines. Of the remainder, 22% was in the British zone; 14% in the U.S. and 3% in the French. France, in addition, had the protection of the rich Alsatian deposits.

In the United States, some of the outstanding features of the fertilizer industry, aside from the tremendous gain in consumption (and hence production) already mentioned, were:

1. The great increase in nitrogen-fixation capacity, totalling 1,520,000 tons, as a result of the construction of 9 government plants under wartime authority and appropriations. Their capacity plus that of the government Tennessee Valley Authority plant at Muscle Shoals was 750,000 tons. During 1946 some of these plants were sold, some were leased and four were reactivated by the army to produce nitrogen for occupied areas in Japan, Korea and Germany. Private enterprise owned 9 synthetic plants with a capacity of 500,000 tons, and about 94 by-product ammonia plants which produced 215,000 tons when the steel industry was in a state of relatively high activity. In addition, private enterprise made about 50,000 tons of organic nitrogenates available yearly for fertilizer. Hence, the total supply private industry was able to provide in 1946 was about 765,000 tons. The U.S. capacity of 1,520,000 tons was almost identical with the German 1937 capacity of 1,505,000 tons. According to the War Production board, U.S. consumption was 631,000 tons for the year ended June 30, 1944, about 53% more than had been used in any prior year; and in 1945-46 it was 680,600 tons. Alongside U.S. capacity, Canada, using about 21,000 tons yearly, built up a production capacity of 250,000 tons in 3 privately built and 3 government-built plants. North America, with a consumption of almost exactly 700,000 tons in 1946, had a producing capacity of almost 1,800,000 tons.

2. The occurrence of local and sometimes regional shortages despite prodigious increases in production of plant food carriers. These resulted from the almost incredibly rapid growth in consumption, stimulated by high farm income, government-managed farm programs and spread of agronomic and economic information regarding fertilizer use. Export allocations of U.S. plant food carriers by the Combined Food board and its successor, the International Emergency Food council (a United Nations agency under the Food and Agriculture organization) necessarily took supplies that might otherwise have covered domestic needs. Fertilizer consumption increased from 7,707,000 tons in 1939 to about 14,000,000 tons in 1946. Production of superphosphate rose from 4,198,000 to more than 8,000,000 tons in 1945-46. Production of potash was 312,000 tons in 1939 and nearly 909,000 tons in 1945-46.

3. Removal of wartime controls. Price ceilings were terminated Nov. 10, 1946. Allocations of fertilizer materials to domestic purchasers had been discontinued Sept. 30, 1945, but their effect continued largely until June 30, 1946, because of contractual arrangements between buyers and sellers made prior to discontinuance of allocations. The only control effective Jan. 1, 1947, was potash allocation which had been reinstituted July 1, 1946, and which was under consideration for removal on March 31, 1947. As of Jan. 1, 1947, international allocations were still being continued. They were informal, inter-governmental understandings based upon recommendations made by the fertilizer subcommittee of the Food and Agriculture organization. To fulfil United States commitments, directives were issued by the Office of Temporary Controls (formerly Civilian Production administration) which required domestic producers of materials to set aside or to ship certain amounts of their production. Fields, W. C. (CLAUDE WILLIAM DUKENFIELD) (1880-1946), U.S. comedian, was born Jan. 29, in Philadelphia, Pa. At the age of 11, he ran away from home. He entered the show business as a juggler, and after many years of hardship and privation, finally emerged as a great comedian in the 1920s when he was engaged for a between-the-acts stint for the Ziegfeld Follies. Shortly afterward, he entered the motion pictures, immediately achieving outstanding success. Possessed of a bulbous nose and a rasping and powerful voice, Fields was an accomplished mimic with a caustic wit, who seldom, it was said, ever followed the script. The one exception was in the role of Mr. Micawber in *David Copperfield*, one of his most memorable "straight" portrayals. His "dead-pan" expression and his "know-it-all" attitude, coupled with his sardonic remarks, made Fields a nationally known character and a well-loved comedian on the screen and over the radio. Openly boastful of his alleged capacity to consume large quantities of spirits, he at one time confided that he could not drink a certain effervescent sedative because he "couldn't stand the noise." His motion pictures included *Mrs. Wiggs of the Cabbage Patch*, *Poppy*, *You Can't Cheat an Honest Man*, *Six of a Kind* and *Never Give a Sucker an Even Break*. He died at Pasadena, Calif., Dec. 25.

Finland. An independent republic of northern Europe. Area, 134,000 sq.mi. (land area, 121,000 sq.mi.), after cession of 13,500 sq.mi. to the U.S.S.R. in 1940 and 1944. Pop. (est. Jan. 1, 1945) 3,947,702. Capital, Helsinki; pop. (est. Jan. 1, 1945) 331,192. Other principal cities: Turku (Åbo) (74,351); Tampere (76,730). Language and nationality, 90% Finnish, about 10% Swedish. Religion, Lutheran Christian. President (to March 1946): Carl Gustav von Mannerheim; president after March 1946: Juho K. Paasikivi. Paasikivi, who was prime minister until March, was succeeded in that post by Mauno Pekkala.

History.—Finland's troubles did not end when it made peace with the U.S.S.R. and Great Britain on Sept. 19, 1944. The reparations of \$300,000,000 were heavy (though but half the original demand); the contraction of territory by loss of the Petsamo area, Viipuri and the Karelian region meant a shift of more than 10% of Finland's population as well as loss of points of great economic importance. The lease of strategic Porkkala-Udd to the U.S.S.R. was painful both to pride and to the communications system.

The basic policy of the Finnish government, personified in Juho K. Paasikivi (premier until March, thereafter president), was one of internal reconstruction and conciliation with the soviet union. Paasikivi was able to hold together the widely differing factions within the country, and at the same time to steer a cautious course acceptable to the great communist neighbour. Essentially he was continuing the policy followed by Mannerheim from 1944.

The war criminal trials presented a major problem, because they were held on Russian insistence, and they involved some of Finland's outstanding political leaders. The numbers were kept to a minimum, however. An investigating commission was set up in 1945, and on Nov. 8, 1945, eight men were dramatically arrested. Trials began on Nov. 15. The leaders charged

with war guilt and their former positions were: Risto Ryti, president; Edwin Linkomies, premier; Johan W. Rangell, premier; V. A. Tanner, minister of finance and head of Social Democratic party; Tyko Reinikka, minister of finance; Henrik Ramsay, minister of foreign affairs; Antti Kukkonen, minister of interior; Toivo Kivimaeki, minister to Berlin. The first sentences of the Finnish supreme court were too light to satisfy Gen. A. A. Zhdanov and the control commission, and had to be revised. As announced on Feb. 21 the final verdict levied on Ryti a ten-year term at hard labour; Tanner, five and a half years; Rangell, six years; Kivimaeki, five years; Ramsay, two and a half years; Kukkonen and Reinikka, two years each.

On March 4, 1946, President Mannerheim submitted his resignation, and the cabinet was obliged to accept it, recommending that the diet elect a successor to fill out the term. Although he left office in a time of national tragedy, he was generally recognized as the great man of Finland's period of independence.

The diet, by a vote of 159 to 14, on March 9 elected as president the premier, non-party Juho K. Paasikivi, 75, who had so often negotiated with the Russians. He took the oath of office March 11, and then had to find a premier to succeed himself. After considerable difficulties Mauno Pekkala, former defense minister, formed a cabinet (March 24). Carl J. H. Enckell, an Independent, remained as foreign minister, six ministers were from the Popular Democratic party, which includes the communists, five were Social Democrats, five Agrarians and one of the Swedish party. It was more leftist than Paasikivi's cabinet.

Economic conditions were bad, yet the Finns, inured to misfortune, were making real recovery. The rubble of bombings was cleared away in Helsinki, houses were being built to care for the homeless Karelians and others and reparations payments were kept up to date. A U.S. credit of \$35,000,000 was granted by the Export-Import bank, trade was maintained with Sweden

and a trade treaty negotiated with the U.S.S.R. in May. In Aug. 1946 it was decreed that Finnish citizens must turn over to the Bank of Finland shares and bonds in foreign firms to give the government foreign purchasing power. The Finns were using every means available to rebuild their strength.

Toward the end of the year tension appeared to be increasing in Finland. Inscriptions on historical monuments were being revised, to eliminate references to battles with "Russian Devils." Attempts to placate the U.S.S.R. and appointments of leftists to an increasing number of diplomatic posts went too far for some, and the secretary of the Social Democratic party, V. Leskinen, openly attacked the government and threatened the eventual withdrawal of his party from the cabinet. The government was concerned on the other hand with the anti-Russian attitude of some newspapers and the prime minister warned them that they might be banned unless they could take a "correct and matter-of-fact attitude" toward the U.S.S.R. On Nov. 21 Gen. Ilmari Karhu, chief of the general staff, was arrested by the state police for hiding weapons; his trial and that of his colleagues already in custody could take place only after special legislation was passed.

Economic conditions were as strained as political affairs. The reparations burden weighed heavily, but little had been done to ease it, despite an appeal in Oct. by Herbert Hoover, the obvious wishes of many non-Finnish peoples and continued direct negotiations between Finland and the U.S.S.R. Only on Dec. 31 was it announced that the soviet union had promised Finland the use of transit facilities through Porkkala and the Saima canal. In December, Finland was seeking an additional loan in the United States.

On Nov. 5 the government won a vote of confidence, 93 to 72.

Defense.—Finland is permitted to train 34,000 soldiers per year, and there was evidence that the Russians were making efforts to see that this corps be indoctrinated with sympathy for the U.S.S.R.

The main airport of Helsinki, Malm, was returned to Finnish control on Dec. 30.

Finance.—Current revenue of the state in 1945 began to approach ex-

FINNISH COMMUNISTS marching through the streets of Helsinki to the parliament building in 1946, where they demanded more effective removal of collaborators from official positions

penditures. The foreign debt of \$177,400,000 was not considered excessive (though the figure of Dec. 1939 was only \$12,100,000), and economic reconstruction would demand still further increase in the debt. Savings were decreasing and credit demands were high.

Total public debt on Aug. 31, 1946, was 99,436,000,000 marks (75% internal and 25% foreign), as compared with a debt on Dec. 31, 1941, of 27,493,000,000 marks. Bank deposits were up from 8,281,000,000 marks in Jan. 1945 to 17,286,000,000 marks on Aug. 31, 1946. Notes in circulation were up from 9,442,000,000 marks in Jan. 1943 to 19,076,000,000 marks in Aug. 1946. The rate of exchange on New York, which was 49.35 marks to the dollar on Dec. 31, 1939, was kept from Dec. 31, 1945, through Sept. 30, 1946, at 136 marks to the dollar.

The progress of inflation was slowed down in 1946, but it was still there; the cost-of-living index, with Aug. 1938 to July 1939 as 100, had risen 49% in 1945 and 6.6% in the period May to Aug. 1946 to stand at a peak of 466.

Trade and Communication.—Imports and exports expanded considerably as indicated by the comparative statistics below:

	Imports	Exports
Jan.-Aug. 1945	3,181,000,000 marks	1,115,000,000 marks
Jan.-Aug. 1946	14,849,000,000 marks	11,967,000,000 marks

More than 10,700,000,000 marks of the 1946 export figure was in wood, pulp, paper, etc. In addition to this "free trade" reparation deliveries amounted in the same period to 4,645,000,000 marks and restitution goods to 655,000,000 marks.

Finland recovered most of the ships held in Germany, the United States and other countries during the war; it also bought 24 tugboats from the United States, 3 tank vessels from England, and 2 from the Netherlands. It built in 1946 four steamships, three motorships and some smaller vessels. An increase of 30,000 gross registered tons was in service by Sept., giving Finland 513 vessels of a total of 290,445 gross registered tons. Goods transported on the state railways was steadily up, to 1,363,000 tons in July 1946.

Manufactures.—Industry was rapidly expanding. As compared with 1935=100, the index for the first half of 1945 was 61 and for the first half of 1946 was 81. Home market industry was up 30% over 1945, and in special lines the figures were: sawn timber up 7%, cellulose up 50%, plywood up 100%, pulp up 40%, paper up 80%. The greatest checks to further progress were the lack of foreign valuta and the short supply of labour.

Fire Insurance: see INSURANCE.

Fires and Fire Losses. The losses by fire, including lightning, in the United States as compiled by the National Board of Fire Underwriters for 1946 amounted to \$561,487,000. This compared with \$455,329,000 for 1945 and \$423,538,000 for 1944. The losses by

GUESTS descending a fire escape of the La Salle hotel in Chicago during the disastrous fire on June 5, 1946, in which 61 persons lost their lives

fire in 1946 were nearly approached by the losses in 1926 when they reached \$561,000,000 plus.

No outstanding fires were the occasion of this increase. The fires that brought attention were those primarily in hotels where there was a very large loss of life, particularly the one in Atlanta, Ga., where the loss of life was the largest that ever occurred in a hotel fire. This condition focused attention on the condition of properties where lives might be involved in a fire and remedial measures were at once instituted.

It should be emphasized that the increase in the losses by fire was in a measure the result of the higher prices of properties. The same number of fires in 1946 would naturally have brought a larger property loss than in previous years. (See also DISASTERS.) (E. R. H.)

Fisher, Geoffrey Francis (1887–), 99th archbishop of Canterbury (according to G. W. Searle, *Anglo-Saxon Bishops, Kings and Nobles*, 1899), primate of all England, is the youngest son of the Rev. H. Fisher, rector of Higham-on-the-Hill, Nuneaton. He was educated at Marlborough, Exeter college, Oxford, and Wells Theological college. He was assistant master at Marlborough (1911), and was ordained deacon (1912) and priest (1913) at Salisbury. In 1914 he became headmaster of Repton school in Derbyshire. In 1917 he married Rosamond Chevallier, granddaughter of Dr. S. A. Pears, formerly headmaster of Repton. In 1932 he was consecrated bishop of Chester, and in 1939 was translated to London, where his administrative ability left a great impression, particularly in the City. On April 19, 1945, he was enthroned as archbishop of Canterbury, in succession to Dr. William Temple. He played a leading part in church Assembly legislation, including the Diocesan Reorganization measure (1941) and the Church Commission measure (1946). In 1946 he attended the World Council of Churches at Geneva, and presided at the British Council of Churches in London. He also visited Canada and the United States. (A. J. MAC.)

Fisheries. For the fisheries of the world, the year 1946 was a period of readjustment after the devastation wrought by World War II. Throughout much of Asia and Europe, fishing fleets had been destroyed, harbours and shore plants wrecked and normal channels of distribution and marketing disrupted. All the affected countries made strong efforts during the year to rebuild their fleets and restore shore facilities for fishing with the result that world production probably was not far below normal (about 37,000,000,000 lb.) although means of distributing the catch remained far from adequate.

In the United States, the yield of the fisheries in 1946 was approximately 4,000,000,000 lb., according to figures released by the fish and wildlife service of the U.S. department of the interior at the end of the year. Although this yield was close to the peacetime average (4,400,000,000 lb.) the service characterized the year as one "marked by extremes of success or failure almost without parallel in the history of the fisheries." The major fisheries, almost without exception, experienced either extraordinarily successful or disastrously poor years. Rosefish on the Atlantic coast and tuna on the Pacific surpassed all previous production records. The total pack of salmon in Alaska and the Pacific coast states was the smallest after 1927. The menhaden catch was the largest on record; the pilchard catch one of the smallest.

In terms of pounds landed, the leading U.S. fisheries in 1946

were those for menhaden, pilchard, salmon, tuna, Alaska herring and rosefish, in the order named. These six fisheries were responsible for more than half of the total yield.

In an unexpected reversal of roles, the little known menhaden became the principal item among the products of the U.S. fisheries, while the pilchard, which had supported the leading fishery in the country for 12 years, declined to second place. The catch of menhaden rose to 900,000,000 lb., from 756,000,000 lb. in 1945 and 686,000,000 lb. in 1944. This large member of the herring family occurs in tremendous numbers along the Atlantic coast and has supported a fishery from colonial times. The entire catch is converted into fish meal and oil. Centres of the menhaden industry in 1946 were Lewes, Del., Reedville, Va., Port Monmouth, N.J., and Beaufort and Morehead City, N.C.

After maintaining an average production of about 1,000,000,000 lb. during the decade 1936-45, the pilchard fishery, which is centred on the California coast, landed only 491,000,000 lb. in 1946. This was approximately half the quantity landed the previous year, when some indications of impending scarcity became evident. Throughout 1946 pilchards were notably scarce in the waters of northern and central California, ordinarily the scene of a busy fishery. Most of the pilchard fleets operating out of San Francisco and Monterey were forced to turn to other types of fishing or to move to other ports. Almost the entire catch of pilchards during the fall season was made off southern California, where the fish were present in normal abundance.

Salmon was another Pacific coast fishery that fell far below normal yields. The pack of 4,396,684 cases by canneries in the U.S. and Alaska was the smallest after 1927. In 1945, also a poor year, 4,900,471 cases of salmon were packed.

Although the northern albacore fishery was almost a complete failure, tuna landings in California were so large that this industry set a new production record. The pack during the first 11 months of 1946 was within a few thousand cases of 1945's record pack of 4,237,000 cases; the year's total was therefore certain to reach a considerably higher figure.

Alaska herring, which along with menhaden and pilchard supplies the raw materials for the fish meal and fish oil industries, continued the increase in productivity begun several years before. From 113,000,000 lb. in 1944 and 120,000,000 lb. in 1945, the catch of herring in the territory rose to approximately 190,000,000 lb. in 1946.

Although the New England fisheries as a whole were slightly less productive in 1946 than in 1945, the major species in the catch, rosefish, made a gain of 38% compared with the previous year. From a little used and almost unknown species a decade before, rosefish, yielding 180,000,000 lb. in 1946, became one of the leading fishery products in the U.S. Landings of all species combined at the principal New England ports totalled 640,000,000 lb., compared with 670,000,000 in 1945.

The pack of mackerel by California canneries had reached 423,703 cases by the end of November, a slight decline from the 490,736 cases packed during the same period in 1945.

The Maine sardine industry, on the other hand, enjoyed a somewhat more successful season than the previous year in spite of a discouragingly small early season pack. The 1946 pack totalled approximately 2,800,000 cases, compared with 2,509,551 cases in 1945.

The leading fishing ports in the U.S. in 1946, in weight of fish landed, were San Pedro, Calif.; Lewes, Del.; Gloucester and Boston, Mass.; and Reedville, Va. In terms of the value of the landings San Pedro again held first place, followed by San Diego, Boston, New Bedford and Gloucester, in the order named.

San Pedro, which also held the title of leading U.S. fishing

port in 1944 and 1945, received most of the pilchards and mackerel landed on the Pacific coast and nearly half of the tuna. Landings totalled approximately 475,000,000 lb., with a value to fishermen estimated at \$17,000,000. Lewes rose from sixth place in 1945 to second in 1946 because of the tremendous increase in the landings of menhaden—from 175,000,000 lb. in 1945 to 276,000,000 lb. in 1946. Gloucester, among the three leading ports in the U.S. for two years in succession, received 218,000,000 lb. of which about 60% was rosefish. Landings at Boston amounted to 159,000,000 lb., consisting chiefly of miscellaneous ground fish like cod, haddock, pollock and flounders. Although Boston's landings were smaller than Gloucester's, their total value was greater: \$13,000,000 compared with \$11,200,000. Reedville received approximately 147,000,000 lb. of menhaden, its sole fishery product, compared with 80,000,000 lb. in 1945.

Although San Diego, with about 125,000,000 lb., ranked below the first five ports in volume of landings, the high value of the fish brought into this port (principally tuna) entitled it to second place in terms of value. The value of all fish landed there in 1946 was about \$15,000,000.

Fish landed at New Bedford—haddock, flounders and other species for the fresh fish markets—were valued at \$11,800,000. Compared with 1945, the volume of landings at this port declined about 10%, totalling 92,000,000 lb.

Production of fish meal during the first 11 months of 1946 by firms which normally account for 94% of the output of this industry was 162,882 tons, compared with 173,559 tons during a comparable period of 1945, while the production of fish oils amounted to 17,941,196 gal., or a 20% decline below the 11-month yield in 1945, according to figures reported by the fish and wildlife service. Because of the failure of the pilchard fishery in the Monterey and San Francisco districts, the peak production of fish oil during 1946 occurred in July. Normally the month of peak production is September or October. The menhaden fishery was the source of more than half the meal and oil produced during the year.

The fish and wildlife service also reported a considerable increase in the size of the U.S. fishing fleet during 1946, with more than 1,000 vessels documented during the year, compared with 739 the previous year. About 85% of these boats had been newly constructed in 1945 or 1946. Since the fishing fleet normally loses about 275 boats a year through obsolescence or marine disaster, the addition of a thousand vessels indicated a sharp increase in the productive capacity of the fleet.

In the field of conservation, the U.S. and Canada signed a treaty on April 2, 1946, to provide for the development, protection and conservation of the Great Lakes fisheries as a natural resource of mutual interest to the two countries. During November an international whaling conference was held in Washington, D.C., to develop more efficient and flexible means of regulating the whale fisheries of the world. (R. L. CN.)

Other Countries.—The main centres of civilization are in the temperate latitudes, and the greatest, most highly developed fishing industries are based upon the comparatively shallow and chemically rich temperate regions of the northern Atlantic and Pacific oceans, the richest known fishing grounds being those of the Atlantic slope of Europe, including the North sea, which is probably the most prolific of the greatest variety of fishes in the world.

A review of the fishing industry from 1914 onward explains the conditions and developments of 1946. Before 1914 the rapid development of the technique of fishing, especially the introduction of the steam trawler and the use of increasingly efficient fishing gears, had brought about serious impoverishment of the stocks of fish, which was reflected in a decline of the bulk of the catches and a steadily increasing proportion in

them of small immature fish. Paradoxically, modern warfare, so massively destructive on land, exercises a conservative influence over life in the sea. Mines and other dangers limit fishing operations to narrowly prescribed areas, and all the most efficient fishing vessels, being invaluable as naval auxiliaries, are requisitioned. During World War I, therefore, extensive fishing grounds enjoyed the immunity of sanctuaries, and the resumption of fishing after the war revealed a great recuperation of the fish stocks. The accumulated stocks were recklessly exploited and in 1939 conditions were even worse than in 1914. The protective measures embodied in the Fisheries convention of 1937 had come too late, or at least, had not had time to make their effect felt. But again war gave a respite to the overfished stocks, which, as estimated by catches in 1946, had increased to unparalleled abundance.

The governments of the countries chiefly concerned took steps in 1946 to prevent a repetition of the insane scramble for fish which followed World War I. Their delegates, accompanied by observers from the International Council for the Exploration of the Sea, met in London in the spring and agreed on certain measures for making the Fisheries convention of 1937 more effective. The chief points of agreement were that the meshes of fishing nets for bottom fish should be further enlarged and the size limits for market fish appropriately increased. As to other proposals involving global reduction of fishing tonnage, limitation of the time spent at sea, closed seasons for certain kinds of fish and the establishment of sanctuaries, particularly in the Faxe bay halibut nursery off Iceland, the conference did not reach agreement. It strongly recommended, however, the appointment of a standing advisory committee to study, and, within a year, to make proposals for the most suitable forms of regulation for the prevention of overfishing, in consultation with the International Council for the Exploration of the Sea. A largely attended meeting of this council, whose headquarters were in Copenhagen, was held in Aug. 1946 in Stockholm on the invitation of the Swedish government, and during the meeting these proposals were discussed and broadly approved.

Little more than half of the prewar number and tonnage of British trawlers had returned to fishing in 1946, and it is probable that other countries fishing these waters, especially Germany, were similarly short of vessels, but, at the same time, good supplies of fish were being landed.

The case of the great herring fisheries was very different from that of the bottom or demersal fish fisheries. The herrings had never shown signs of overfishing. The prosperity of the industry depended on the overseas market for pickled herrings. A great effort was made in 1946 to pickle the largest quantity possible to provide food for Germany. The target aimed at was 500,000 bbl., about 2,000,000 bbl. less than the average of the years 1911-13, and some 250,000 less than that of the years between the two world wars, when the great Russian market had been lost. The chief limiting factor in the 1946 output was lack of barrels.

The fisheries of the northwestern Pacific were exploited mainly by the Japanese, who had developed a considerable fish-canning industry. Little was known of the extent of fishing in those regions in 1946 but relaxation of fishing during World War II would have allowed stocks to increase.

The fisheries of the Mediterranean were not, in the past, of any great significance. The coastal shelves were not extensive and, apart from the tunny fisheries, there was little fishing of importance except along the coasts of North Africa and the Levant, Cyprus and some of the other islands.

There were great possibilities of development all along the west coast of Africa and at the Cape. In South African waters

good progress had been made before the war; but both here and on other parts of the African coast the produce of the fisheries was used mainly for local consumption, the waters being so remote from the markets of Europe that only by means of hard brine-freezing could fish be transported to those markets in fit condition for human consumption, or, at least, in such condition as to be able to compete economically with local supplies.

Meanwhile a conference on whaling sat at Washington, D.C., between Nov. and Dec. 1946. It was attended by delegates from 15 nations and observers from 4 others. The purpose of the conference was to codify, with or without amendment the existing agreements and protocols. If effect were given to the recommendations of the conference in this respect the existing agreements would be confirmed in codified form substantially as they stood, modified only to make their provisions more precise and effective. An important new provision suggested by the conference was the appointment of a permanent whaling commission with power to amend the agreements. The terms of any convention that might result from the conference would, in due course, be published by the U.S. state department. (See also MARINE BIOLOGY.) (H. G. M.)

Floods and Flood Control. Exclusive of the large projects previously authorized for the alluvial valley of the Mississippi river and the Sacramento river, Calif., construction on the federal program for general flood control was begun in 1937 after the first funds for that purpose were appropriated by congress. By the end of June 1946, 50 reservoirs and 135 local protection projects were in operation throughout the United States. In addition to previous authorizations, congress, in the Flood Control act approved July 24, 1946, authorized expenditures by the war department amounting to \$772,000,000 for approximately 123 additional flood control and multiple-purpose projects. With the passage of the 1946 Flood Control act, Congress had approved authorizations totalling \$2,452,400,000 for the construction of about 770 reservoirs and local protection projects. In the period from 1937 through July 30, 1946, funds totalling \$835,421,900 were appropriated for flood control general purpose of which \$769,472,000 was for the construction and detailed planning of projects and the remaining \$65,949,900 was for maintenance of completed projects, surveys and miscellaneous items.

The authorized projects collectively constitute a comprehensive co-ordinated plan for the development of the river basins of the nation to provide economical flood protection and allied benefits for centres of industry and population, millions of acres of rich, agricultural land and vital lines of communication. In addition to their use for flood control, many of the reservoirs provide favourable possibilities for the development of hydroelectric power, stream flow regulation, water conservation, recreation and other water uses.

A number of projects were completed during 1946, including the Indian Rock dam in Pennsylvania and local protection works at East Peoria, Ill., Sauvie Island, Ore., and in the Skamokawa creek area, Wash.

Subsequent to the cessation of hostilities in the Pacific, congress appropriated \$84,659,000 in the First Deficiency act for the fiscal year 1946, and \$138,901,000 in the war department Civil Appropriation act for the fiscal year 1947, for continuing work on flood control projects deferred during the war emergency and for the initiation of new, urgently needed projects.

During the year, work was resumed on the flood protection

NIGHT VIEW OF MARKET SQUARE in Williamsport, Pa., inundated by flood waters of the Susquehanna river during the spring of 1946

projects in river basins throughout the nation which had been stopped during the war in order to conserve equipment, materials and manpower. These projects include the Lisle and Elmira, N.Y., local protection projects in the headwaters of the Susquehanna river; the Plymouth, Wilkes-Barre, Williamsport and York, Pa., local protection works along the middle and lower Susquehanna river; the Wallace lake dam and reservoir in the Red river basin, Louisiana; the John Martin dam and reservoir, Colorado, the Blue Mountain dam and reservoir, Arkansas, and the Canton dam and reservoir, Oklahoma, all in the Arkansas river basin; Clearwater dam and reservoir, Missouri, in the White river basin; local protection at the Kansas City and the Kanopolis dam and reservoir on the Smoky Hill river in Kansas, both in the Missouri river basin; local protection works at Cincinnati and Massillon, O., the Cache river diversion unit at Mounds and Mound City, Ill., and the Dale Hollow and Center Hill dam and reservoir projects on tributaries of the Cumberland river, all in the Ohio river basin; Los Angeles river channel improvement and the Santa Fe dam, both in the Los Angeles county drainage area, California.

Projects previously authorized and for which plans and specifications were prepared during World War II were initiated at the following localities: local protection at Nashua, N.H., in the Merrimack river basin; the Union Village dam and reservoir on the Ompompanoosuc river in Vermont; local protection works at Whitney Point, N.Y., and the Almond dam and reservoir, both units of the project for the headwaters of the Susquehanna river; Sunbury, Pa., in the Susquehanna river watershed; the Clark-Hill dam and reservoir project in the Savannah river basin, Georgia, and the Allatoona dam and reservoir in the Coosa river basin, Georgia; the Narrows dam and reservoir on the Little Missouri river, Arkansas; local protection for Shreveport, La., in the Red river basin; Hulah dam and reservoir in Oklahoma, Fort Gibson dam and reservoir, Oklahoma, Fall River dam and reservoir, Kansas, Wister dam and reservoir, Oklahoma, all in the Arkansas river basin; the Bull Shoals dam and reservoir, Arkansas, in the White river basin; Harlan County dam and reservoir on the Republican river, Nebraska, Cherry Creek dam and reservoir for the protection of Denver, Colo., local protection works at Kensler's Bend, Schuyler and Omaha, Neb., and Council Bluffs, Ia., and the main Missouri river dams at the Fort Randall and Garrison sites, all in the Missouri river basin; Delaware dam and reservoir, Ohio; Dewey dam and reservoir, Kentucky and the Conemaugh dam and reservoir project, Pennsylvania, local protection works at Newport, Ky., Punxsutawney, Pa., Parkersburg and Elkins, W.Va., all in the Ohio river

basin; and the Dorena dam and reservoir in the Willamette river basin, Oregon.

The separately authorized project for the Sacramento river and its tributaries, California, was to provide flood protection for cities and towns, fertile agricultural lands, and railway and highway facilities of great importance to the economy of the western United States. Work was continued on this project throughout 1946, including levee construction along the Sacramento, American and Feather rivers, and the clearing of obstructions in Butte slough and the Sutter by-passes.

Although the year 1946 was not a serious flood year from the national viewpoint, there were many flash floods which caused very serious damage to relatively small areas. The more important floods during the year included a very serious flood which struck the Willamette river basin in late Dec. 1945 and early Jan. 1946, and caused damages estimated at \$6,000,000. The reduction in damages credited to the operation of the completed Cottage Grove and Fern Ridge reservoirs was estimated at \$1,200,000. The Yazoo river had two floods in the spring of 1946 which closely approached the all-time record for that stream. The end of May saw the north and west branches of the Susquehanna river at near record flood stage. The October flood of the North Canadian river in Oklahoma inundated portions of Oklahoma City as well as other urban and agricultural land along that stream and its tributaries. (R. A. W.R.)

Great Britain.—The year was notable for the occurrence of frequent, widespread and severe floods. In March there was widespread flooding in the midlands. Stafford suffered severely. There was severe flooding in other parts of the midlands, in Wales and in the Severn valley. The midlands had severe floods again in mid-September. In the Peak valley the flood was one of the worst ever experienced.

There was some flooding in the west between Aug. 10 and Aug. 13, and streets in Bristol and Weston-super-Mare were under water. Floods in southern Ireland in the same month were caused by a rainfall which included from two and a half to three inches in 24 hours, a record for that region. In Lancashire the overflowing in September of the River Orwell, caused very serious flooding and the water rose at one point to 24 ft. above its normal level. A number of houses in Salford collapsed and many households were rescued by boats from upper floors and roofs. In Manchester the flooding of streets and riverside factories was serious and much damage was done.

In the middle of November continuous rain caused much flooding in the midlands. The River Tame overflowed and flooded a part of Birmingham. There were floods over many areas in south Wales, Devon and Dorset. Floods which were at their worst on Dec. 1 caused much damage in England and Wales. The River Thames rose about 4 ft. 8 in. above normal, the highest level after 1943, and the Thames valley was flooded in many places.

No important works of flood control were in progress in Great Britain in 1946, nor were reports of any such works reported from overseas. The need for the early adoption of a policy of flood and flow control of British rivers was, however, widely recognized. It was hoped that schemes for the rivers Severn and Thames, long since prepared, would be adopted by the authorities. The scheme for the Severn involved the creation, by means of dams, of five reservoirs, having a total capacity of 47,000,000,000 gal., for the control of floods. For the Thames six reservoirs were planned, having a total capacity of 16,500,000,000 gal. for the control

of floods, and four reservoirs, having a total capacity of 39,730,000,000 gal., for control of floods and assurance of London's water supply.

Other Countries.—Melbourne, Australia, was caught between two cyclonic centres in January. Heavy rain lasted for more than 24 hours and floods swept through the northern suburbs. Early in March a flood in the valley of the River Burdekin, north Queensland, isolated the township of Hone Hill for some days. At least six persons were drowned and many rendered homeless by floods in the western districts of Victoria and in Tasmania. Hundreds of sheep and cattle were drowned, crops were destroyed and roads and railways damaged.

Floods of July isolated the town of Silchar in eastern Assam. In the Chittagong area nearly 600,000 persons were seriously affected by floods, some villages being 15 ft. deep in water.

In August, 300,000 ac. of cultivated land in upper Egypt had to be flooded, in order to avert the destruction of crops over 4,000,000 ac. Floods in Palestine in January drowned 22 people and rendered many homeless. (See also DAMS; FORESTS; IRRIGATION; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION; TENNESSEE VALLEY AUTHORITY.)

(R. A. Rs.)

Florida. The extreme southeastern state of the United States, called the "Peninsula state" because of its peculiar outline. Its coast line, not taking into account its numerous bays and indentations, is greater than that of any other state, extending 472 mi. along the Atlantic and 674 mi. along the Gulf of Mexico. Area, 58,560 sq.mi., of which 4,298 sq.mi. are water surface; pop. (1940) 1,897,414, of which 1,045,791 were urban and 851,623 were rural; 1,384,365 white and 513,049 Negroes. Only about 60,000 were foreign-born. Capital, Tallahassee (16,240 in 1940). The larger cities are Jacksonville (173,065), Miami (172,172) and Tampa (108,391). By the state census (1945) Florida had a population of 2,249,649. Population figures for the three larger cities, Jacksonville, Miami and Tampa, were 206,442, 192,122 and 124,476 respectively.

History.—The state elective administrative officers in 1946, whose terms were to expire in Jan. 1949, were as follows: Mil-lard Caldwell, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney-general; C. M. Gay, comptroller; J. Edwin Larson, state treasurer; Colin English, superintendent of public instruction and Nathan Mayo, commissioner of agriculture.

Education.—The biennial report of the state superintendent of public instruction, 1942-44, the latest report available at the close of 1946, showed enrolment in the public schools for 1943-44 through grade 12 as follows: white 288,071; Negro 101,605; total 389,676. There were 1,766 elementary and 674 secondary public schools in the state, with instructional staffs totalling 13,305 teachers, of whom 9,993 taught in the schools for whites and 3,312 in the schools for Negroes.

Social Insurance and Assistance, Public Welfare and Related Programs.—Florida disbursed for state welfare \$19,267,587.40 in 1945-46. From grants by the federal government, the state received in 1945-46 for old-age pensions \$7,942,746.95; for dependent children \$1,346,673.64; and for pensions for the blind \$440,769.85. Disbursements for old-age assistance were \$15,282,356.50; for dependent children \$2,538,856.50; and for the blind \$853,345.50. The unemployment benefit receipts were \$5,025,890.34, with benefit disbursements of \$4,596,504.

Florida has no state penitentiary, but maintains a prison farm at Raiford, an Industrial School for Boys at Marianna and an Industrial School for Girls at Ocala. The appropriation for these institutions for 1945-46 carried the sums of \$630,600, \$220,880 and \$105,600 respectively. The state also supports a state hospital for the insane at Chattahoochee, the Florida Farm colony for the feeble minded at Gainesville and the Florida School for the Deaf and Blind at St. Augustine.

Communications.—The total highway mileage in the state in 1946, exclusive of roads built for military purposes, was about 49,184 mi., of which approximately 22,633 mi. were paved or hard-surfaced. Disbursements for the year ending Dec. 30, 1946, for maintenance and construction, amounted to \$18,315,472.44.

The state road department's tentative budget for 1947 for construction was \$49,813,431.10 plus \$3,473,499.88 for maintenance and other departmental costs. Florida in 1946 had about 6,000 mi. of railroads.

Banking and Finance.—On June 30, 1946, there was a total balance in the treasury of \$67,153,041.81. The state is constitutionally forbidden to incur a debt by borrowing except to put down rebellion or repel invasion. The constitution also prohibits the legislature from levying an income tax, forbids any state ad valorem tax on real estate, and exempts homesteads from taxation by local taxing units up to the value of \$5,000.

On June 30, 1946, there were within the state 60 national banks with deposits amounting to \$1,326,803,000 and 112 state banks and trust companies with deposits of \$499,392,000, representing total deposits of \$1,826,195,000, a gain in deposits of \$282,884,000 in the fiscal year.

Agriculture.—In 1940 the U.S. census showed that there were 62,248 farms with a total acreage of 8,337,708 ac. of which 1,751,275 were in crops; 462,248 were idle (fallow); 2,643,065 were in pasture; 1,649,960 were in farm woodland and the rest mainly in fruit.

Principal Agricultural Products of Florida, 1946 and 1945

Crop	1946	1945
Corn, bu.	6,910,000	7,755,000
Tobacco, lb.	22,251,000	20,082,000
Potatoes, bu.	6,249,000	5,285,000
Sugar cane, short tons.	1,156,000	1,042,000

The citrus production for the season 1945-46 and the estimates for 1946-47 respectively were as follows: oranges (including tangerines) 54,000,000 boxes and 67,200,000; grapefruit 32,000,000 boxes and 34,500,000.

On Jan. 1, 1946, the livestock resources of the state were as follows: 1,065,000 beef cattle and calves; 140,000 milch cows; 536,000 swine; 22,000 sheep; 21,000 horses; and 35,000 mules.

Manufacturing.—The more important manufactures of the state in 1946 were lumber, wood pulp, naval stores (turpentine and rosin) and cigars. There was a great expansion of shipbuilding after 1940, much of it in connection with the war effort.

The cigars manufactured in Florida are valued at around \$21,000,000 annually. Tampa and Jacksonville are the leading cities in this industry.

Florida's lumber production, mainly yellow pine and cypress, in 1945 was 465,000,000 bd.ft. The total estimated value of primary wood products for Florida in 1946 was more than \$100,000,000. Tung oil and the manufacture of paper and paper board were also important industries.

In 1939, according to the U.S. census figures (1940), the state had 2,083 manufacturing establishments, paying \$37,823,204 to 52,728 workers and producing \$241,238,534 worth of goods.

Mineral Production.—Florida had only limited resources in minerals, but had large and rich deposits of phosphates, lime and limestone and less extensive, though highly valuable, deposits of kaolin and fuller's earth. The estimated value of the state's mineral production in 1946 was about \$25,000,000.

(A. N. P.; J. M. L.)

Flour. The spring of 1946 saw flour millers adjusting their operations to conform to federal emergency measures plus the restrictions imposed by the U.S. Famine Emergency commission in co-operation with the United Nations Relief and Rehabilitation administration.

The major factors affecting grain available for milling during the year were: (1) export of at least 250,000,000 bu. of wheat to famine areas, (2) reluctance of farmers to market grain in view of probable higher grain prices and general inflationary market conditions, (3) governmental efforts to maintain adequate movement of grain for export and for domestic milling.

Wheat Flour Conservation Measures.—In order to meet the minimum export quota for 1946 of 250,000,000 bu. announced by Secretary of Agriculture Clinton P. Anderson, the following limitations on domestic wheat consumption were made effective early in the year:

- (1) OPA Supplementary regulation 14B (revised), effective, March 15, 1946, permitting reduction of the net weights of bread and rolls not to exceed 10% without corresponding price reductions.
- (2) Regulations limiting millers to 87.5% of the 1945 production of flour for domestic use.
- (3) U.S. department of agriculture ruling requiring the extraction of 80% flour from wheat, instead of the usual 68%-72%.
- (4) Regulations limiting brewers to 70% as much grain to manufacture beer for 1946 as in 1945.
- (5) Rules limiting distilleries to only three days (24 hours) operations for a month, instead of unlimited operations formerly permitted.
- (6) War Food order 144, making mandatory the reduction of flour millers' grind inventory from 45 to 30 days.

The net effects of these official orders and regulations were: (1) to curtail flour milling operations for a period of several weeks; (2) to limit and decrease the consumption of flour by the baking industry as a whole; (3) to make immediately available surplus wheat and flour for export.

The above program of grain conservation for export was additionally implemented by the department of agriculture's wheat bonus plan whereby all farmers would receive 30 cents per bushel above existing market prices for all wheat sold prior to May 25, 1946. Since much of this wheat could not be ground for domestic uses, it became immediately available for export to world famine areas, chiefly central and southern Europe, parts of France and Great Britain, China and India.

Voluntary co-operation by bakers with the government and the milling industry was manifest by the American Retail Bakers association, which on April 26, 1946, in convention at Chicago, agreed to a program of materials curtailment designed to cut white flour consumption by 40%.

Further recommendations for wheat conservation by Pres. Truman's Famine Emergency committee included the following:

1. To reduce by at least 10% the weight of all bakery products, especially bread.
2. To feature breads of smaller sizes.
3. To slice bread thinner.
4. To offer partial sized loaves, such as $\frac{1}{2}$ or $\frac{3}{4}$, to help prevent waste.
5. To save flour, as well as other ingredients, by avoiding spoilage and waste.
6. To serve corn or buckwheat cakes in place of wheat cakes.
7. To bake oatmeal bread, cakes, and cookies in place of wheat products.
8. To limit the number of crackers, etc., served with soups.
9. To eliminate three-layer cakes.
10. To use alternates for wheat cereal.

Starting Sept. 1, 1946, by order of Secretary of Agriculture Anderson, War Food order 144 was withdrawn, thus permitting the flour milling industry to return to normal operating conditions with respect to flour extraction. Limitations on U.S. flour production to 85% of the 1945 grind continued in effect.

Crops, Carry-over and Prices.—Fortunately for U.S. millers, as well as for the famine stricken areas of the world, the U.S. wheat crop for 1946 reached an all-time high of approximately 1,150,000,000 bu., about 9,000,000 greater than the 1945 record crop, and about 42,000,000 more than the official forecast. Wheat carry-over from the 1945 crop continued to drop steadily because of record flour production for that year combined with export shipments. The U.S. department of agriculture estimated that the wheat carry-over as of July 1, 1946, would drop to between 80,000,000 and 100,000,000 bu., said to be the smallest after the 83,000,000 bu. of 1937.

British Milling.—British millers and consumers of flour were much more severely harassed by governmental orders, resulting from the exigencies of war, than were millers in the U.S. or Canada.

Flour or wheatmeal milled in Great Britain after May 1946 was the 90% extraction product, a national wheatmeal containing 5% more branny substance than the 85% product initially milled in April 1942. The extraction rates from the outbreak of World War II varied both down and up from this 85% level. Starting with the prewar figure of approximately 72%, in April 1942 this was raised to 85%, then lowered, at first to 82½% in Oct. 1944 and later to 80% in Jan. 1945. An increase back to 82½% was ordered in Feb. 1946, up to 85% in March, and finally to the high of 90% in May 1946.

Nutritional Studies on Wheat Products.—Investigations of diets containing high proportion of wheat protein—wheat flour and breads—commanded considerable attention in the field of nutritional research. South

FINE MESH SILK SCREENS for sifting white flour being installed in a Minneapolis flour mill in late Aug. 1946. They replaced coarser screens which sifted "gray" flour during the wheat shortage

African investigators A. R. P. Walker, *et al.*, at the instigation of the National Nutrition Council of South Africa, conducted extensive researches to determine the effect of breads made with 95% extraction wheatmeal. Studies on the protein requirements of adults included diets of which, it was said, 50% of the nitrogen was supplied by white bread (containing no skim milk solids) and a total of 62% was supplied by cereal products.

Milling Statistics.—U.S. production of regular grind wheat flour in 1945 was 279,400,000 sacks (100 lb. each), based on census figures from mills producing 97% of the total U.S. grind. This represented an increase of 9% above the 255,200,000 cwt. production of 1944 and 22% above the 218,300,000 cwt. reported in the census of manufacturers for 1939.

Wheat ground in the production of white flour in 1945 was estimated at 652,000,000 bu., compared with 592,000,000 in 1944 and 510,000,000 in 1939. Thirty-three mills, or 3% of the total, accounted for 35% of

Table I.—Price Increases in the U.S. for Wheat During World War II

Year	Price to Farmers per bushel	Price Changes	
		Over 1940 per cent	Over previous per cent
1940	\$0.69
1941	0.68	1.4 decrease	1.4 decrease
1942	0.945	36.9 increase	39.0 increase
1943	1.10	59.5 "	16.4 "
1944	1.36	97.1 "	23.6 "
1945	1.41	104.3 "	3.7 "
1946	1.74*	152.2 "	23.4 "

*Estimated Sept. 1, 1946.

Table II.—U.S. Wheat Flour Production for 1945 by Type or Use

Item	No. of companies	Production in thousands of sacks	Per cent of total
Family flour	906	69,251	24.5
All purpose		65,154	23.1
Prepared mixes including cake and pastry flours	44	4,097	1.4
Commercial flour, excepting export	181,752	64.4
Bakery Flour	232	165,920	58.8
Blender Flour and Farina	84	5,199	1.8
Semolina and Durum Flour	11	10,633	3.5
Export Flour	106	18,312	6.5
Industrial Flours, excepting direct exports	52	12,959	4.6
Total	931	282,278	100.0

**Table III.—Average U.S. Retail Prices of Flour and Flour Products,
Aug. 14, 1945**

(Compiled by U.S. Bureau of Labor Statistics)

	in cents per pound					Annual Averages	
	Aug. 14 1945	July 17 1945	Aug. 15 1944	July 18 1944		* 1944	1943
Flour, wheat	6.4	6.4	6.5	6.5	-6.5	6.1	5.2
Bread, white	8.8	8.8	8.8	8.8	8.8	8.9	8.7
Bread, whole wheat	9.7	9.7	9.6	9.7	9.7	9.8	9.5
Bread, rye	9.9	9.9	9.9	9.9	9.9	10.0	9.7
Soda crackers	18.9	18.9	19.0	18.9	18.9	18.0	16.4

*Based on data from 51 U.S. cities prior to Feb. 16, 1945

the 1945 reported production of regular wheat flour. Mills with a maximum daily capacity of more than 1,600 sacks accounted for 84% of the total production in 1945, compared with 80% in 1940.

(See also BREAD AND BAKERY PRODUCTS.)

Fluorspar. The demand for steel during World War II led to increased requirements for fluorspar which were made even larger in the United States by other war uses. Hydrofluoric acid and its derivatives are used in the making of artificial cryolite, insecticides (DDT and aerosol bombs), refrigerating liquid (freon) and high octane gasoline. The important place which these products gained in the war program was expected to carry over to peacetime, and to lead to a demand for fluorspar above that of pre-war years. The development of the industry during the war years is outlined in the table.

Data of Fluorspar Industry in the U.S., 1939-45

(In thousands of short tons)

	1939	1940	1941	1942	1943	1944	1945
Shipments	182.8	233.6	320.7	360.3	406.0	413.8	324.0
Imports	16.3	11.9	7.5	2.2	43.8	87.2	103.1
Consumption	176.8	218.5	303.6	360.8	388.9	410.2	356.1
Iron and steel	127.3	160.1	214.7	250.4	241.4	238.0	204.7
Acid	26.3	35.7	56.0	81.6	113.6	129.6	109.3

The production rate declined appreciably in 1945 and continued low in 1946. Shipments in the first eight months of 1946 totalled 158,310 tons and consumption 185,105 tons. Imports declined heavily.

Production figures for other countries for 1944 (and 1945) were limited to the following, in short tons: Canada 6,924 (6,921), Mexico, exports 62,225 (55,392), Newfoundland 65,308 (54,940), Spain 56,242 (7,119). (G. A. Ro.)

Food and Drug Administration: see DRUGS AND DRUG TRAFFIC; FEDERAL SECURITY AGENCY.

Food Research. Scientists engaged in food research were able in 1946 to turn from war emergency programs to long-time objectives. Among these objectives were the definition of basic needs, the determination of food properties and the discovery of fundamental relationships between nutrition and economic conditions. Naturally, nutrition facts learned under war conditions came in handy. Millions of people in Europe and elsewhere subsisted or partly starved during the war on one-half to one-third as much food as the average U.S. citizen gets. Studies of nutrition under these conditions afforded ground work for important generalization.

Underfeeding affects nutrition in proportion to its degree and its duration. One of the first results, and one of the most easily measured, is loss of weight in adults and retarded growth in children. Monthly weighings by the U.S. army of more than 100,000 persons in occupied Germany and Austria, supplemented by more detailed measurements on a smaller sample, gave important evidence, which research workers combined subsequently with comparable data obtained under more normal conditions. They concluded that when diets provide fewer than 2,000 calories daily for a person for any length of time, the effects are very serious.

Adults lose weight and also lose the power to work effectively, children fail to grow normally and civil unrest appears, except possibly in the far east where people endure semistarvation fatalistically. Strangely, the investigations in Europe did not commonly reveal severe vitamin deficiencies. Nutritionists inferred the reduced caloric intake, with the associated lowered

rates of metabolism, had lowered the vitamin requirement. Nevertheless, observers reported rickets among groups of young children who had not had fish liver oil or some other source of vitamin D. Underfeeding also involved greater susceptibility to disease and higher death rates. It was not possible to estimate the lasting damage to health.

Nutritionists in the United States expressed concern as to the possible effect of high prices on nutrition. In the war years incomes generally sufficed to meet these higher prices. Many families indeed purchased more milk, eggs, meat, fruit and vegetables than before the war. Their greater food intake, along with the general enrichment of grain products with vitamins, lifted the nutrient value of the average diet to an unprecedented high level. Moreover, the average U.S. civilian in 1946 consumed no less than 15% more food in terms of calories than before the war. Nevertheless, certain groups were still not adequately fed, and the prospect that food prices might rise still further with incomes not keeping pace implied that many families with low incomes would have to change their buying patterns and include in their diets more of the lower-priced concentrated foods such as grain products, dry beans and peas and potatoes.

Accordingly, nutritionists drew attention to laboratory studies that showed the nutritive value of soybeans, peanuts, cottonseed, wheat germ and corn germ. Proteins in these foods have high nutritive value and very effectively eke out reduced supplies of the animal proteins. Plant proteins combine well with breadstuffs and cereals, often in such a way as apparently to increase the total nutrient value. Thus, the department of agriculture reported that adding 15 parts of soybean flour to 85 parts of wheat flour in bread used in feeding experiments with young rats increased the growth-promoting value five times. In these experiments wheat and corn germ proved superior. Wheat germ was highest in growth-promoting value and appeared to be the plant protein nearest to the proteins of meat, eggs and milk.

The department also carried on investigations to find out the vitamin A requirements of human beings. Scientists fed an experimental diet to volunteers. Meals given contained every vitamin the human body is known to need except vitamin A, which was almost completely absent. One early measurable effect of vitamin A deficiency is night blindness. Appearance of this condition indicated the subject had about used up his stored vitamin A. He then received enough in gradually increased doses to keep his vision normal in dim light. These experiments yielded data for estimating average daily minimum vitamin A requirements and also the relative importance of different sources. In the first experiments cod liver oil and carotene provided the measured amounts of vitamin A. Then the requirements were measured in terms of natural food, such as peas, spinach and carrots, parts of which are changed to vitamin A in the body. It appeared that the normal adult needs from 30 to 60% more carotene as found in vegetable foods than he does of the vitamin A found in animal foods.

A new aid for nutritionists and others engaged in planning diets or calculating the nutritive value of food supplies was the publication by the department of agriculture of *Tables of Food Composition in Terms of Eleven Nutrients*. The tables brought under one cover the composition of 275 common foods in terms of 11 nutrients.

The new publication gave average values for food energy, protein, fat, carbohydrate, vitamin A value, thiamine, riboflavin, niacin, ascorbic acid, water and refuse. The values given were derived from all available literature of nutrition research and from unpublished data from laboratories that had analyzed foods through arrangements with the National Research Council. In addition to foods believed to be most commonly used in the United States, the tables included many of the less common foods. All the values were stated in terms of a 100-gram edible portion and in terms of one pound as brought into the house for consumption.

Typical of studies on the nature of foods were investigations in the department on the nutritive value and the amino acid content of protein-rich foods of both plant and animal origin. It was discovered, for example, that the proteins of raw peanut meal have much higher biological values than commercial peanut meals. This suggested that the high temperatures used in the industrial preparation of peanut meals are injurious to their nutritive value and that corrective measures could improve the quality of this protein-rich food. It was found that heat treatment in the presence of moisture improved the quality of soybean protein.

More than 30 proteins or protein-rich foods had been assayed in the department for methionine, a nutritionally essential amino acid containing sulphur, by two chemical methods and a microbiological method. The results by the three methods were in close agreement. The microbiological method represents a substantial advance in protein analysis. It has advantages in speed, economy, simple equipment needed and in the minute quantities of the protein required, and is applicable directly to food materials.

Food chemists have long wished that they could improve the contribution of the egg to the calcium content of the human diet. The eggshell is nearly half calcium, while both yolk and white are notably low in this nutrient. Technological advances that made dried egg a staple product for commercial bakers opened the way to its use in home kitchens.

It seemed feasible to experiment in increasing the calcium content of dried egg by adding ground shell.

It was found that the addition of 0.4% eggshell ground to pass a U.S. No. 400 sieve (openings of 0.0015 in.) yielded a product which could be used without detection in scrambled eggs, custards, ice cream, foundation cakes, muffins, popovers and yeast rolls. Eggshell particles somewhat coarser than the 400-sieve size were not detectable in baked custards, in vanilla-flavoured refrigerator ice cream or in foundation cake and yeast rolls.

The bureau of human nutrition and home economics completed a study of the nutritive value of the civilian food supply over a 37-year period—1909 through 1945. This brought to light trends through war and peace, good times and depression.

The starting point was an estimate by the bureau of agricultural economics of the annual per capita consumption of about 170 different foods—such as milk, meats, poultry, eggs, grains, fruits, vegetables, sugars and fats. Then, with average figures for calories, proteins, vitamins and minerals in these foods, the nutritionists computed the nutritive value of the per capita food supply.

It appeared that during the years of World War II food for U.S. civilians on the per capita basis contained more calcium, iron, B vitamins, vitamin A and vitamin C (ascorbic acid) than at any other time in the 37-year period. Important in bringing about these gains were milk, eggs, vegetables and fruit and the enrichment of white bread and flour. Calorie and protein levels during World War II were somewhat higher than in the 1930s, but not above consumption in the decade prior to 1920.

Over the whole period there was a steady increase in calcium, vitamins A and C and riboflavin in the B vitamin group. The rise in calcium and riboflavin was largely because of greater consumption of milk; the rise in vitamins A and C because of increased use of fruits and vegetables. Accounting in large measure for this increase in vitamin C was the more than fourfold increase of citrus fruits after 1909.

Thiamine and niacin fell to all-time lows in 1935, coincident with a sharp fall in meat supply, especially pork. From that time these values were on the upgrade, associated in part with higher meat consumption, in part with enrichment of a large proportion of the flour, bread and cereal.

The study furnished a perspective against which to appraise current supplies, the probable effect of food emergencies and the nutritive value of the food of various nations.

International Food-Consumption Studies.—Studies of the food-consumption levels of the United States, Canada and the United Kingdom, first made on a comparative basis for the year 1943, were extended through 1945. The results show that in 1945, as in 1943, the United States, Canada and the United Kingdom each possessed reasonably adequate supplies of food to meet nutritional requirements for their populations. Total supplies of foodstuffs in terms of calories varied only slightly from prewar levels.

Important shifts in types of food available for consumption were found in all three countries, which made distribution difficult, created great hardship in the preparation of meals and in some cases necessitated rather radical changes in personal eating habits. Meat rations, for example, were reduced in the United Kingdom during 1945 until the supply moving into civilian consumption was 21% below the prewar average, while beef supplies in the United States were 15% below the prewar average during the first 6 months of 1945. Total protein supplies available in 1945 for domestic consumption in the United States, however, were 14% and in Canada 9% above the prewar level. British protein levels were 10% above those of prewar years but were made up of vegetable proteins to a much greater extent than in the United States or Canada.

There were other notable differences in 1945 diets as compared with those of prewar years. Supplies of sugar were down 18% in the United States, 24% in Canada and 32% in the United Kingdom. The decline in fats and oils was also great, amounting to 11% in the United States, 10% in Canada and 20% in the United Kingdom. Supplies of milk and milk products, excluding butter, were up 30% from those of prewar years in the United States, up 21% in Canada, and up 30% in the United Kingdom. Potato consumption did not fluctuate greatly during the war years in either the United States or Canada, but in the United Kingdom averaged 60% above the prewar level for the whole year 1945 despite a temporary shortage during the spring of the year.

The department of agriculture also deemed it necessary in view of wartime exigencies and postwar shortages to participate in the making of food-supply estimates in countries other than the United States, Canada and the United Kingdom. Representatives of the department served on Inter-Allied committees in both 1944 and 1945. They assisted in preparation of food balance sheets for the Allied countries of continental Europe and estimates of food supplies available in enemy countries.

Estimates had been made by the department of agriculture during the past several years of indigenous production and the total available supplies of foodstuffs in all the countries for which adequate statistics for measuring consumption were available. Data gathered in 1946 by the department from all over the world were made available to the Food and Agriculture organization and to the United States representatives on the International Emergency Food council, enabling them to compare relative needs for various foods on a scientific basis. Australia had also made an analysis of the food levels in that country, using the same method as that employed in the original United States-Canada-United Kingdom nutrition studies.

International food-consumption comparisons are valuable for the future in that they promote improvement not only of statistics, but also of nutrition and markets for agricultural products among nations generally. In response to a request of the Food and Agriculture organization, members of the U.S. department of agriculture and other agencies outlined suggestions for a food-consumption statistical program. The F.A.O. adopted the principle that the improvement of nutritional levels and fulfillment of

other objectives as provided in the constitution of the F.A.O. would require national food-consumption statistics programs and international collaboration in the field of food consumption statistics. (See also *DIE-TETICS; FOOD SUPPLY, WORLD.*) (A. P. Cw.)

Food Supply of the World.

Food production and distribution continued to command the first attention of the nations through 1946 as it had from V-E and V-J days. Adequate food was recognized as essential to peace, to check revolution, to avoid famine and to lead people to resume normal industry and commerce essential to a peaceful economy. The world's food situation in Jan. 1946 was not generally encouraging. The several years of record-breaking production in North America did not offset the deficiencies in the heavily populated areas of central Europe, China and many other regions. The more liberal rationing that followed the end of hostilities consumed the scant reserves faster than transport of new supplies could be organized. More than the usual proportion of the world's food supply was consumed in the first half of 1945 leaving reduced stocks later in the year.

Production of food crops was estimated at the beginning of 1946 at 12% below the prewar average of 1935-39. More serious was the fact that the production was lowest in areas that were normally food deficit areas, which placed an increased burden upon the relief agencies. This was particularly true of Germany where food production was disturbed late in World War II and began to recover very slowly in 1945. Consumption was the lowest in the former enemy countries, Germany, Japan and Italy. The liberated countries such as France, Belgium, the Netherlands and Norway had restored production to a marked extent and required less aid. The food supply of farm people had improved faster than that of the larger cities. Because of disrupted transport, storage facilities, lack of confidence in money and other interruptions of trade the producers declined to deliver produce and the city stocks became exhausted. The severely bombed cities of Germany were particular sufferers. Distribution of food products by government agencies was almost everywhere essential.

The operations of the United Nations Relief and Rehabilitation administration provided a comprehensive check on the needs of the deficient areas. While it did not serve all the needy nations, its surveys of supply and distribution gave it a world-wide view. Early in 1946 it became evident that the requirements of Europe alone would place a heavier burden on U.S. supplies, and ways and means of increasing exports were considered. The termination of lend-lease had thrown a heavier burden on U.N.R.R.A. although the former was supplying Allies and not enemy or neutral countries.

Grain harvests were generally very good in 1946 and above 1945 as well as the prewar average. This did not mean that a larger amount was available for consumption, however, since stocks had been greatly reduced. The demand for grain foods was strong, however, because of smaller supplies of other foods such as meat and vegetables. Many people were almost entirely on a bread diet. The world's wheat crop was estimated at more than 4,000,000,000 bu., not including the soviet union and China, or more than 5,000,000,000 bu. in all countries. The big crops of the United States and Canada would not provide exports so large as in 1945-46, however, since much of the 750,000,000 bu. exported by the United States and Canada came from stocks which had been reduced to record low levels. World rye production was still 16% below the prewar level since the crop had not recovered in Germany and Poland. Argentina had a considerable surplus for export.

Rice production was estimated at 10% above the 1945-46 crop but still 5%-10% short of the prewar level which was about 7,431,000,000 bu., 1935-39. Since rice supplied about

20% of the world's food supply, it was vital to those countries where it was grown, such as China, which formerly produced 35% of the world's supply, and India, where 25% was raised. Rice did not usually enter into trade but in 1946 the western hemisphere shipped large quantities for relief. The rice crop harvested in the fall of 1946 was the first crop in oriental surplus-producing countries to be planted after World War II, and many areas in China, Burma and the Philippines were not able to resume normal production because of local disturbances.

Sugar production recovered slowly and gained about 10% in 1946 over 1945. The supply for consumption did not increase markedly since stocks had been drained and domestic consumption in producing countries reduced exports. Europe produced more beet sugar, North American and Caribbean production increased but little was to be had from Java, Formosa or the Philippines where the sugar factories were destroyed during World War II.

Fats and oils, vegetable and animal, production was estimated to be slightly more than in 1945 but far short of the prewar level. Total output in 1945 was estimated at about 18,000,000 tons compared with the prewar average of 21,600,000 tons. Of this total not more than 3,000,000 tons was available for export. Hope for relief depended upon the restoration of exports of coconut and palm oil from the East Indies and Philippines and oil seeds from China. Peanut production increased slightly over 1945 but the future surplus had to come from Asia where two-thirds of the world's crop was grown. Butter, lard and other animal fats were all still about one-third below prewar production and recovered very slowly. The decline in hog numbers in Europe during World War II greatly reduced the output. Marine oils amounted to only about 30% of the prewar amount. Fishing was recovering very slowly because of the difficulty of obtaining ships.

Meat production declined in the United States, Canada and

other exporting countries after reaching a high level of total exports of 5,900,000,000 lb. in 1945-46. Livestock production in Europe declined from 1944 to 1945 and made only a slight increase in 1946 because of feed shortages and of emphasis being placed on growing cereals and vegetables for human food. Estimates early in 1946 indicated that cattle numbers were 2,000,000 less in North America, 6,000,000 less in Europe but 3,700,000 more in the soviet union than in 1945. Argentine meat production was declining in late 1946 after many animals had been marketed because of high grain prices. Argentina was the principal meat exporter in the year 1945-46 but fell more than 30% short of the record of 1944. Under agreement with Great Britain larger shipments to that country were expected to follow.

Stocks of dairy products that had been accumulated under wartime programs were mostly used in 1946 and the replacement of dairy animals was proceeding slowly in Europe because of the shortage of feed. Denmark and New Zealand were increasing their output but slowly. Total dairy production was estimated at only three-fourths of prewar volume. The dairy cycle in the United States and Canada being on the downgrade, surpluses from these countries were smaller. Great Britain made some increases in dairy output because of better feed supply.

Poultry numbers were being slowly replaced in devastated countries. Shipments of baby chicks and hatching eggs by aeroplane by U.N.R.R.A. gave prompt aid to some very needy areas. Egg production was so short of needs that rationing was continued in most European countries. Belgium and Sweden had almost normal production but other countries were still short of an adequate supply. Feed grain shortages handicapped production. About 500,000,000 doz. eggs were exported in 1946 by the United States, Canada, Australia, Argentina and Denmark. Only Canada and Australia expected to increase their output for 1947. About three-fourths of these exports moved as dried or frozen eggs. This supply was far from sufficient to meet import demands since Britain alone would take 450,000,000 doz. if available.

Vegetable production was expanding in all countries in 1946. Potatoes returned larger crops in nearly all European countries than in 1945 and rations were raised toward the end of the year. Other root crops and peas furnished the best food supply during the summer and fall months.

Food Situation by Areas.—The world's food situation from an over-all viewpoint showed improvement in 1946. The deficit areas were recovering while the surplus areas continued to be favoured with high record crops. Eight bountiful years in most of the western hemisphere partially offset the shortages of Europe and Asia but not completely. The great postwar requirements for relief were provided while at the same time consumption returned nearly to the prewar average in the United States. With another year of high production in the western hemisphere and a continued gain in production in Europe the outlook indicated that minimum supplies would approach prewar levels in most countries.

North America had high record production of nearly all food products in 1946. At the same time that area, United States and Canada, supplied the largest amount for export for relief. Canada's 40% increase in wheat production, 440,000,000 bu., served to replace its reduced stocks and to give a good balance for export. The feed situation was tight and reduced meat and dairy output. Great Britain would continue to take all the beef and bacon that Canada could export. Canadian potatoes returned a crop about 24% more than that of 1945. Mexico had a good season in 1946 with a corn crop about one-fourth larger than in 1945. Imports were necessary, however, to provide adequate wheat, rice, sugar and fats. Some surpluses of beans, peas, bananas and other fruits were exported. Meat supplies were about in balance with demand.

South and Central American countries had crops better than in 1945 although those that usually produce surpluses were not up to their prewar levels. Argentina, the chief exporter of South America, exported less wheat, flax, pork and lard than in 1945 but more corn, beef and mutton. Brazil had good food crops but was again turning to cotton growing in place of rice and corn. Other Latin American countries were recovering domestic food production and beginning to provide prewar normal surpluses. Cuba increased its sugar output of which 90% was exported and one-third of the food supply imported. Banana exports increased from Central America but were limited by the shortage of shipping.

The United Kingdom and Eire experienced an excessively wet harvest season causing heavy losses of grains. Britain's wheat crop was reduced to 68,000,000 bu. compared with 81,000,000 bu. in 1945. Potatoes and beets were also damaged. Stock feeds and hay were damaged but low-

IN "BREAD CAST UPON THE WATER," Werner of *The Chicago Sun* saw ample return to the U.S. for sharing its food supply with the world in 1946

RUSSIAN WHEAT being examined by French dock worker in the hold of a freighter at Marseille, France, in April 1946. This was the first shipment under an agreement whereby Russia was to supply France 400,000 tons of wheat and 100,000 tons of barley

grade grains were turned into livestock feeds. Fruits, vegetables and hops were seriously damaged. Severe rationing was continued throughout the year almost as limited as in wartime and every emphasis laid on increasing exports at the expense of reduced purchases of imported foodstuffs. The shortage of 1946, however, led the government to make contracts with the dominions, Denmark and Argentina for larger quantities of wheat, beef, pork, butter, cheese and eggs. The government was continuing strict control over food supplies. Plans to control farm production permanently somewhat as was done during World War II were also proposed by the Labour government. Food production in Eire was severely reduced in 1946 by the wet season and smaller production of meat. Rationing was continued as in 1945.

Europe as a whole produced foods in supply about 10% below the prewar level. Germany, Austria and the lower Danube valley countries were the deficit areas. The western European countries made substantial gains and in several cases brought production above the prewar level. Denmark made the greatest gain, Sweden and Norway exceeded their normal production and Belgium and the Netherlands recovered most rapidly. Since Europe as a whole normally imports about 10% of its food supply, the return to 90% of prewar level leaves a margin of about 20% deficiency. During 1945-46 Europe received more than 13,000,000 tons of grain and flour, 725,000 tons of sugar, 575,000 tons of fats and nearly 350,000 tons of meat as relief shipments and exchange imports. Food consumption was at a very low level early in 1946. The city population of Germany, Austria and Italy had an average of less than 1,600 calories per day. The range was from 2,400 to 2,600 in the Netherlands, Belgium, France and Switzerland, while in Denmark the supply allowed 2,700-2,900 calories per day. Several times during the year shipments were alarmingly slow and appeals were made for more aid for central Europe. Late in 1946 the Italian situation became acute and food riots occurred in several cities. Farm stocks were particularly low in southern Italy and deliveries to cities were inadequate in the northern provinces. France made an increase in the average ration of about 25% over 1945 but continued to ration bread through 1946. The Netherlands made a gain of about 20% in terms of calories per capita over 1945 in spite of the losses of land from flooding during World War II which had not been fully reclaimed. Livestock increased to within 10% of the prewar level, milk was about 70% of prewar but pigs were held down to 60% of former normal numbers to save feed grains. Switzerland had a good crop output but livestock was held down by the feed shortage. The average for the country was about 2,700 calories per day. Norway recovered rapidly in both crops and livestock as well as in the fishing industry. The latter had almost reached the prewar level, one-fifth of which was used for

domestic food.

Spain and Portugal recovered from the severe drought of 1945 with the best crops in several years in 1946. Altogether, however, Spanish agriculture was in a very low state because of poor farm methods, lack of machinery and work stock. The food supply of 1946 provided only about 2,000 calories per day or 85% of the 1931-35 average. The country was still suffering greatly from the destruction of the civil war. Portugal was on even lower rations in 1946 than Spain and needed large imports for 1946-47.

In the Danube states Hungary and Rumania had better crops in 1946 than in 1945 but were below the prewar level when large quantities of foodstuffs were exported. Rumania experienced a severe drought which held the 1946 crop output to about the same level as 1945. Livestock was limited by the shortage of stock feeds. Bulgaria suffered less during World War II and with fairly good crops in 1946 was able to provide the people with about 2,700 calories per day. Yugoslavia raised more food and with U.N.R.R.A. aid in machinery, draft animals and seeds made good progress to a level of about 2,500 calories per day. Greece increased domestic food output but because of the very low state of agriculture was more dependent on U.N.R.R.A. aid than other countries. The average food level of 1945-46 was estimated at 2,200 calories of which about 45% was imported by U.N.R.R.A. Vigorous efforts were begun to replace this supply in 1947 when relief shipments were expected to decline sharply.

The Soviet Union increased food production in 1946 but supplies were still so short as to make severe wartime rationing necessary. Only bread was available to the full extent of the ration at the end of the year. Crop conditions were quite variable over the large area and droughts were reported in some regions while high returns were recorded for others. In the absence of complete information observers estimated that grain production was increasing but that livestock was still a serious deficit. An agreement was made with Denmark to import 33,000,000 lb. of butter in the year beginning July 1, 1946, in exchange for grain and oil cakes. There appeared small prospect of the Soviet Union's being able to enter the world market to any large extent for several years.

In North Africa and the middle east 1946 yielded sufficient foodstuffs for domestic subsistence and some increase in exports. Turkey had record crops as weather was generally favourable. Egypt had a surplus of rice for export to exchange for bread grains, wheat and corn, which were short crops. Iraq, Iran, Syria and Lebanon had ample grain crops and some surplus of olive oil to export in exchange for sugar. The Palestine citrus crop was expected to yield 5,000,000 cases for export. Other crops were poor, however, and a large part of the food supply had to be imported. Any increase in population increased this problem as agricultural production expanded very slowly under irrigation.

In the far east crop production as a whole was larger in 1946 than in any other year since the beginning of World War II. In the vast area of

China some places continued on the verge of famine, while others yielded small surpluses. The efforts of the government and relief agencies had ameliorated the situation as much as could be expected with the shortages of transport. The food problem of China was so large that no substantial change could be expected in less than a decade of modernization. In India the rice crop was uneven, good in Bengal, average in eastern India and poor in Madras. The problem of the government was to regulate movements of surplus to needy areas rapidly enough to maintain minimum rations. The Burma, Siam and Indo-China area was reported to have a surplus of about 2,000,000 tons of rice from the 1946 crop. Military and political disturbances were disrupting trade seriously in the late months of 1946 so that shipments might not reach the areas of deficit.

Japan with about 78,000,000 people had about 2,300 calories of food per capita before World War II, which declined to about 2,000 during the war. Of the 5 principal crops—rice, sweet potatoes, white potatoes, wheat and barley—the first 2 supply about two-thirds of the domestic supply while about 4,000,000 tons of rice must be added to maintain the wartime ration of 2,000 calories. The imports formerly came from Korea and Formosa. Some beans were also imported from Manchuria. In 1946 Korea had no surplus and had to look to China and Manchuria for imports. The prospect indicated that more fish would probably be added to the diet and severe rationing continued in relation to the kind of labour required.

Food production in the Philippine Islands improved rapidly in 1945 and 1946 to about 80% of prewar for rice and only a small deficit of corn and sweet potatoes. Exports of copra were purchased by the U.S. government which would provide the islands with means to buy the food supplies needed. Livestock and poultry numbers increased in 1946 and were expected to be fully restored in three or four years.

Australia enjoyed a fruitful year 1946 with drought in one area only. The crops of wheat, rice and fruits were better than in 1945. Dry weather and strikes reduced the meat output of Queensland and hog production declined because of the high price of feeds. New Zealand also recovered from the effects of the drought of 1944-45 and expected substantial increases in the crops of 1946-47. South Africa crops were slightly larger than in the drought years, but fats and oils were still scarce. The chief items for export were citrus and other fruits.

World Food Organizations.—The vast efforts of all nations to provide more food for their people following the end of major hostilities stimulated both international and national agencies to a high pitch of activity. The Combined Food board which represented the United States, Canada and the United Kingdom in allocating food supplies during World War II reported to the U.N.R.R.A. council in March that wheat supplies for export appeared likely to be short 8,000,000 tons. This and other alarms started a series of movements to check threatened famine in Europe and other parts of the world. The president set up a National Famine Emergency committee with former Pres. Herbert Hoover as chairman. This committee appealed to the people of the U.S. to conserve food in order to save 40% of the grain and 20% of fats and oils that might normally be used during the spring months. Chairman Hoover made a personal survey of Europe in March to review the situation and later in May flew to South America to determine the aid that might be expected from that area.

The general assembly of the United Nations issued an appeal to all governments to take drastic action to conserve supplies of food and to increase production of grain. The Food and Agriculture organization (F.A.O.) as the permanent agency in the field of food and agriculture invited all governmental agencies to participate in a special meeting on urgent food problems which was held at Washington, D.C., May 20-27, 1946. An appraisal of the world food situation was issued by F.A.O. which stated that "a critical world food shortage will continue at least until crops are harvested in 1947." Representatives of 22 nations and 6 organizations approved recommendations on ways and means of conserving and increasing food supplies and also urged that the Combined Food board be reorganized into the International Emergency Food council (I.E.F.C.) with membership open to any country that desired to co-operate. This proposal was carried out in June when 19 nations joined to establish I.E.F.C. which took over on July 1, 1946, the work formerly done by the Combined Food board.

As the emergency measures were put into action to get grain for relief, such as the 30-cent premium for immediate delivery of wheat, and the record-breaking new crop of wheat became assured, the situation improved. The U.N.R.R.A. was slated to end in 1947, however, and appeals began to be made to continue it or prepare some organization to follow.

A World Food survey of the situation in prewar years was made by F.A.O. during the first half of 1946 as a guide to proposals for future food and agricultural policies. Food experts from the United States, Great Britain and other countries gathered available information from international and national agencies covering 70 countries with about 90% of the world's population. Although obviously incomplete the results were sufficient to serve as a comparative measure of the situation. The conclusions of this survey indicated that slightly less than one-third of the world's population had food supplies of more than 2,750 calories per capita per day. More than half of the world's people lived in areas where the supply was less than 2,250 calories per day and the remainder, about one-sixth, lived in areas having 2,250 to 2,750 calories per day. While many people in each of those areas had more than the averages there were probably more that had less, reflecting the generally deficient world food supply compared with countries that had an abundance and consumed about 3,000 calories daily.

The final conclusion from this survey was that half the world's people were underfed before World War II in that they subsisted on a diet inadequate to maintain normal health, allow for normal growth of children and furnish energy for normal work. In order to bring food production to an adequate level by 1960 and to feed a 25% increase in population the principal foods would have to be increased as follows: cereals 21%, root crops 27%, sugar 12%, fats 34%, peas and beans 80%, fruits and vegetables 163%, meat 46% and milk 100%.

The magnitude of the task to get such an increase in food production was fully emphasized by the survey. F.A.O. recognized the practical and

FRENCH BOY receiving his ration of two eggs per month; during the early part of 1946, however, the supply was not enough for this meagre allotment

political problems involved. A proposal for a World Food board was prepared by Sir John Orr, director-general of F.A.O., and presented at the second session of F.A.O. at Copenhagen, Denmark, Sept. 2-13, 1946. The proposal was referred to an F.A.O. preparatory commission of 16 member nations that met at Washington, D.C., Oct. 28. This commission was still in session at the year's end. Efforts were made to co-ordinate the work of this commission with that of the International Trade organization, the International Bank for Reconstruction and Development, the International Labour office, the International Monetary fund and the Economic and Social council. The soviet union and Argentina, though not members of F.A.O., were invited to participate.

FILMS.—*Distribution of Foods* (Encyclopædia Britannica Films Inc.). (J. C. Ms.)

Football. Army went through its third successive season without defeat in 1946 as intercollegiate football, strengthened by a flood of returning service veterans, broke all records for attendance.

Interest in the West Point eleven and its backfield pair, Felix (Doc) Blanchard and Glenn Davis, continued to remain paramount despite the fact that strong teams arose in all parts of the United States with a host of former varsity players back on the campus. The gap between Army and the rest of the field, so wide in 1945 and 1944, was closed, but no rival was able to bring down the "Black Knights of the Hudson." The winning streak of the team, however, was brought to a pause when it was held to a scoreless tie by Notre Dame under the leadership again of coach Frank Leahy, back from the navy.

Despite that checkmate, Army continued to rank as the number one team of the country until, in its final game with Navy, it narrowly escaped defeat in the most sensational contest of the year. Beaten in seven successive games—the worst record in its history—the eleven from Annapolis capped a season of almost unparalleled surprises by coming within a few yards of tumbling the cadets in defeat.

The midshipmen, trailing by 21-6 at the end of the first half, completely outplayed the West Pointers for the rest of the game. Scoring two touchdowns, they still trailed by 21-18 as a result of their failure to kick the extra points. Then, in the last few minutes, they drove 64 yd. to their rival's 3-yd. line.

Nothing, it seemed, could save the invincibles of Earl Blaik from one of the most shocking defeats in history. Favoured by 28 points, Army was all but helpless against the fury of Capt. Tom Hamilton's fighting eleven from the Severn. As Navy

ripped the West Point line apart for gain after gain, the big clock in the huge Philadelphia Municipal stadium showed time rapidly running out. But, with the ball on the three-yard line, a minute and a half remained to play—sufficient, apparently, for the middies to get across the goal line.

But the touchdown never came. Fighting with their backs to the wall as they had never been forced to fight before in their three years of sway, the weary, battered cadets had the morale and the strength to save themselves. Twice the Navy fullback hurled himself into the line and each time he was stopped without gaining an inch. Then the middies were penalized five yards for taking an extra time out to make substitutions.

On third down, a lateral play around end was called. The ball carrier was downed just inside the five-yard line. The crowd was encroaching on the field of play, with only a few seconds remaining to play. A substitute rushed out from the Navy bench to stop the clock. The officials failed to see him in the excitement. Even had the clock been stopped for the substitution, which would have brought another five-yard penalty, there would hardly have been time to launch another play. A pistol barked and the game was over. Navy's gallant bid for victory had failed by a few scant yards, and by that margin the finest record in West Point history was preserved.

Army had completed 3 years with a record of 27 victories and 1 tie. Blanchard and Davis, who had scored all three of West Point's touchdowns on typically brilliant plays, had wound up their careers in glory, even if Navy's backs had stolen their thunder in the second half. Along with them seven other regulars played their last game in the black, gray and gold of Army.

As a consequence of their narrow escape from disaster the cadets were ousted from their number one position in the final nation-wide poll. Notre Dame, which had won every game except its tie with Army, was ranked at the top and its quarterback, Johnny Lujack, who had come back from World War II, was chosen on almost every all-American team, ahead of Army's brilliant Arnold Tucker.

Nevertheless, Earl Blaik was named in a nation-wide vote by his colleagues as the coach of the year, in recognition of his expert direction of a team that was sorely lacking in reserve strength and bringing it through unbeaten for the third season against such formidable opponents as Notre Dame, Michigan, Oklahoma, Duke, Pennsylvania and five others. Also, Davis was awarded the Heisman trophy as the player of the year. He and Blanchard, who was handicapped by a knee injury from the opening game, were unanimous all-American selections.

Two other major elevens escaped defeat. They were Georgia, the strongest team in the south, which tied with Tennessee for the Southeastern conference championship, and the University of California at Los Angeles (U.C.L.A.), Pacific Coast conference leader.

After these four were ranked Illinois, winner of the Western conference championship for the first time after 1928; Michigan, Tennessee, Louisiana State, North Carolina, champion of the Southern conference and Rice, which shared the Southwestern title with Arkansas. Georgia Tech, Yale, Pennsylvania, Oklahoma, Texas and Arkansas followed.

An agreement was reached between the Pacific Coast and the Western conferences whereby representative teams of these two groups were to meet in the Rose Bowl for three years and possibly five years. U.C.L.A. and Illinois as the champions of the two conferences were chosen to inaugurate the rivalry. They met in the Rose Bowl at Pasadena Jan. 1, 1947, and Illinois won by the score of 45-14.

In the Sugar Bowl at New Orleans, Georgia and North Carolina played and victory went to the former by 20-10. In the Orange Bowl at Miami, Fla., Rice defeated Tennessee 8-0 and

in the Cotton Bowl at Dallas, Tex., Louisiana State and Arkansas battled to a scoreless tie.

The most stunning upset of the year was registered when Princeton defeated Pennsylvania, the favourite by 30 points or more. Alabama, which was ranked by some at the start of the season as the best team in the country, lost four games. Texas, which was thought to have its best squad in history and was given top position, ahead of Army, in an early poll, crashed in defeat twice. Ohio State, Southern California, St. Mary's, Holy Cross, Pennsylvania and Indiana were other teams that failed to measure up to expectations.

Attendance in 1946 was 48% higher than in 1945, when record crowds turned out. Michigan, Pennsylvania, Notre Dame, Army and U.C.L.A. played to more than 500,000 spectators each.

The T formation was in use throughout the United States but there were numerous teams that employed the single wing. Some of them combined the two. Harvard, under Dick Harlow, used both the T and an L formation, from which it could switch to a double wing. Defenses varied as never before in the effort to circumvent the T. Five-man lines were common, but it was nothing unusual for a team to use a four, five, six and a seven-man line in the same game. The change in the rule permitting forward passing from anywhere behind the line of scrimmage encouraged more aerial manoeuvres and put a bigger burden on the defense. The "pitch-out" pass was strikingly effective, particularly as used by Army, and there was considerably more throwing of the ball laterally behind the line of scrimmage, though not down the field.

Outstanding players of the year in addition to Davis, Blanchard and Tucker of Army and Lujack of Notre Dame included Charley Trippi of Georgia, a unanimous backfield all-American selection; Burr Baldwin of U.C.L.A., Dick Huffman of Tennessee, Weldon Humble of Rice, Alex Agase of Illinois, Paul Duke and Robert Davis of Georgia Tech, Hank Foldberg of Army, Dick Scott of Navy, John Mastrangelo, George Strohmeier and George Connor of Notre Dame, Fritz Barzilauskas of Yale, Frank Wydo of Cornell, George Savitsky, Chuck Bednarik and Bernie Gallagher of Penn, Harry Gilmer of Alabama, Charley Justice of North Carolina, John Ferraro of Southern California, Herman Wedemeyer of St. Mary's, Warren Amling of Ohio State, Bobby Layne and Hub Bechtol of Texas, Ben Raimondi of Indiana.

Professional Football.—Like the college brand, professional football in the National league drew bigger crowds than ever before. The new All America conference began operations as a rival loop, with many players on its rosters who had been lured away from the old organization. The All America did not enjoy the patronage that did the National league, with the exception of one club. The Cleveland Browns attracted tremendous crowds in their huge lake-front stadium, topping all other clubs in both circuits in attendance. The remaining teams in the new loop did not fare nearly as well and many of them lost heavily, with their big pay rolls.

The New York Giants enjoyed by far their best season in history at the box office. Their clientele, built up over a period of years, were loyal, and 40,000 to 60,000 turned out regularly while the rival New York Yankees and the Brooklyn Dodgers of the All America conference were attracting considerably fewer.

The Giants, with a powerful line, their usual strength on the defense and an exceptional passer in Frank Filchock, who formerly sat on the bench as understudy to Sammy Baugh of Washington, won the Eastern championship. The Chicago Bears, rejuvenated with the return of their stars and coach, George Halas, from the service, regained their old position at the top in the Western division. In the playoff for the league championship before a record crowd of 58,346 at the Polo Grounds, the Bears defeated Steve Owen's Giants, 24-14.

On the morning of the game the public was shocked to learn that an attempt had been made by gamblers to "fix" the outcome of the playoff in favour of the Bears. Two backs on the New York team, already weakened by the injury of key operatives, were offered bribes by the agent of a bookmaking ring, to "lay down." For a week before the game the New York police department had knowledge of what was brewing. With Mayor William O'Dwyer taking a hand personally in the investigation, the alleged "fixer" was seized.

The two players were Merle Hapes and Filchock. It was announced that the bribe offer had been rejected by both, but Hapes was barred from the grounds and not permitted to take part in the game. Filchock was allowed to play and was one of the Giants' hardest and ablest

DON GREENWOOD of the Cleveland Browns bucking the line for a touchdown against the Miami Seahawks on Sept. 6, 1946. This opening game of the first playing season of the All America Football conference was at Cleveland stadium where the Cleveland Browns won the game, 44 to 0

workers, throwing two touchdown passes. It was explained that he had had no direct contact with the "fixer." Hapes was scored for failing to report the bribe offer to his coach.

The district attorney took charge of the case and the agent was indicted for bribery. It was reported that threats had been made against his life to prevent his testifying against the betting ring. The scandal was front page news and awakened the sports world to the menace of the gamblers, whose operations for the year were said to have netted them \$25,000,000.

In the All America conference the Cleveland Browns, coached by Paul Brown, formerly of Ohio State, made a runaway race in the western division. The New York Yankees won in the east. In the playoff, the Browns defeated the Yankees, 14-9, on Dec. 22 at Cleveland.

Canada.—Led by Joe Krol, brilliant halfback, who was recognized as the outstanding player of the year, the Toronto Argos defeated the Winnipeg Blue Bombers, 28-6, to win the Grey cup and the championship of the dominion.

Interest in football was greater in 1946 than in any previous year. More teams competed in every division, from senior to bantam, and attendance figures rocketed. French-Canadians turned their attention to the game as never before, with the Montreal Alouettes as the big attraction. When the Alouettes played the Argos in Montreal, 25,000 fans turned out, setting a new record for Canadian football.

The Argos and the Alouettes finished in a tie for first place in the Big Four union. They met in a "sudden death" playoff and the Argos won by 12-6. The Toronto team faced severer opposition in the east than it did against the Winnipeg Blue Bombers. After winning from the Alouettes the Argos defeated the Toronto Balmy Beach club, champion in the Ontario Rugby Football union, 22-12. This victory qualified them to play Winnipeg, the western leader, for the dominion title.

The University of Western Ontario won the championship of the Intercollegiate Rugby Football union. The college teams had a rule that prevented them from competing for the Grey cup. The senior unions, with the exception of the intercollegiate, were more or less openly professional and were allowed to import a limited number of players from the United States. Some of the U.S. professional clubs "farmed out" players to Canadian teams.

The Jeff Russell Memorial trophy, awarded annually to the player in the Big Four who best combines effective play with leadership and sportsmanship on the field, was awarded to Krol. (A. D. A.)

Great Britain.—Rugby.—At the end of 1946 the Rugby union had arranged the game precisely on its prewar footing. A record crowd saw the brilliant Oxford team beat Cambridge at Twickenham by 15 points to 5. A finer Oxford side had not been seen since G. P. S. Macpherson's time,

and they had won all their matches, most of them with ridiculous ease, before they met Cambridge.

The county championship and the international championships both went on as in 1939. Earlier in the year the "Kiwis," a New Zealand team, lost only 2 of the 27 games they played in Great Britain. The best international side was easily Scotland, even though England beat them after a thrilling game at Twickenham. Keith Geddes (Scotland), Bleddyn Williams (Wales), J. Heaton (England) and C. Murphy (Ireland) all played well. Once more, St. Mary's won the hospital cup, and the Army the interservices tournament.

There was a fine Rugby league final at Wembley where Wakefield Trinity beat Wigan by 13 points to 12. The league sent a side to Australia, captained by A. J. Risman. They won 2 tests and drew the other and lost only 3 matches out of the 20 they played.

Association.—The season was marred by a serious accident at Bolton, where, in a cup-tie match in March, one of the stands collapsed and 33 people were killed and more than 500 injured. The sparkling football of S. Matthews, the Stoke City outside right, continued to dominate the game and draw the crowds. Derby county won the cup final, beating Charlton Athletic by four goals to one; and Aberdeen beat the Rangers for the Scottish cup. For a change Bishop Auckland did not win the amateur cup, losing this time to Barnet (3-2), at Chelsea, before a record crowd of 54,000. Honours were about even in the international matches, and Scotland beat England (1-0) in a desperate game at Glasgow. At the end of 1946 England beat Ireland at Belfast fairly easily, but had the utmost difficulty in beating Eire at Dublin a few days later by one goal to nil; Wales beat Scotland, Cambridge won the University match (3-2). Visiting teams from Sweden and Denmark met with success.

Foreign Exchange: see EXCHANGE CONTROL AND EXCHANGE RATES.

Foreign Investments in the United States.

The value of foreign investments and other dollar assets in the United States on June 30, 1946, was placed at \$16,200,000,000. This figure was \$300,000,000 below the record level reached in the preceding December. The sharp decline in security prices during the last half of 1946 cut the value of these investments by an additional \$550,000,000.

The need for dollars with which to pay for commodities and equipment for reconstruction and development was reflected in foreign withdrawals of \$500,000,000 of short-term balances and sales of almost \$200,000,000 of U.S. securities during the first 6 months of 1946, in addition to the vast sums borrowed in the United States. It was, therefore, not surprising that practically no new foreign direct investments were made in the United States in 1946. One of the few investments reported was the acquisition by a British concern of a substantial minority interest in a U.S. engraving and printing company.

In general, the foreign interest in U.S. security markets in the first half of 1946 seemed to be concerned with the disposal of U.S. securities for cash, except for Canadians who were reported to have purchased \$60,000,000 of U.S. securities. The preliminary steps in this disposal were taken at the outbreak of the war in 1939. At that time the French government had taken steps to mobilize French external assets, particularly investments in the United States. The invasion of France forestalled the sale and utilization of the proceeds of these assets for the French war effort. With the liberation of that country, a large portion of the assets remained as a potential source of funds for reconstruction and development. However, at the close of 1946 it appeared that the degree of mobilization of French investments in the United States would depend on the French request for a \$500,000,000 loan from the International Bank for Reconstruction and Development. In any case, the press reported that in the event of mobilization the matter of an orderly liquidation, one that would not be apt to depress unduly U.S. security values, would be discussed with U.S. administrative and stock exchange officials.

Sizable liquidations of Netherlands holdings of U.S. securities were frequently mentioned during 1946 although their extent and timing also appeared uncertain. In September, the Netherlands minister of finance stated that sales of Dutch-owned U.S. securities with a value of between \$600,000,000-\$800,000,000 were expected to begin in ensuing weeks. The minister explained that the projected liquidation was largely because of pressure on Dutch owners to finance recovery and reconstruction as well as to meet taxes and capital levies in the Netherlands. During the year the Finnish government required that all foreign securities in Finland were to be turned over to the Bank of Finland (for payment in marks). This move reflected that country's dire need for dollars and other foreign currencies.

Alien Property Custodian.—From March 11, 1942, until June 8, 1945, the control of the property in the United States of nationals of enemy and enemy-occupied countries was divided between the treasury department and the Office of Alien Property Custodian with the latter having jurisdiction over enemy

business enterprises. Thereafter, the custodian had jurisdiction over all property interests formerly under treasury jurisdiction. In Oct. 1946 the functions of the custodian were transferred to the justice department. The organization was thereby returned to the prewar location of its predecessor whose functions had been to wind up the settlement of claims arising from the vesting of enemy properties seized at the time of World War I.

During World War II the office was established principally to vest in the U.S. government title to productive enemy assets in that country and to put them to the fullest possible use in the nation's war effort. After the termination of hostilities the agency continued to seize properties as part of its program to eliminate all property interests in the United States of hostile German and Japanese nationals. The properties of German and Japanese citizens, resident in those countries, were not vested if they were victims of persecution by their governments. The surrender of Italy and its acceptance as a cobelligerent resulted in the suspension of Italian vestings in Dec. 1943.

In his terminal report (Terminal Report, Office of Alien Property Custodian, Oct. 1946, Washington, D.C.) the custodian noted that as of Oct. 1, 1946, he had vested property with an estimated value of \$247,000,000, which since vesting had increased through income and appreciation to \$290,000,000. At that time there remained to be vested \$140,000,000 to \$180,000,000 of additional property. This was exclusive of his holdings of 46,000 patents and inventions, at least 500,000 copyrights and many other valuable interests that could not be appraised in dollars. Of the 414 vested enterprises in which enemy control had been partial or complete, about a fifth had been continued as going enterprises during the war, producing \$600,000,000 of war goods and winning 31 army-navy "E" awards for excellent production.

During 1946 a comprehensive reporting program under which all persons in the United States were required to report to the custodian all German and Japanese properties in their control or possession revealed that several thousand additional properties would probably be reported because of past failures to report and acquisitions of new properties by enemy nationals through inheritances.

In Sept. 1946 the custodian took an unusual step, one designed to prevent the shares of certain corporations under his control from ever again coming under enemy control or ownership. By a general order, stock ownership of designated key corporations seized by the custodian was prohibited from being acquired by any person not a U.S. national. The move was expected to forestall a repetition of an earlier experience in which properties seized by the custodian during World War I, and subsequently sold by him to Americans, were found at the time of World War II to have again come under enemy ownership.

Not all policies with respect to German and Japanese nationals had been fully formulated at the close of 1946. In particular, no definitive solution had been reached on the treatment of property in the United States belonging to (a) corporations in friendly countries wholly or partially owned by Germans and Japanese or (b) corporations in Germany and Japan wholly or partially owned by Americans and nonenemy foreign nationals. The problem involved the method of treating not only enemy equities but also the interests of nonenemy nationals associated in business with Germans and Japanese. Moreover, other allied governments faced similar situations, and in some cases the interests of the United States and its nationals were involved. It was expected that decisions on appropriate action in these cases would be made by international agreement.

The disposition of vested German and Italian property remained a matter for the congress to determine. The custodian, however, did take the position that hostile German and Japanese

nationals should neither have their properties returned to them nor receive compensation for them from the United States, after U.S. claims against specific properties were settled and after expenses incurred by the custodian were reimbursed. Following World War I, enemy nationals had received up to 80% of the cash value of their properties seized during the war. Regarding the property of nationals of Italy, Hungary, Bulgaria and Rumania, the custodian thought that the question of return should be determined by the terms and spirit of the peace treaties with these nations and noted that the treasury and state departments shared this point of view.

Treasury Department.—The close of the active phase of World War II, on the other hand, was the signal for a series of steps by the treasury department aimed at releasing control of nonenemy foreign property in the United States. Prior to the involvement of that country in the war, axis control of assets in the United States had become a matter of official concern and as country after country was overrun its U.S. funds were frozen by executive order. A defrosting order, applied to French balances, bullion and securities under the treasury's jurisdiction in Oct. 1945, established the pattern applied to Belgium, Norway and Finland later that year, and to the Netherlands, Czechoslovakia, Luxembourg, Denmark, Greece, Switzerland and Liechtenstein in 1946. The complete release of these assets, however, was dependent upon certification by the several governments that the assets were in fact owned by their nationals.

The inclusion of Switzerland and Liechtenstein in the group of countries whose nationals' assets were defrosted was made possible by lengthy, although satisfactory, negotiations between Switzerland and the United States concerning the investigation of the ownership of property held in the latter country in the names of nationals of Switzerland and Liechtenstein for the purpose of identifying any such property in which there had been an enemy interest. By Jan. 1, 1947, the treasury had issued general licences which in effect provided that certified balances of all blocked countries (and their nationals) were thereafter to be treated as if such countries were not foreign, except those of Germany, Japan, Portugal, Spain, Sweden and Tangier. (See also EXCHANGE CONTROL AND EXCHANGE RATES.)

(M. AB.)

Foreign Trade: see INTERNATIONAL TRADE.

Forests. A reappraisal of the forest resources of the United States, completed by the U.S. forest service in 1946, brought out clearly that the nation had entered a period of reduced timber supply that would last a good many years. Supplies of lumber, pulpwood and a number of other timber products were short of demand throughout the year. Labour and equipment difficulties and other factors contributed to the shortage, but a major cause was the growing scarcity of readily accessible, merchantable standing timber in the forest areas of the country.

Total stand of sawtimber in the United States, as of 1945, was estimated in the forest service reappraisal at 1,601,000,000,000 bd.ft. This was an indicated decline of 44% from 1909, when a government estimate placed the total volume of sawtimber at 2,826,000,000,000 bd.ft. Actually the reduction in volume during the 36-year period was probably even greater, since the earlier estimate did not include many species and sizes now considered usable as sawtimber.

The reappraisal showed that the nation's timber resource had declined in quality as well as in volume. Inferior species or scrub growth had taken over large areas, and a general downward trend in the average size of logs reaching the sawmills was reported.

Annual drain of sawtimber from the forests of the United States was estimated in the reappraisal at a rate of 53,900,000,000 bd.ft. Annual growth was only 35,300,000,000 bd.ft. Sawtimber drain thus exceeds growth by more than 50%. Commodity drain (timber cut for use) represents 90% of the total yearly drain; the balance is losses from fire, wind, insects and diseases.

Included in the forest service reappraisal was a survey of timber cutting practices on commercial forest lands. Only 23% of all cutting was classed as good, from the standpoint of maintaining the forest in continuously productive condition. Twenty-five per cent was fair and 52% poor to destructive. The percentage of good cutting practice was highest on commercial forest lands in public ownership; on the national forests 80% of the cutting was rated good or better. On private forest lands only 8% of the cutting was good or better; 64% was poor to destructive. Since three-fourths of the U.S. total area of commercial forest land is in private ownership, including generally the best and most accessible timber-growing lands, the problem of perpetuating timber supplies is primarily one of raising the general level of forest practice on private lands.

In announcing the results of its reappraisal, the forest service recommended certain measures which it declared were necessary to reverse the downward trend of the nation's forest resource. These included (1) public regulation of timber cutting to prevent destructive practices and to require cut-over lands to be left in reasonably productive condition; (2) public aids to private forest owners, including increased co-operation in fire prevention and control, insect and disease control, research and technical advice on forest management and utilization problems and other co-operative aids to facilitate and encourage better management of private forest lands; (3) extension of public forests through federal, state and community acquisition and development of forest lands, especially those lands which, because of low productivity, depletion or inaccessibility, are not likely to be rehabilitated and developed by private enterprise; and (4) a large-scale program of reforestation and other forest improvement work.

An independent appraisal of forest resources also was completed in 1946 by the American Forestry association, a citizens' organization for the advancement of forest conservation. Although the findings of the association's two-year survey differed in some minor details from those of the more comprehensive U.S. forest service reappraisal, the two studies were in agreement as to the basic fact that the nation's timber resource had declined to an alarming degree and was still being consumed faster than it was being replaced by growth.

The American Forestry association presented the results of its forest resource appraisal at an American Forest congress, which met in Washington, D.C., Oct. 9-11, 1946, under the association's auspices. The meeting was called to consider proposals for a nation-wide program of remedial action in the light of new facts brought out by the two appraisals of the forest situation. Representatives of the forest industries, labour unions, various civic groups and federal and state forestry agencies participated in the discussions. There was general agreement as to conservation objectives, but differences of opinion as to how to achieve them. Chief point of controversy was the question of public regulation of timber cutting. Nearly all groups represented conceded a need for some measure of regulation. Representatives of the forest industries, however, favoured regulation by the individual states, while most of the other groups represented held that basic standards of forest practice should be set up by national legislation, although the states might conduct the actual regulatory programs in line with those standards.

Appointment of Marcel LeLoup of France as director of the Division of Forestry and Forest Products of the United Nations Food and Agriculture organization was announced in June 1946. LeLoup resigned his post as chief of the French department of waters and forests to accept the new position. Stuart Bevier Show, an American forester and member of the U.S. forest service, was named deputy director and chief silviculturist. An advisory committee of forestry experts representing various member nations of the Food and Agriculture organization was set up. Lyle F. Watts, chief of the U.S. forest service, was named chairman of the technical forestry subcommittee.

The new international forestry organization established headquarters in Washington, D.C., and prepared to set up world-wide forestry statistical services, assist governments with advice on forest policy, send out missions to make scientific studies, promote research and circulate findings

among nations and facilitate exchange of scientific personnel. (C. E. R.)

Great Britain and the Commonwealth.—The most significant event in forestry during 1946 was the September meeting in Copenhagen of the Forestry and Forest Products committee of the Food and Agriculture organization of the United Nations. A year's preliminary work, including the collection of forest statistics and information on state policy in the major timber-producing countries of the world, enabled the committee to make a useful diagnosis of the unsatisfactory position of world forestry. The basic causes of the critical shortage of wood existing in most parts of the world were stated to be: deforestation, caused by heavy overcutting, fires and careless destruction; inadequate forest management and failure to develop mature forests; incomplete and wasteful utilization; and insufficient technically trained foresters and staff.

In Great Britain it was estimated that three-quarters of the softwood forests were felled between 1939 and the end of 1946, and, although imports were once again the major source of supply, the urgent needs for timber, particularly of mining timber, delayed any drastic curtailment of fellings. A perpetual and large demand for pit props and pulpwood was, however, essential, to provide a market for the thinnings from the steadily increasing area of conifer plantations. The reorganized forestry commission had not had time to show results and was badly hampered, a large part of its staff being still engaged in Germany. Private estate forestry received further encouragement in October when the house of commons approved the policy of assisting forest owners with considerably increased grants toward planting costs and forest maintenance. The government, however, proposed to retain Ashdown forest (6,400 ac.), requisitioned as a training area in wartime, as a permanent military training ground. The large number of applicants for training in forestry of all grades, from short practical courses for woodmen to four-year university degree courses, would eventually reduce the acute shortage of trained men, but the inadequacy of the accommodation in schools, colleges and universities would seriously limit the numbers for several years.

In the commonwealth continued demands for timber for postwar reconstruction still diverted the time and energies of the forestry services from their proper functions. Because of the difficulties of obtaining timber from Russia and the Baltic for European needs, Canada was called upon to meet enormous demands. In Africa and India the increased demand for timber to meet new developments such as plywood and other wood industries provided markets for additional species and sizes and involved the opening up of forests which were formerly considered commercially inaccessible. By the felling of mature and over-mature trees the forests would eventually benefit by increased growth and production, if properly managed. Funds were at last made available for extensive vegetational and oecological surveys such as that completed in 1946 in the Caribbean islands. In the British crown colonies, particularly in Africa, there were new developments in forest policy and an emphasis on the satisfaction of the needs for forestry products of the local indigenous population, even where this was at the expense of export revenue. The training of native forestry staff of all grades, which in India had already led to the cessation of recruitment of Europeans, was perhaps one of the most important features of postwar forestry in many of the crown colonies. In Nigeria forest control by native administration was being established in 1946.

Europe.—In Europe, the outstanding development of 1946 was the exploitation of the forests of Germany for war reparations. Although normal annual fellings in Germany had been increased after 1936 by about 50%, the forests were well stocked at the end of the war. In 1946 the Black forest supplied large quantities of softwood for France, the British zone yielded a useful tonnage to assist in meeting reconstruction needs in Great Britain and the Rhineland provided pit props for Belgium and the Netherlands. The actual extent of the fellings in the soviet zone was not known but was not small. In France and Belgium the reforestation of war-damaged woods proceeded steadily. The greatest damage was to the maritime pine forests of the Landes, in France, where about 500,000 ac. were burnt between 1943 and 1945. The heaviest relative overfelling in Europe during the war was stated to be in Poland, Greece and the Netherlands, and it was only in the last of these three countries that any real progress in reforestation was made in 1946.

(A. H. LD.)

Formosa (TAIWAN OR T'AI-WAN). Formosa is a large island in the western Pacific, separated from China to the west by the Straits of Formosa and from the Philippines to the south by the Bashi and Balintang channels. Under Japanese rule the Pescadores (Bōkotō) and other outlying islands formed a political division of the Taiwan government-general. Area 13,836 sq.mi., and of neighbouring islands, including Pescadores, 77 sq.mi. Population (1940) 5,872,084; (1942 official Japanese estimate) 6,400,000.

Capital, Taihoku (326,407 in 1940); other large cities: Takao (152,265), Tainan (142,133), Keelung (Kiirun) (100,511) and Kagi (92,428). Principal religions were Buddhism, Confucianism, Taoism and Shintoism. In 1940 there were about 60,000 Christians.

History and Government.—Formosa was ceded to Japan under the treaty of Shimonoseki in 1895 at the conclusion of the Sino-Japanese War. The island was administered as a Japanese colony until the surrender of Japan in 1945, when Formosa was restored to Chinese sovereignty as a province of

China. In Oct. 1945, General Chen Yi, administrator of Fukien province from 1934 to 1941, assumed the governorship of Formosa for the Chinese National government. The Kuomintang is the dominant political party on the island.

Education.—In 1941 there were 1,000 primary schools with 12,076 teachers and 740,693 students; 6 normal schools with 225 teachers and 2,507 students; 4 colleges with 236 teachers and 1,385 students; and 1 university with 345 students.

Finance.—Under Japanese rule, Formosan currency was based upon the Japanese yen (valued at 23.43 U.S. cents in 1941) with the Bank of Taiwan as the central bank. Chinese National currency was introduced into Formosa when the island was returned to Chinese sovereignty and the Bank of Taiwan was closed.

Trade and Communications.—In 1939 there were 879 mi. of government railroads, 1,624 mi. of private railroads and 500 mi. of tramways; there were 10,000 mi. of roads of all types. There were 220 telegraph offices, 195 post offices and 123 telephone exchanges. Formosa's trade after World War II was almost entirely with China. In 1943 Formosa's overseas trade amounted to exports of about 400,000,000 yen and imports of 340,000,000 yen.

Agriculture.—Agricultural production in 1939 in short tons included: rice, 14,540,000 (44,800,000 bu.); sweet potatoes, 1,400,000; sugar 1,270,000; bananas 200,000; oranges 29,700; meat and poultry 27,600; tea 15,400. The 1946 rice crop was estimated at 54,000,000 bu., which was better than 1945.

Industry.—During the war Formosa produced sizeable quantities of coal, cement, chemicals and salt.

(S. NR.)

Forrestal, James (1892—), U.S. secretary of the navy, was born on Feb. 15 in Beacon, N.Y. He studied at Dartmouth college, 1911–12, and at Princeton university, 1912–15. He enlisted in the U.S. navy in 1917 and was assigned to its aviation force. Forrestal resigned from the navy with the rank of lieutenant in 1919 and resumed an earlier connection with Dillon, Read and Co., a Wall street banking firm, becoming its president in 1937. In Aug. 1940 he became undersecretary of the navy, serving in that capacity until the death of Secretary Knox, whom he succeeded on May 19, 1944. He aroused the ire of some Republican congressmen when he declared (Sept. 8) that publication of facts not disclosed in the Pearl Harbor reports would "compromise sources of information . . . of great value to our national security." He actively opposed the measure to unify the armed services under a civilian secretary.

Forrestal disclosed in his annual report (Feb. 7, 1946) that the U.S. planned to keep ready for "instant action" a fleet of 319 warships. He later asserted that a strong navy with widespread bases would be the surest defense against atomic attack. Although he had previously objected strenuously to a merger of the armed forces, Forrestal pledged to support the "objectives" of the president's plan to unify the services (June 26).

With regard to the first Bikini atomic bomb test Forrestal declared on July 1 that "heavily built and armoured ships are difficult to sink unless they sustain underwater damage." On Sept. 30 he stated the U.S. naval forces were in the Mediterranean and the eastern Atlantic in support of U.S. foreign policy.

Foundations: see DONATIONS AND BEQUESTS; SOCIETIES AND ASSOCIATIONS.

Four-H Clubs. Beginning about the time of the establishment of co-operative extension work in agriculture and home economics just prior to World War I, 4-H clubwork in the United States extended in 1946 into the rural counties of all 48 states, Alaska, Hawaii and Puerto Rico. Program leadership is given by the extension services of the land-grant colleges and the U.S. department of agriculture and (in 1946) by 165,000 adult and junior volunteer leaders. Membership in 4-H clubs is entirely voluntary. Each member engages in one or more agricultural or homemaking projects on which he or she concentrates effort in competition with others. In addition, groups of members form clubs of 5 to 50 members. These clubs study citizenship, stress character building and spiritual

values and engage in group recreation and community service projects. The emblem of the 4-H clubs is a four-leaf clover with an "H" on each leaf, signifying "head, heart, hands and health." In 1946 approximately 1,700,000 boys and girls ranging from 10 to 21 years in age were members of 4-H clubs in the United States.

Emerging from World War II as an outstanding patriotic youth body, with many wartime contributions, the 4-H clubs put their "head, heart, hands and health" to work in the interest of peacetime and peace-building projects. In addition to agricultural and homemaking programs, they centred their attention in 1946 around ten 4-H guideposts of balanced living and good citizenship. They took an active part in the national famine emergency campaign to aid the famished and starving among the populations of war-torn countries. They also enrolled in support of a nation-wide campaign to control and prevent juvenile delinquency.

In 1946 the National 4-H Club camp, an annual 4-H club feature until interrupted by United States entrance into World War II, was resumed and held on the campus of American university in Washington, D.C. The theme of the camp was "Know Your Government" and 4-H delegates met with various legislative committees of the congress to learn how legislation is enacted.

Many winners of county and state 4-H projects attended the 25th Anniversary National 4-H Club congress held at Chicago, Ill., during the first week in December. At this congress, sponsored annually by the National Committee on Boys and Girls Club Work, about 80 scholarships are awarded each year to qualifying local and state winners. An important feature of the Club congress is the National 4-H Club assembly. At the 1946 assembly meetings, attended by approximately 1,000 boys and girls, the discussion theme was, "Building Citizenship in a World Community." (M. L. W.)

France. France is situated in the west of Europe; bordered on the north by Belgium and Luxembourg, northeast by Germany, east by Germany and Switzerland, southeast by Italy and south by Spain; with the Mediterranean sea on its south-east coast, the Atlantic ocean on the west and the English channel and the North sea to the north. Capital, Paris; government, a constitutional republic; the first president under the newly-adopted constitution, elected on Jan. 16, 1947, was Vincent Auriol. Paul Ramadier became premier Jan. 17, 1947. Area, 212,737 sq.mi.; pop. (1936 census) 41,907,056 for metropolitan France, but estimated at 2,000,000 less in 1946 in consequence of World War II and postwar deaths resulting directly from the war. Title 8 of the constitution also provides for the establishment of the French union, which is composed of the French republic and overseas territories or associated states. Language: French; religion: Catholic, *c.* 1,000,000 Protestants.

History.—The year 1946 was marked by the resignation of Charles de Gaulle as president of the provisional government; by the voting of the new constitution to replace that of the third republic; by the election of representatives to both houses of parliament. In the field of economic activity, recovery was notable with respect to production, but the inflationary danger became greater. In international relations France persevered in its traditional policy toward Germany, much as De Gaulle had outlined it in 1944, but was forced nevertheless to bow before the refusal of the big three to separate the Ruhr and the Rhineland from Germany. In the far east the republic settled its outstanding difficulties with China over Indo-China as well as with the Annamite nationalists within Indo-China.

Political-Constitutional.—The besetting problem of politics remained governmental instability. In the year immediately

following liberation France had been governed by a theoretically non-political regime headed by Gen. De Gaulle. The general had placed himself above the play of political passions and encouraged his compatriots to follow his example. That such a conception was political mythology and not reality was vividly illustrated by the first general elections of Oct. 1945, which revealed that France was as bitterly divided as before 1939—though in a significantly different way. While the country as a whole stood far to the left of De Gaulle, the basic division was not the familiar one between left and right, but among the three leftist parties of Communists, Popular Republicans and Socialists, who together had swept the elections. Whatever prospect may have existed early in 1946 for the achievement of political harmony was destroyed by two simultaneous and interdependent developments: the deepening of factional strife within the ranks of the left, and the revival of strength by the erstwhile discredited right. The leftist groups were negatively united in repudiating the pre-1939 leaders, outlook, institutions and political behaviour. They were bitterly at odds with each other in renewing on a new terrain the old, familiar fight over the old familiar historical issues that for two centuries had split France into two large divisions of opinion. United in rejecting classical, free enterprise capitalism, they were fiercely at variance in deciding how much of the new control of economic-political-intellectual living that they all wanted in general France would accept in particular, how they were to institute this control and who was to administer it and how. And instead of contending over these issues, as right and left had so long done within the actual working of a given, concrete, capitalist-individualist state of the third republic, the leftist parties were now debating them vigorously and with increasing rancour in terms of blue-prints for the fourth republic that did not yet exist. Hence, the pivotal importance of the controversy over the new constitution. All questions of public living were consciously or unconsciously measured by the criteria outlined above; and by the end of 1946 it was an open question whether the parties of the left could sufficiently overcome their mutual distaste and distrust to work together, or whether they would fall out and allow the resurgent right a fresh opportunity to govern France.

After the first rift between De Gaulle and the Communists

RUBBLE being cleared away in Calais, France, during 1946 so that claimants could mark the boundaries of their individual properties

FRENCH FARMER, sowing seed in the early part of 1946, passes a wrecked tank lying at the side of the St. Lo-Carentan road

in the fall of 1945 a new crisis arose in Jan. 1946 over the constitution and army credits. The Socialists at this juncture sided with the Communists against the Popular Republicans in advocating a strong single-chambered assembly and a weak executive. De Gaulle, who certainly could not be accused of lacking political acumen or courage, decided that both his personal interests and the needs of the country warranted his resignation from the presidency to lead the opposition against the two Marxist groups. Three-part coalition government, however, continued after his resignation, for the Socialists on this occasion as on subsequent crises refused to work together exclusively with the Communists against the Popular Republicans.

The veteran Socialist leader, Felix Gouin, was elected president and for the next four months his stopgap government undertook the difficult, if not impossible, task of implementing his proposed policy of making heavy budgetary cuts, reactivating economic life and drafting a new constitution. For it was with a ringing criticism of De Gaulle's leadership in all of those respects that the Socialists had assumed the responsibility of power. Judging by the May 5 national referendum which was to reject the Socialist draft of the constitution and by the June 2 national elections which saw them running not even a close third to the Popular Republicans and Communists in that order, the country deemed that the Socialists, like De Gaulle, had had their opportunity and failed. In the assembly the Popular Republicans had already voted against the constitutional draft (when it was barely upheld by a 309 to a 249 vote on April 19), and had couched their objections in those legalistic terms which always conceal deeper and more vital considerations. Their objection to a strong assembly and a weak executive, and to the absence of adequate guarantees of individual rights, veiled the fear that such an assembly, dominated by Communists, could easily carry through a rapid and sweeping reorganization of social-economic relations against the middle classes in favour of the working classes. Such a prospect carried little appeal to the bourgeois liberals, so many of whom were voting for the Popular Republicans—less, it was apparent, out of acceptance of the Christian Democratic socialistic phase of the program than out

of a resigned feeling that this was the best they could salvage out of a generally bad situation.

Hence, that close vote in the assembly called the turn on the national referendum when it was held in May and the nation rejected the proposed draft. Then after an intense and rancorous electoral campaign the country went to the polls again on June 2 to elect a new national assembly that would start all over again to draft an acceptable constitution. This time the Popular Republicans gained most seats, the Communists ran a close second and the Socialists, third, obviously repudiated by the voters for an unsatisfactory constitution and much more for their failure to pull the country out of the economic and monetary doldrums. Though the Socialist high priest Leon Blum had negotiated a credit agreement with the United States just in time for the elections, the Socialist candidates failed to benefit from it.

For the next several months the Popular Republicans, headed by Premier-Pres. Georges Bidault, were in the ascendancy in the now familiar three-party governmental coalition. The centrifugal forces making for a break-up operated strongly during the summer months, which also saw an increase in the sniping tactics of De Gaulle, who was then from a protected position busily directing the fire of the political right against the Communists and Socialists and occasionally against the Popular Republicans as well. The campaign preceding the scheduled October referendum on the new version of the constitution that a committee was drawing up became heavy in September. Throwing caution to the winds, or otherwise confident of victory, De Gaulle chose Sept. 29, the very day that the constituent assembly was endorsing the new draft, to level heavy fire against the constitution as it stood, against the Marxist parties and against his old Popular Republican allies. Lest they lose him completely to the extreme right, the Popular Republicans sacrificed dignity, but gained strength, by making overtures to their general critic and by announcing loudly what they really believed in, the necessity first of accepting the constitution and then of revising it. De Gaulle intensified his attack on the eve of the referendum, castigating the draft as leading either to anarchy or dictatorship and, in either case, as boding France no good in the event of another international crisis similar to that of 1940.

The nation went to the polls on Oct. 13. Without enthusiasm, and with more than one-third of the registered voters abstaining, the country gave a narrow majority of 1,000,000 votes to the much debated constitution, which then became the legal foundation of the fourth republic. In truth the new constitution was a coat of many colours. It bestowed much power on the single assembly, which was to be elected directly, and reserved very little authority for the executive branch of the government in the president. An indirectly-elected second chamber, the council of the republic, was given only consultative power. In addition it established a French union to replace the French empire, thereby giving the colonial peoples equal rights and duties with the citizens of metropolitan France and also establishing local elected assemblies in all the territories. In view of the fact the De Gaullists and the right had won a moral victory at the referendum the leftist parties made exceedingly strenuous efforts, particularly the Popular Republicans, to recoup their losses in the forthcoming Nov. 10 elections when the country would elect deputies to the new national assembly for a five-year term. The pre-election campaign again made it clear that the Communists still wished to continue to run in political harness with the Popular Republicans even though they feared their unwelcome associates. Obviously, they would have feared them more outside of the governmental harness than within it with them. Conversely, the Popular Republicans renewed their political courtship of De Gaulle to keep him away from the embraces of the right. By not parting company they could all the better commend themselves to the electorate as the strongest single bulwark against the Communists. And for reasons similar to those employed by the Communists, the Popular Republicans preferred not to have an open breakup. Otherwise, only the De Gaullist groups (such as the Gaullist union), the Radical Socialists of Edouard Herriot and the extreme right group of the Republican Party of Liberty wished for a split in the left.

The Communists made the most notable gains of the left parties at the election, running ahead of the Popular Republicans with the Socialists a distant third. At the other end of the political spectrum the Republican Party of Liberty made spectacular strides. Looking at the results from another angle, while more than 1,000,000 fewer ballots were cast than on June 2 and almost 750,000 voters did not indicate their preferences, the Communists still gained 272,000 votes and the rightist bloc 512,000, while the Popular Republicans, the Socialists and the Radicals together lost more than 1,000,000 votes. Still, this was neither a Communist landslide nor a soul-stirring rightist comeback. As compared with Oct. 1945 the Communists obtained 28% of the total vote, or only 2% more over a 12-month period. The Communists and the Popular Republicans remained approximately equal in total votes, each getting about 5,000,000 of the 19,000,000; and the Socialists, while badly beaten, by themselves alone obtained more than the total vote of the rightist bloc. Hence, and in view also of the Nov. 24 elections for the council, the most likely governmental combination, barring unforeseen developments abroad or economic distress at home, seemed to be a three- or four-party rule. With all the disadvantages and difficulties, such a combination remained the only effective means whereby the first national assembly of the fourth republic could tackle the pressing, unresolved problems still before France.

Social-Economic.—During 1946 France almost caught up with the prewar figures of production. At the same time improvement in food, clothing and housing was paralleled in better health and in a greatly increased number of births, which rose to 950,000 or about 50% more than in 1938. On the other hand the inflationary gap widened considerably, especially after the spiral price and wage rise in July. To close it by spurring pro-

SECRETARY OF STATE JAMES F. BYRNES, signing the agreement whereby the United States made a \$1,370,000,000 credit available to France, on May 28, 1946. Present during the ceremony at Washington, D.C., were U.S. Secretary of the Treasury Fred M. Vinson (left), French Ambassador Henri Bonnet (second from right) and Léon Blum, chief French negotiator

duction the government set up a planning council, headed by the able and veteran Jean Monnet. Between late spring and early autumn the 1,200 members of the council—engineers, businessmen, workers, farmers, representatives of the government—drew up a five year plan covering two-thirds of French economic life and calling for a 25% increase in productivity over 1929, which was the best prewar year. It was a realistically conceived program, comprehensive in scope and well-integrated and full of promise for a semisocialized and democratically-administered economy that could do much to improve the badly-depressed living standards of the French people. Meantime, it is worthy of note that the larger part of French economy remained non-nationalized. In addition to the already state-controlled Bank of France, leading credit banks and transport, the following enterprises were also nationalized in 1946: electricity and gas, coal mining as a whole, steel and approximately 65% of the insurance business. Everything else remained private. There were few innovations during the year in social legislation, and the year was marked rather by an extension of social security legislation, old age pension system and employee representation.

Nonofficial estimates towards the close of the year placed industrial production at 89% of 1938 and agriculture at 80%. Both exports and imports spurted upward toward the close of the year. The year's total, however, remained low, particularly in exports which averaged only one-sixth of the imports. At the end of October the trade deficit stood at \$104,000,000. In this sense France, which had already lost much of its gold holding abroad, continued to live off capital and loans. Economists estimated the total loss of French wealth in consequence of World War II and German occupation at between 40 and 45% of the country's prewar total. A necessary fillip to French economy came from the successful conclusion of Leon Blum's mission to the United States. On May 28 he negotiated a broad Franco-U.S. trade and financial agreement with the following provisions: \$1,370,000,000 in U.S. credits for French reconstruction; the cancellation of about \$1,800,000,000 worth of consumed lend-lease material and the reduction to a selling price of \$300,000,000 of about \$1,400,000,000 worth of war surplus material, also to be employed for French reconstruction. Unfortunately, these credits had been used up by the end of the year, and the French government was anxiously awaiting the result of its application to the International bank for additional credits of \$500,000,000.

The following selected figures illuminate some of the progress and the difficulties of reconstruction: coal production was high at 111% of the prewar figures. Yet the coal situation, particularly on the eve of the winter of 1946-47, was serious because of the fact that France was importing so little from abroad—39% of the prewar average—and considerably less coal was being received from the Ruhr than France was entitled by agreement to receive. The coal shortage, aggravated by exceptional drought and also by extraordinary power consumption, had created a severe electric power crisis by the end of the year. There was almost full recovery with respect to the clearing of rubble, mine craters and land mines. Considerable progress was made in the production of building materials and housing, much of the latter on a temporary basis, and with comparatively slight use of prefabricated material; of permanent new housing, there was very little. The textile industry of France hit its old stride and was using new materials and designs. Because of unprecedented needs the accelerated glass production remained insufficient; France also remained short of bottles and bulbs, but the situation was vastly improved over the previous year. The heavily-damaged oil refineries were about 50% normal. Restoration of railway traffic continued without abatement, thanks to the great repairing or reconstructing of bridges, viaducts, rails, coaches and locomotives. The latter numbered 10,384 in 1946 as compared with 13,400 before the war. In automotive production, mainly trucks and service vehicles, production was up to 70% of 1938. But water traffic, especially international merchant marine, was low because, among other reasons, of heavy war destruction. The greatest shortage, apart from housing materials, remained manpower, and France was not only giving the 700,000 German war prisoners an opportunity to settle permanently in France but had set up a ten-year immigration program that set its sights upon 3,000,000 additional citizens. But it was feared that the possible departure of close to 100,000 German and Polish workers might cause a serious labour shortage in the coal pits during the 1946-47 winter.

As elsewhere, so in France, augmented production was accompanied by disproportionately higher prices and living costs. Government-sponsored efforts to keep prices and wages in line had failed and industrial and food prices were rising steadily. Despite sharp budget cuts, elimination of some governmental subsidies and plans to remove the others, and proposals to trim the bureaucratic inflation sharply by cutting down on the more than 2,000,000 civil servants, the deficit remained menacing at the end of the year. Bank note circulation by November was 22% higher than at the beginning of the year. The uncertainty over the financial and economic future was reflected in the short selling of the franc and in the black market operations where it was exchanged for considerably less than the fixed legal rate.

International.—The year saw no modification of the existing French diplomatic policy, which was not to seek to dominate the continent (and Germany) alone, but to serve as a point of equilibrium between the United States and Great Britain on the west and the U.S.S.R. on the east. But France had to reconcile itself to the reality that none of the Big Three supported the French policy of detaching the Ruhr and the Rhineland politically from Germany; and even more bitterly, France had to watch the wheel swing full circle with the U.S.S.R. taking substantially the same position as the United States (albeit for different reasons) in wishing the future political centralization of Germany as well as its increased economic productivity. As far as Great Britain and the Ruhr were concerned, France bowed to the inevitable by midsummer when it became evident that British Foreign Minister Ernest Bevin would not pay the price the French asked in return for a British-French understanding. With respect to the United States, the steps taken by Secretary of State James Byrnes between early spring and late fall to reach agreement with the U.S.S.R. over Germany without at the same time depriving France of assurances of continued U.S. military surveillance of Germany told the story. On Dec. 2 an Anglo-U.S. pact was signed for the economic merger of the U.S. and British zones of occupation in Germany, and reports persisted, though without corroboration, that a U.S.-soviet agreement was being reached, whereby the United States agreed to allow more reparations for the U.S.S.R. (including additional coal from the Ruhr) in return for soviet participation in the economic merger of the German zones and assent to a higher productive level for Germany than fixed at Potsdam. Though in the course of the soviet-U.S. rivalry France was promised U.S. support of French claims on the Saar, the prospect of a revival of Germany's economic and hence military potential was not a cheering Yuletide gift to France from its allies.

Elsewhere in the French union, France reached an agreement with China on Feb. 28. A treaty was signed settling the long dispute over the 100,000 Chinese troops that had been occupying the northern half of Indo-China. In order to have them withdraw, and thus indirectly remove their moral support of the Annamite nationalists, France gave up its extraterritorial rights and other special concessions and opened trade opportunities for the Chinese in the southern provinces of Indo-China. Early in March the French republic also came to terms with the Indo-Chinese nationalists by signing an agreement with the Viet-Nam government, recognizing it as a free government within the Indo-Chinese federation and the French union. Should this agreement be peacefully enforced in the future, it might serve to weave a new pattern of relations in southeast Asia, where dwell one-third of the inhabitants of what was called the French empire. (See also ANTI-SEMITISM; FRENCH COLONIAL EMPIRE; INTERNATIONAL LAW.) (L. Gy.)

Franco, Francisco (1892—), Spanish soldier and statesman, was born on Dec. 4 at El Ferrol, Galicia. For his early career see *Encyclopædia Britannica*. In the early days of axis victories in World War II Franco affirmed Spain's solidarity with Germany and Italy in the struggle against "bolshevism." When Allied arms began to triumph, he hastened to profess his neutrality and in 1945, following the

collapse of Germany, he declared (May 20) that Spain was not a "dictatorship." Then on Oct. 22 he issued a "bill of rights" which included freedom of worship and expression and the right to petition, provided these liberties did not run counter to the "fundamentals of the state."

The debates on Spain at the United Nations Security council in New York in April 1946, where most of the delegates were agreed on the necessity of condemning Franco's regime, although not on methods to oust him from power, led the Spanish premier to declare before the opening of the cortes (May 14, 1946), that Spain was a "free Christian democracy"; in the same breath he denounced communism and foreign intervention. Franco, whose Falangistas organized an anti-United Nations mass demonstration in Madrid, Dec. 9, attacked the U.N. for attempting to "isolate" Spain. Three days later (Dec. 12) the U.N. General assembly passed a resolution asking its member states to withdraw their envoys from Spain and bar Spain from U.N. participation. (See also SPAIN; UNITED NATIONS.)

Frank, Hans (1900-1946), German jurist and politician, was born May 3 in Karlsruhe. A student of economics and jurisprudence, he attended the universities of Munich, Vienna and Kiel. In 1930 he joined the nazi party and later became reichstag president and commissioner of justice in the nazi administration. In 1933 he was named Bavarian state minister of justice. Through his office of president of the Academy for German Law, Dr. Frank accommodated German law to fit the needs of nazism. After the collapse of Poland, he was appointed supreme chief of Poland's civil administration. In 1942 the Polish government-in-exile charged Frank with ordering the execution of 200,000 Poles, suppression of Polish citizenship, confiscation of Polish property, enslavement of hundreds of thousands of Polish workers who were shipped to Germany and of herding all remaining Jews into ghettos. Dr. Frank was captured by U.S. army troops on May 4, 1945, and was indicted for trial before the International Military tribunal at Nuernberg. He was found guilty of war crimes and crimes against humanity and on Oct. 1, 1946, was sentenced to hang. Sentence was carried out Oct. 16, at Nuernberg, Germany.

Frank, Karl Hermann (1898-1946), German politician, was educated at Prague university and was a bookseller before he turned to politics. A Sudeten "irredentist," Frank agitated for the return to the reich of the German-speaking provinces of Czechoslovakia, and joined the Sudeten German party when it was first organized. Rising to the party directorate, he represented the Sudeten Germans in the Czechoslovak parliament (1935-38). After Hitler annexed the Sudetenland following the Munich agreement of 1938, the party was absorbed by the nazis, and the following year Frank was named state secretary to the reich protector for Bohemia and Moravia, and concurrently held the rank of minister. After Reinhardt Heydrich, reich protector of Bohemia and Moravia, was assassinated by Czechoslovak patriots in 1942, Frank ordered the execution of the male population of the villages of Lidice and Lezaky. He surrendered to the U.S. army near Pilsen on May 9, 1945. Questioned at Wiesbaden, he admitted signing the decree ordering the execution of all persons (together with their families) who assisted in the attempt on Heydrich's life, or who failed to report the identity or whereabouts of the assassins. He stated that on the same day, he had received instructions from Hitler's headquarters to execute 30,000 to 40,000 politically suspect Czechs as a reprisal for the slaying. Frank insisted that he flew to Berchtesgaden to protest the order and that while he was in Berlin the massacre of Lidice was carried out by a special execution company sent from

Berlin. Convicted by a People's court in Prague for the Lidice massacre as well as for other war crimes, he was hanged in the Pankrac prison courtyard on May 22.

Freer Gallery of Art: see SMITHSONIAN INSTITUTION.

French Colonial Empire.

Under this heading are grouped the overseas *départements*, the colonies (*territoires d'outremer*), the protectorates and the mandated territories, the total area of which (excluding Syria and Lebanon) is 4,579,000 sq.mi. and the total population (est. Dec. 1939) 67,591,000. Certain essential information on the composing parts of the French colonial empire, or *France d'outremer* as it is officially called, is given in the table.

History.—Developments in France's colonial policy during 1946 reflected the rising tide of nationalism in the majority of its overseas territories. In January Marius Moutet was appointed minister of *France d'outremer*. Two months later the special laws applying to natives were abolished by decree. Guadeloupe, Martinique, French Guiana and Réunion were created *départements* of metropolitan France as from Jan. 1, 1947. In March it was announced that a new colonial fund was to be started. The new constitution that was adopted by the French people on Oct. 13 provided that the various colonies should be federal units of the French union and that natives of the colonies should be citizens of the French union but not enjoy full French citizenship. The natives, however, were granted full equality with French citizens before the law.

Algeria.—The food situation in the three North African *départements* was very grave in the spring and by May rain had spoilt a promising grain crop. Algeria was nevertheless able to export to France wine, vegetables and wheat during the year. An amnesty was granted in March to those Moslems taking part in the troubles of May 1945. The Manifesto party, under Fehrat Abbas, in the elections on June 2 won 11 out of the 13 seats available to Moslems. Fehrat Abbas and the other delegates proceeded to Paris the same month to take their seats in the constituent assembly. A debate on Algeria in August, in which they took an active part, resulted in a statute being voted for Algeria. This statute, not to come into immediate effect, provided for a highly decentralized regime, with a wide franchise which would elect an Algerian political assembly. The assembly would consist of 90 members, half of them Moslems. Members would be elected for six years by universal suffrage, with elections for half the number of members every three years. The assembly would have power to propose new laws; it would share with the governor-general the initiative in financial matters and would have authority over taxes and communications. In the new French constitution Algeria was allotted 15 seats in the national assembly. In the elections on Nov. 10 the *Fédération des Elus Musulmans* won 8 seats, the Communists 2 and the supporters of Messali Hadj, the leader of the extremist Nationalist party, 5. It had earlier been decided that Arabic was to be taught compulsorily in all schools and that social security measures in force in France were to be applied in Algeria. Messali Hadj was released from Brazzaville in July but did not obtain permission to return to Algeria until October. There was an earthquake in February in the *département* of Constantine which caused more than 200 deaths. The last British and U.S. troops left in August.

Tunisia.—The harvest was moderately good but it was still necessary to import grain. The export of phosphates had increased after 1945. Municipal elections were held in April. The Tunisian nationalist party *Destour*, although banned, was by May working actively underground, led by Habib Bourguiba. Its principal aim was the complete independence of Tunisia and its adherence to the Arab league. A demand by Sheikh Mohammed Chouicha for wider liberties for Tunisians evoked a statement by Gen. Charles Mast that France would consider reasonable changes in the protectorate. A plan to give increasing responsibility to Tunisians was then drawn up. This provided that Tunisians should have an equal share with the French in the Tunisian government. Meanwhile, a state of martial law continued, all papers were strictly censored and no meetings were allowed to be held. A general strike was called as a protest against the report of the Anglo-American Committee on Palestine and another strike was called in August as a protest against the arrest of *Destour* leaders.

Morocco.—The harvest was good but the yield not so great as in former years. Proposals for a loan to further the modernization and industrialization of the country and the suggestion of reforms aroused protests among French residents. These included an agricultural program, the development of coal and lead mining and the opening of French high schools to Moslems, enabling them to qualify for administrative posts.

French West Africa.—There was a serious strike in January of all essential services. The strikers called for the abolition of differences in wages and allowances based on racial discrimination. The strike ended early in February after spreading to the whole of Senegal. In September discontent with a chief at Bob-Dioulasso, near Dakar, resulted in a riot.

Madagascar.—In May there was a nationalist demonstration at Antananarivo and a dock strike. Two of the nationalist leaders, Ravaohangy and Raseta, expressed their faith in French promises to treat their colonies liberally but stated that Madagascans wished to administer themselves and asked that a referendum should be held on the future of the island. In June it was announced that all public posts would be opened to Madagascans.

French India.—Municipal elections were held in April and cantonal elections in May. An application by the Indian Congress party for permission to start a branch was received with caution. Pandit Jawaharlal Nehru stated in August that the people of French India must decide their fate for themselves. Zivarattinam, the representative from French India in the constituent assembly, complained of the authoritarian methods of the governor but stated that the people remained loyal in spite of propaganda.

Indo-China.—France officially resumed control of Indo-China on March 4, when British naval and military forces transferred to the French authorities responsibility for law and order, with the exception of Tongking, which had been allotted to the Chinese. The same month the French signed an agreement with China on the evacuation of Chinese troops from north Indo-China. When French troops landed in Hanoi, however, there were clashes with Chinese forces and it was not until August, after urgent representations to the Chinese government, that the Chinese troops were finally evacuated.

A delegation from Cochinchina was received by Moutet in Paris in May following demonstrations the previous month in Cochinchina in favour of autonomy. A convention was signed in June between France and Cochinchina by which the latter was recognized as an independent republic in an Indo-Chinese federation within the French union. The new republic would have control over its army and finances. A provisional government was set up under Dr. Nguyen van Thinh and elections to a constituent assembly were to be held. In November the government resigned and Dr. van Thinh committed suicide.

Cambodia's autonomy was recognized by France in a treaty signed on Jan. 6, the French resident being subsequently withdrawn in recognition of this autonomy. The ruler of Cambodia, King Norodom Sihanouk, arrived in France on a visit early in May and returned toward the end of June.

Viet-Nam (Tongking and Annam) was recognized by France as a republic on March 6 under its leader Dr. Ho Chi-Minh. A round table conference of all the provinces comprising the prospective federation of Indo-China broke down at Dalat over the independent status of Cochinchina which the Annamese had hoped to see included in Viet-Nam. A delegation from Viet-Nam led by Ho Chi-Minh visited Paris and took part in a conference at Fontainebleau in July. The following month

NATIVES OF FRENCH MOROCCO receiving free X-ray tests during 1946. This was part of a far-reaching health program of the French government to cut down tuberculosis and related illnesses

the conference broke down on the status of Cochinchina, while Annamese feeling was aroused by the French bombing of the village of Bac Ninh while negotiations were proceeding. A *modus vivendi* was finally reached and signed on Sept. 14 which left all the outstanding questions unresolved but granted French cultural establishments the right to function freely and provided priority to French advisers and technicians. Although an official cease fire was ordered on Oct. 29, serious fighting between French and Annamese continued sporadically throughout the year. In November a government was formed with Ho Chi-Minh as prime minister, Thuc Kang as minister of the interior, Nguyen Giap as minister of national defense, and Pham van Dong as minister of national economy. But on Dec. 19 the Annamese, suspicious of the French intentions, started open warfare against the French garrisons in Tongking. The French government ordered another 75,000 troops to proceed to Indo-China. Fighting continued with increasing intensity during the rest of the month. (See also PACIFIC ISLANDS, FRENCH; SYRIA AND LEBANON.)

(D. K. M. K.)

French Possessions in America.—The four colonies of France in the western hemisphere fall into three regional groups: (1) The islands of St. Pierre and Miquelon at the mouth of the Gulf of St. Lawrence; each has certain dependent islets; respective areas: 10 sq.mi. and 83 sq.mi.; est. pop. of both: 4,000; (2) the French West Indies, consisting of the two colonies of Martinique and Guadeloupe, the latter with five small island dependencies; respective areas of Martinique and Guadeloupe: 427 sq.mi. and 687 sq.mi.; est. pops., 260,000 and 310,000; (3) French Guiana, a mainland colony in the northeastern part of South America, including French Guiana proper, a narrow coastal strip, and the hinterland dependency of Inini; area: 34,740 sq.mi.; est. pop.: 37,000. Capitals of the four colonies (with pop. ests.), respectively, are St. Pierre (3,400), Fort-de-France (52,051), Pointe-à-Pitre (44,551) and Cayenne (11,704). The racial composition in St. Pierre and Miquelon was largely French or of French descent, in the French West Indies and French Guiana it was almost entirely Negro and mulatto. The language of all the colonies was French except that the dialect Creole and various patois are used in the West Indies and Guiana. French-appointed governors headed the administrations of all four colonies; the French ministry of the interior was scheduled to assume more direct control of the two West Indian colonies beginning in Jan. 1947.

History.—Little that was noteworthy occurred in St. Pierre and Miquelon during the year 1946. Martinique, Guadeloupe and French Guiana were drawn into closer co-operation with colonial possessions of other powers in the Caribbean area in 1946. They were represented at the second Caribbean conference, meeting at St. Thomas in the (U.S.) Virgin Islands Feb. 21–March 13. When plans for the reorganization of the Anglo-American Caribbean commission into the expanded Caribbean commission were perfected in July, it was announced that the deputy secretary general would be either French or Dutch and that one assistant would be French. The French West Indies were also expected to help staff the secretariat established at Port of Spain, Trinidad. The French government announced early in April that Martinique, Guadeloupe and French Guiana were thereafter to be considered as departments of metropolitan France. Maj. Charles A. Péan of the French Salvation army announced in New York city April 10 that he was designated to begin a three-year program of liquidating the French penal colony on Devil's Island, off French Guiana; he reported that 5,127 prisoners were confined there and that 2,800 others had completed their terms but were unable to leave because of lack of transportation.

Trade.—Martinique rum exports in 1945 were 62,000 hectoliters valued at 177,000,000 francs (1944: 65,700 hl. valued at 88,000,000 francs). Total quantity imports for Martinique in 1945 were 57,000 metric tons valued at 461,300,000 francs; exports totalled 56,800 tons valued at 450,700,000 francs. Guadeloupe imports in 1945 were 49,300 tons valued at 401,600,000 francs and exports were 126,500 tons valued at 948,200,000 francs. Imports into French Guiana in 1945 totalled 9,400 tons valued at 126,800,000 francs; exports were 1,600 tons valued at 45,400,000 francs. Imports into St. Pierre and Miquelon in 1945 were 19,600 tons valued at 44,500,000 francs; exports were 7,600 tons valued at 49,900,000 francs.

Production.—Banana production in Guadeloupe in 1945 was estimated at 30,000 metric tons; sugar production in the same year was 28,000 tons but the estimate for 1946 was 40,000–45,000 tons. Rum production in Martinique in 1945 was about 24,000,000 l.; the estimate for 1946 was 25,000,000 l. Alcohol production in Guadeloupe in 1945 was 55,000 hl.

French Literature. The influence of philosophical speculation on the creative processes of many important French writers was characteristic of the year 1946, and it was generally conceded that whereas after 1918 the principal problems posed were of a moral order, the crisis of the post World War II period had assumed a metaphysical, not to say religious, character. In this connection it was to be noted that except for Louis Aragon and Paul Eluard, writers were opposed, each in his way, to the materialistic concepts of Marxism. Both Catholics and Marxists, however, made common cause in condemning *la littérature noire*, sometimes called *miserabilia*, as exemplified by the works of Jean-Paul Sartre and his friends. The Communist weekly, *Action*, went even further,

launching an attack designed to destroy the great vogue of the works of Franz Kafka in France. "Should Kafka be burned?" was the theme of an *enquête* that aroused considerable discussion and not a little indignation among liberal writers.

It would be difficult to say to what extent interest in the attempt on the part of the philosophically-minded *avant-garde* to open up new frontiers of thought was responsible for a certain indifference on the part of both critics and public to what was not only an abundant literary output but undoubtedly, in other less preoccupied years, would have been considered of generally excellent quality. Even such works as André Gide's *Thésée*—an autobiographical adaptation of the Greek legend and considered by many to be his "literary testament"—was given little attention other than that of respectful consideration. The following titles are perhaps significant: *Tableau de la philosophie française*, by Jean Wahl; *L'existentialisme chrétien* (introduction by Soeren Kierkegaard), by R. Jolivet; *L'homme à la découverte de son âme*, by C. G. Jung (translation); *Jésus en son temps*, by Henry Daniel-Rops; *L'éducation sexuelle et l'évolution religieuse*, by Pierre Gordon; *Les degrés du savoir*, by Jacques Maritain; *L'existence*, by Albert Camus, Etienne Gilson, et al.; *La philosophie religieuse de Bergson*, by Lydie Adolphe; *Introduction à l'étude de Platon*, by Alexandre Koyré; *Retour à l'éternel*, by Robert Aron; etc.

Among the prize-winning novels, *Les grandes vacances*, by Francis Ambrière and *L'univers concentrationnaire*, by David Rousset (Prix Goncourt and Prix Théophraste-Rénaudot 1940, reserved for the work of returned prisoners-of-war) were widely praised for their remarkably faithful, comprehensive account of life in German prisoner and concentration camps. *La vallée heureuse*, by Jules Roy (Prix Théophraste-Rénaudot 1946) was also favourably received and its author, who flew with the RAF during the war, was mentioned as a worthy successor to the mantle of the late Antoine de St. Exupéry. Romain Gary, author of *Education européenne* (Prix des Critiques, 1945) published a highly original second novel, *Tulipe*. Other titles were: *Tous les hommes sont mortels*, by Simone de Beauvoir; *Les armes de la nuit*, by Vercors (Jean Bruller); *L'homme foudroyé*, by Blaise Cendrars; *Le signe du taureau*, by Henri Troyat; *Le dernier des métiers*, by Jacques-Louis Bost; *Le dernier village*, by André Chamson; *La vie des morts*, by Agnès Chabrier (Prix des Critiques, 1946). André Malraux brought out an anthology of portions chosen by himself from his own works under the title, *Scènes choisies*. Jules Romains, who became a member of the Académie Française, completed the 24th volume of his long work entitled *Les hommes de bonne volonté*. The two volumes of Resistance memoirs published under the title, *Mémoires d'un agent de la France libre*, by Rémy (Gilbert Renault), were a valuable contribution to this subject.

In the domain of poetry, Henri Michaux's *Epreuves*, *Exorcismes* and René Char's *Le marteau sans maître* and *Feuillets d'hypnos* confirmed the rare gifts of both poets. Michaux also contributed hitherto unpublished texts to a de luxe volume entitled *En pensant au phénomène de la peinture*. Other titles chosen with difficulty from a distinguished list were: *Les sept psaumes de la pénitence*, by Paul Claudel; *Sodome*, by Pierre Emmanuel; *Poésie ininterrompue*, by Paul Eluard; *Ecce homo*, by Georges Ribemont-Dessaignes; *Liberté d'action*, by Henri Michaux; *Le siège de l'air*, by Hans Arp; *1939-1945*, by Jules Supervielle; *Paroles*, by Jacques Prévert; *Vingt-cinq et un poèmes*, by Tristan Tzara; *Aurora*, by Michel Leiris. A new volume of the complete works of Lautréamont (Isidore Ducasse) was edited and commented on by Philippe Soupault, and Georges Duhamel edited an *Anthologie de la poésie lyrique en France*. Léon-Paul Fargue was awarded the annual prize of the Ville-de-Paris.

It would be impossible in the framework of this account to do justice to the large number of brilliant essays that were published. Mention should be made, however, of such volumes as: *Lettres à un am allemand*, by Albert Camus; *Baudelaire*, by Jean-Paul Sartre; *Entretien sur des faits divers*, by Jean Paulhan; *Sur Nietzsche*, by Georges Bataille; *Les impostures de la poésie*, by Roger Caillois; *Journal*, by Charles Du Bos; *Sans pouvoirs*, a posthumous political commentary by Jean Girardoux.

As for the theatre, Jean-Paul Sartre's Resistance play: *Mort sans sépulture*—followed by the same author's *La putain respectueuse*, a one-act play based on the colour problem in the United States—was variously received. Armand Salacrou's play, *Les nuits de la colère*, which treats of courage and cowardice among ordinary citizens during the German occupation, was generally considered to offer a more authentic account of the complexities of that period. *Roméo et Jeanette*, by Jean Anouilh, and *L'aigle à deux têtes*, by Jean Cocteau, were other events of the dramatic season. The film based on André Gide's early work, *La symphonie pastorale*, was chosen the best French film of the year at the International Film festival which took place in Cannes. Jean Cocteau directed his own film version of *La belle et la bête*.

To the long list of existing reviews were added a dozen new ones among which especial mention should be made of Georges Bataille's *Critique*, *Les 4 vents* (romantic-surrealist), edited by Henri Parisot, and *Troisième convoi*, the latter being the first manifestation of an emerging younger group that included Jean Maquet, René de Solier and a number of new talents. Such reviews as Sartre's *Temps modernes*, *Labyrinthe*, *Esprit*, *L'arche*, *La nef* and *Fontaine* continued to constitute brilliant vehicles of rapid exchange of ideas. (M. JOL.)

Frick, Wilhelm (1877-1946), German politician, was born March 12, in the Palatinate and was a student of the universities of Munich, Goettingen and Berlin. His affiliations with the nazi party started at the time of the Munich beer hall putsch in 1923 (he was implicated in the uprising) at which time he was attached to the Munich police presidency. He later became minister of the interior and minister of public instruction in Thuringia where Adolf Hitler acquired his German citizenship in 1930 by a sham appointment to the post of police commissioner. When Hitler assumed the chancellorship of Germany in 1933, he brought Frick to Berlin as his minister of interior. In that capacity, Frick ruthlessly suppressed opposition parties, trade unions, the press and the Jews. He was captured by the U.S. 7th army on May 7, 1945, near Munich and was brought to trial as a war criminal at Nuernberg. On Oct. 1, 1946, the International Military tribunal found him guilty of crimes against the peace, war crimes and crimes against humanity and sentenced him to death by hanging. Sentence was carried out Oct. 16.

Friends, Religious Society of. Founded nearly 300 years ago in England by George Fox, the Religious Society of Friends (Quakers) maintains as its central doctrine the Inward Light or Divine Seed, which can lead its faithful followers into a way of life characterized by simplicity, Christian love and peace. The society was composed in 1946 of 53 yearly meetings and annual

QUAKER TRANSPORT UNIT TRUCK among the ruins of Caen, France. The unit was organized in 1946 to provide dependable transport of supplies to communities where such service was lacking

conference groups in 30 countries, with an approximate membership of 164,000. About 115,000 were in the U.S. and Canada, and about 22,000 in the British Isles. New yearly meetings came into existence during the year in South Africa and in Kenya colony, East Africa.

Friends on the continent of Europe began to resume their corporate life, which had been shattered by the war. At a conference of German Friends, held in Feb. 1946, the extent of their pacifist witness in prison, in concentration camps, and in relief work first became apparent. Publication of their periodical *Der Quäker*, suspended in 1942, was resumed late in the year. Other continental Quaker groups revived and addressed themselves to urgent problems relating to education, relief work, the basis of membership and relationship to state churches. Word came from Japan of the survival of a small Quaker group there and of meetings for worship held under military occupation. The interim executive of the Friends World Committee for Consultation met in England in April and again in August and laid plans for a full meeting of this international committee (the first after the outbreak of the war) in 1947 and a world conference of Friends in 1948 or 1949.

In the U.S. the trend toward unity continued. The two Philadelphia yearly meetings (Orthodox and Hicksite) approved a plan for the creation of a general meeting to include all members of both groups, and the first sessions of the new body took place in November. Twenty-seven Quaker schools and colleges (representing all branches of Friends) sent delegates to a conference on education held at Earlham college, Richmond, Ind., in November; a major topic of discussion was the educational value of the volunteer work camp, in the development of which Friends had pioneered. The American Friends Service committee continued to operate weekend, summer, and year-round work camps as well as student-in-industry projects and volunteer units in mental hospitals and reformatories. British and American Friends devoted much energy to an effort

to educate public opinion on the dangers inherent in peacetime military conscription.

Although wartime conscription was still in force and Quaker conscientious objectors continued to be drafted or imprisoned, certain activities of Friends, undertaken to provide alternative service for conscientious objectors, were discontinued. The Friends Ambulance unit, a British Quaker organization with personnel drawn from Great Britain, Canada, New Zealand, and the U.S., was officially disbanded at the end of June, although many of its members remained in the field to carry on medical relief and to initiate rehabilitation projects in India and China. Friends' participation in the administration of Civilian Public Service, the U.S. alternative-service program for conscientious objectors, came to an end on March 2, the men still in camp coming under direct government control. Not a few Quaker conscientious objectors, released from camps, mental hospital units and prison, volunteered for foreign relief work, from which they had been barred during the war by congress.

The appalling needs of millions in Europe and Asia for food, shelter, clothing and medical aid made a powerful claim upon the sympathies, the energies and the financial resources of Quakers. The Friends War Relief Service in England and the American Friends Service committee in the U.S. provided channels through which the concern of Friends and many others to alleviate suffering could be carried out. Quaker relief workers helped to rebuild houses in Finland, Poland and Italy. A Quaker Transport unit was organized, with headquarters in France, to facilitate the distribution of food and building supplies in the face of the general breakdown of transportation throughout Europe. The main emphasis of the work in France shifted during the year from relief to reconstruction.

In central Europe the need for direct relief remained and indeed grew steadily greater. British and American Friends worked together in the British Zone of Germany, distributing food and clothing to starving people living in unheated houses. In the U.S. and French zones Quaker relief supplies were, by decision of military government authorities, distributed by indigenous agencies. Food, blankets, and medicine were sent into the soviet zone for 60,000 undernourished children expelled from East Prussia, Silesia and Poland. Food and vitamins were distributed by Quaker workers in Austria and Hungary.

In China, where the Friends Ambulance unit had hauled medical supplies and operated civilian hospitals for six years, the emphasis during 1946 shifted to rehabilitation, the workers being concentrated in Honan province. British and American Quaker workers in India supervised the distribution of milk to needy groups living in the shadow of famine. An American Quaker was one of two commissioners allowed to dispense relief supplies from American private agencies in Japan. In all their ministry to suffering humanity Friends sought to give expression to the spirit of reconciling love which takes away the occasion of all wars. (See also CHURCH MEMBERSHIP.)

(F. Ts.)

Fritzsche, Hans (1899-), German journalist and broadcaster, was a member of Moeller van den Bruck's "Young Conservative" movement that started after Germany's defeat in World War I. Van den Bruck's program emphasized hatred for England and "sublimation" of the doctrine of the class struggle by that of war. Fritzsche started broadcasting in Sept. 1932 as a news commentator with a daily program called "Hans Fritzsche Speaks." That same year he was named head of the Wireless News services, a reich government agency. When the agency was incorporated into Goebbels' propaganda ministry on May 1, 1933, Fritzsche joined the nazi party and became head of the home press division of the

propaganda ministry in 1938. By Nov. 1942 he had become chief of the ministry's radio division and plenipotentiary for the political organization of the greater German radio. Throughout his association with the propaganda ministry Fritzsche was merely a subordinate to Goebbels and had no hand in formulation of policy. Captured in Berlin by soviet troops in May 1945, he was indicted at Nuernberg Aug. 29, 1945, to stand trial as a war criminal. While the international military tribunal acknowledged that Fritzsche sometimes made "strong statements of a propaganda nature," it did not hold that they were intended to incite the German people to commit atrocities.

He was found not guilty under the terms of the indictment, Oct. 1, 1946, and was given his freedom.

Fruit. The 1946 fruit production of both citrus and deciduous fruits in the United States reached the highest volume in history. The combined total of 13 fruits was one-sixth more than the harvest of 1945 and nearly one-third more than average. The total of 15 fruits, including only commercial apples, was estimated at 17,388,000 tons compared with 16,816,000 tons harvested in 1944, the previous record year. New high records were made for oranges, grapefruit, peaches, pears, cherries and plums, with near records for several other crops. Prices were firm during the early part of the year and advanced when controls were removed but were lower in the late months when the large crops began to reach the markets.

Apples.—The apple production of the United States was about average in 1946 after the very poor crop of 1945. The total commercial crop was estimated by the U.S. department of agriculture at 121,520,000 bu. compared with the small crop of 68,042,000 bu. harvested in 1945 and an average of 120,962,000 bu., 1935-44. Production in the eastern and central states made up 61% of the U.S. total in 1946 whereas it accounted for only 33% in 1945. Production in the western states was 3% above 1945 and 6% above average. The crop of summer varieties was 20% larger than in 1945, fall varieties were twice the 1945 production and winter sorts nearly two-thirds larger than in 1945. The normal distribution is summer apples 6%, fall 15% and winter 79% of the total crop. In the east New York, which had a very small crop in 1945, produced almost an average crop. Virginia recovered to a total crop above the average. The central states recovered to near-average crops. On the Pacific coast Washington harvested an above-average crop. Losses from insect damage were lighter because of the widespread use of DDT. Oregon and California had about average crops.

Prices of eastern apples were generally lower in 1946 than in the short crop year 1945. The U.S. average in Nov. 1945 was \$3.08 per bu. and \$2.35 per bu. in Nov. 1946. Western apples opened the season at higher prices than a year earlier, when ceilings were in effect, but began to decline in early fall. Shipments were much larger than a year earlier as a result of the larger crop and consumption was at a high level. About 25 lb. per capita was consumed compared with an average of 30 lb., 1935-39. By Oct. 1, 1946, cold-storage holdings were more than twice the quantity held a year earlier, or 9,368,000 bu., and also more than the average. A larger part of the stored stocks were in the eastern states, while in 1945 about a third was held in the western states.

Table I.—U.S. Apple Production in Leading States, 1946 and 1945

State	1946	1945	State	1946	1945
Washington . . .	31,684,000	26,900,000	Montana . . .	1,872,000	689,000
New York . . .	15,390,000	2,160,000	Massachusetts . .	1,784,000	410,000
Virginia . . .	13,680,000	3,900,000	North Carolina . .	1,716,000	252,000
Pennsylvania . .	9,360,000	2,470,000	Indiana . . .	1,320,000	828,000
Michigan . . .	7,875,000	1,250,000	Connecticut . . .	1,238,000	511,000
California . . .	7,452,000	10,568,000	Missouri . . .	1,168,000	817,000
West Virginia . .	4,550,000	1,950,000	Colorado . . .	1,100,000	1,217,000
Illinois . . .	3,965,000	2,684,000	Wisconsin . . .	996,000	316,000
Oregon . . .	3,315,000	2,882,000	New Mexico . . .	909,000	472,000
Ohio . . .	3,078,000	984,000	Delaware . . .	825,000	308,000
New Jersey . . .	2,310,000	1,295,000	Maine . . .	704,000	132,000
Idaho . . .	1,891,000	2,465,000	Arkansas . . .	704,000	312,000

Apricots.—The 1946 apricot crop of California, Washington and Utah amounted to 343,400 tons, compared with 193,600 tons in 1945 and an average of 235,535 tons, 1935-44. California produced 312,000 tons, 44% above the average. Washington grew 26,000 tons and Utah 5,400 tons. A large part of the California crop was canned while the part dried was lighter than usual for such a large crop.

Avocados.—The production of avocados declined in 1946 in both California and Florida where the crop is grown. The total was 16,400 tons compared with 22,400 tons harvested in 1945 and an average of 14,153 tons. California production dropped to 14,800 tons from 19,200 tons in 1945 and Florida to 1,600 tons from 3,200 tons. Prices were high in 1946 after controls were removed.

Bananas.—The banana supply increased slowly through the year but continued to be far below demand. The ship shortage was the principal

handicap to trade but production was also restricted in several Central American countries. Mexico supplied about 20,000,000 bunches and other countries additional amounts to make up a supply about half of prewar demand which was nearly 60,000,000 bunches a year.

Cherries.—Total cherry production in 12 states growing commercial crops was estimated at a record total of 215,360 tons in 1946—35% above the 148,190-ton crop of 1945 and 28% above the 10 year average. Sweet cherries amounted to 102,550 tons in 1946, about the same as in 1945, but 20% above average. Oregon had a large crop—60% above average—and Washington's crop was 23% above average. Both the California and Utah crops were large. The total 1946 sour cherry crop was estimated at 112,810 tons, double the 1945 crop. Michigan, the leading sour cherry state, harvested 64,300 tons compared with 14,500 tons in 1945, Wisconsin 16,700 tons compared with 7,300 tons and New York 18,200 tons compared with 9,900 tons in 1945.

Cranberries.—The 1946 crop of cranberries was the second largest on record—846,200 bbl. (100 lb. each) compared with 656,800 bbl. harvested in 1945. While cranberry production fluctuated widely from year to year, the general trend of production was upward. The Massachusetts crop which made up more than half of the national total was 550,000 bbl. in 1946 or about one-third more than average. New Jersey produced 77,000 bbl., not quite average, while Wisconsin harvested 128,000 bbl., a record for the state. Washington also produced a record crop of 46,200 bbl. Prices were higher than in 1945, wholesale prices at Chicago were \$7.50 per 25-lb. box in September compared with \$6.50 a year earlier. The average price to producers ranged from \$10 to \$15 per barrel from 1920 to 1940 and then rose to \$24 in 1944, \$21 in 1945 and about \$25 in 1946. The increase in production and prices had been stimulated by improved methods of canning and freezing. Only about half of the 1945 crop was sold as fresh fruit and in 1946 a larger part of the crop was expected to be processed. The increase in the consumption of turkey meat at all seasons of the year was also regarded as a factor in spreading the consumption of cranberries through the year.

Dates.—The California date crop was estimated at 10,500 tons in 1946 compared with 6,070 tons harvested in 1945 but 73% above the 10 year average. Very small quantities were produced in Arizona.

Figs.—The U.S. fig crop, grown in California and Texas, was large but not record-breaking. California dried fig production was put at 35,500 tons for 1946, well above the average. Of this total 27,250 tons were graded standard and 7,000 tons sub-standard. California fresh figs amounted to 18,000 tons and Texas 1,280 tons in 1946. Most of the latter were canned or preserved. A small quantity was sold for fresh consumption.

Grapefruit.—The total U.S. 1946 crop of grapefruit was estimated at 67,320,000 boxes which was above the record crop of 1945 at 63,550,000 boxes and an average of 40,083,000, 1935-44. Florida had more than half the national crop or 34,000,000 boxes, of which 16,500,000 boxes were seedless. Texas produced about double the previous 10-year average, 25,500,000 boxes and was gaining on Florida as a leading producer. The California and Arizona crops were of less importance but were increasing. California grapefruit brought lower prices in 1946 than a year earlier; Florida's were higher early in the year but later prices declined as the large crop began to arrive in market. Larger quantities were expected to be used for juice and canning during the winter season.

Table II.—U.S. Grapefruit Production by States, 1946 and 1945

State	1946†	1945	State	1946†	1945
Florida			Arizona . . .	4,300,000	4,100,000
Seedless . . .	16,500,000	14,000,000	California		
Other . . .	17,500,000	18,000,000	Desert . . .	1,390,000	1,220,000
Texas . . .	25,500,000	24,000,000	Other . . .	2,130,000	2,230,000

*Boxes hold 60 lb. in California; 80 lb. in Florida and other states.

†Preliminary estimate.

Grapes.—The 1946 crop of grapes was estimated at 2,851,150 tons, slightly more than the 2,791,650 ton crop of 1945 and 12% more than the average of 2,552,730 tons, 1935-44. Production in states other than California was 210,150 tons which was about 60% more than the light crop in these states in 1945 but still below the average. The California crop was 2,641,000 tons in 1946 which was about 13% more than the average which was usually more than 90% of the nation's total production. Wine varieties were estimated at 611,000 tons and raisins at 1,488,000 tons, while table varieties amounted to 542,000 tons. Frosts did some damage to late varieties. In the east New York and Michigan made the greatest increases over 1945.

Table III.—U.S. Grape Production in Leading States, 1946 and 1945

State	1946	1945	State	1946	1945
California . . .	2,641,000	2,663,000	Georgia . . .	2,200	2,300
New York . . .	63,200	31,300	Tennessee . . .	2,100	1,900
Michigan . . .	30,000	13,500	Maryland . . .	2,000	1,400
Washington . .	19,400	19,400	Kentucky . . .	2,000	1,100
Pennsylvania . .	18,700	6,000	Virginia . . .	1,400	250
Ohio . . .	15,400	6,400	West Virginia . .	1,300	200
Arkansas . . .	10,400	5,200	Alabama . . .	1,300	1,500
Missouri . . .	5,900	6,500	Arizona . . .	1,300	1,000
North Carolina .	5,900	3,700	Connecticut . . .	1,000	400
Kansas . . .	3,500	4,500	Delaware . . .	1,000	450
Oklahoma . . .	3,300	2,500	New Mexico . . .	900	1,100
Iowa . . .	2,700	3,000	Utah . . .	800	900
Illinois . . .	2,700	3,300	Wisconsin . . .	600	450
Texas . . .	2,500	2,100	Nebraska . . .	600	1,700
New Jersey . .	2,400	900	Florida . . .	600	600
Oregon . . .	2,300	2,300	Idaho . . .	500	450

Lemons.—The lemon crop of the United States, almost wholly grown in California, was estimated at 13,900,000 boxes in 1946 compared with 14,500,000 boxes raised in 1945 and an average of 12,550,000 boxes, 1935-44. The quantity of lemons grown in other states was so small as not to be reported. Prices of lemons were steady through 1945 and up to Aug. 1946 when an advance began that reached a top in October. Imports were expected to check further price advances.

Limes.—The lime crop of 1946—all of which was grown in Florida—was estimated at 170,000 boxes compared with 200,000 boxes harvested in 1945 and an average of 116,000 boxes, 1935-44. A limited but steady demand for limes continued in the large markets but there was no indication of an increase sufficient to encourage increased production.

Olives.—The U.S. olive crop, almost all grown in California, was estimated at 46,000 tons in 1946 compared with the small 1945 crop of 30,000 tons and an average of 43,500 tons, 1935-44. Imports of olive oil increased from less than 500 lb. in 1944 to more than 2,000,000 lb. in 1946.

Oranges.—The total 1946 U.S. orange crop was estimated at the high record of 120,230,000 boxes, 20% more than a year earlier and 53% more than the 1935-44 average. This increase was because of the larger Florida crop of 61,000,000 boxes compared with 49,800,000 boxes in 1945 and an average of 29,640,000 boxes, 1935-44. The California crop was slightly below the record of 60,500,000 boxes in 1944. Florida produced a larger crop of oranges than California in 1944 and 1945. Texas harvested 5,500,000 boxes in 1946 compared with 4,800,000 boxes in 1945 and an average of 2,539,000 boxes. Arizona had 1,270,000 boxes in 1946, double the 10-year average, 1935-44. The early varieties were estimated at 56,000,000 boxes, 20% more than 1945 and 54% more than average. The Valencia or late crop was put at 64,200,000 boxes. Orange prices were higher in the late summer than a year earlier but lower for the year as a whole.

Table IV.—U.S. Orange Production by States, 1946 and 1945

State	1946†	1945
California	52,100,000	44,180,000
Valencias	32,400,000	26,500,000
Navels and others	19,700,000	17,680,000
Florida	61,000,000	49,800,000
Early and midseason	32,000,000	25,400,000
Valencias	29,000,000	24,400,000
Tangerines	5,200,000	4,200,000
Texas	5,500,000	4,800,000
Arizona	1,270,000	1,210,000
Louisiana	360,000	330,000

*Boxes hold 77 lb. in California; 90 lb. in other states.

†Preliminary estimate.

Tangerines.—The 1946 crop of tangerines—all of which was grown in Florida—was estimated at 5,200,000 boxes compared with 4,200,000 boxes in 1945, 2,980,000 boxes average, 1935-44. About 516,000 boxes of the 1945 crop were processed and a larger part of the 1946 crop was so treated—a relatively new industry.

Peaches.—The peach harvest of 1946 made a new high record of 86,448,000 bu., 6% more than the 81,564,000-bu. crop of 1945, compared with the average of 59,938,000 bu., 1935-44. Record crops were harvested in all states in the west, Michigan, the north Atlantic region, while the ten southern peach states produced less than in 1945 and the north central states, except Michigan, reported less than the previous year's output. Michigan's record crop of 4,536,000 bu. was 74% above the average for that state. The Georgia crop was only 6,204,000 bu. compared with 8,091,000 bu. produced in 1945. The big California crop included clingstones, 22,210,000 bu. and freestones, 14,459,000 bu., the latter being a record harvest. The quality was especially good in 1946 and canning was operated at a high rate providing a large pack for 1947 consumption. A record pack was reported.

Table V.—U.S. Peach Production in Leading States, 1946 and 1945

State	1946	1945	State	1946	1945
California	37,335,000	30,836,000	New York	1,955,000	1,660,000
Georgia	6,204,000	8,091,000	Colorado	1,820,000	2,372,000
South Carolina	5,670,000	5,760,000	Pennsylvania	1,716,000	1,222,000
Michigan	4,536,000	4,400,000	Alabama	1,575,000	2,440,000
North Carolina	3,160,000	2,172,000	New Jersey	1,258,000	864,000
Arkansas	2,881,000	2,967,000	Illinois	1,210,000	1,748,000
Washington	2,700,000	2,465,000	Missouri	1,128,000	1,026,000
Virginia	2,407,000	536,000	Mississippi	1,116,000	1,418,000
Texas	2,262,000	2,774,000	Kentucky	936,000	1,273,000

Pears.—The 1946 pear crop set a new record at 35,488,000 bu. compared with 34,011,000 bu. harvested in 1945 and one-fifth larger than the average of 29,002,000 bu., 1935-44. The crop in the 3 states of the Pacific coast was 1% larger than the 1945 record and 35% larger than the average. The coast crop amounted to about 78% of the U.S. total. Production of Bartletts was slightly smaller than the year earlier but of other varieties was larger. A larger than usual proportion of the crop of Bartletts was canned in 1946. Prices of pears reached record high points early in the season but the average for the year to growers was about \$2.25 per bu. as received in 1945. A high record stock of pears was being held in cold storage on Oct. 1, a total of 7,445,000 bu.

WILD BANANAS being loaded on boats at an Indian village in the jungles of Panama in 1946, for the first stage of their journey to U.S. markets

Table VI.—U.S. Pear Production in Leading States, 1946 and 1945, and 10-yr. Average

State	1946	1945	Average 1935-44	State	1946	1945	Average 1935-44
California	11,167	12,292	8,805	Michigan	1,032	178	1,109
Bartlett	1,750	1,917	1,212	New York	656	272	1,029
Others	6,750	5,800	4,736	Texas	503	496	421
Washington	2,340	1,970	1,877	Georgia	454	502	359
Bartlett	2,292	1,794	1,617	North Carolina	390	360	324
Others	3,713	2,560	2,275	Mississippi	389	401	349
Oregon				Virginia	378	61	367
Bartlett				Alabama	343	416	282
Others				Pennsylvania	318	120	482

Plums and Prunes.—The commercial plum crop of the United States, which was grown almost entirely in two states, made a new record in 1946. California harvested 95,000 tons compared with 71,000 tons in 1945 and 69,200 tons average, 1935-44. The Michigan crop was 6,000 tons compared with 2,200 tons in 1945 and an average of 5,000 tons in 1935-44. Prices of plums were lower in 1946 than a year earlier.

Prune production, confined wholly to the four western states of Idaho, California, Washington and Oregon, amounted to a near record total. California reported 203,000 tons of dried prunes which was slightly less than the average. The total harvest of Oregon, Washington and Idaho was larger than in 1945.

Table VII.—Quantities of Prunes Used, Fresh, Canned and Dried in the U.S., 1946 and 1945

State	1946	1945
Used fresh		
Idaho	20,500	26,600
Oregon	19,500	23,600
Washington	11,500	13,450
Canned		
Oregon	44,000	19,000
Washington	9,500	7,550
Dried		
California	204,800	225,800
Oregon	8,700	7,700
Washington	400	250
Frozen		
Oregon	5,000	8,300
Washington	2,600	1,500
Other Processes		
Oregon	2,600	2,600
Washington	1,800	350
Idaho	600	600
Farm household use	7,000	6,500

About one-third of the crop of the three states was sold as fresh fruit and a larger amount was canned and frozen. Prices of dried prunes averaged higher in 1946 than the \$210 per ton average price of 1945.

Table VIII.—U.S. Production of Prunes by States, 1946 and 1945

(In tons, fresh basis)					
State	1946	1945	State	1946	1945
Oregon:			Washington		
Western	86,000	72,000	Western	11,200	7,700
Eastern	19,100	20,100	Eastern	18,300	18,200
			Idaho	21,900	28,000

Pineapples.—The Florida pineapple crop was estimated at 20,000 crates in 1946 compared with 10,000 crates in 1945 and 11,400 crates average, 1935-44. The imports of pineapples, fresh and canned, increased with the end of the war in the Pacific. In 1945 bulk imports increased to 11,350,000 lb. compared with 6,375,000 lb. in 1944 and prepared products to 24,292,000 lb. in 1945 compared with 18,851,000 lb. the year before.

Strawberries.—The 1946 production of strawberries was estimated at 6,933,000 crates of 24 qt. each compared with 5,201,000 crates harvested in 1945 and a 10-yr. average of 10,278,000 crates, 1935-44. The acreage was much below the prewar level, only 91,760 ac., compared with an average of 149,430 ac., 1935-44. The shortage of labour and higher wages were given as the causes of the reduction. Yields in 1946 were 75.6 crates per ac. compared with an average of 67.9 crates. Prices of strawberries averaged \$9.88 per crate in 1946 compared with \$8.60 in 1945 and \$3.50 for the 10-yr. average. Fewer strawberries were processed chiefly because of the sugar shortage. (See also AGRICULTURE.) (J. C. Ms.)

FTC: see FEDERAL TRADE COMMISSION.

Fuel Briquettes. The production of fuel briquettes in the United States expanded rapidly during the years of World War II, since it provided a satisfactory fuel from otherwise low-grade material. Output increased by 12% in 1945 and value by 18%, from 2,469,961 short tons in 1944 to 2,762,204 tons in 1945. In 1945 there were 32 plants operating in 15 states, with 7 more under construction. Wisconsin had 11 plants and more than half the output, using bituminous coal slack and anthracite fines that accumulated at the Great Lakes shipping ports. Capacity of the active plants in 1946 was 3,782,900 tons, with 700,000 tons more for plants under construction.

In addition to the briquettes reported above there was a growing output of "packaged fuel," which consists of a number of cubical briquettes wrapped and sealed in a package weighing about ten pounds, for convenience and cleanliness in handling. The production of package fuel declined from a high of 284,513 tons in 1940 to 175,770 tons in 1944, largely caused by shortage of labour and materials, but recovered to 208,143 tons in 1945. (G. A. Ro.)

Fuel Oil: see PETROLEUM.

Fuller's Earth. The production of fuller's earth in the United States increased from 294,737 short tons in 1944 to 296,368 tons in 1945, the highest figure after the record peak of 335,644 tons in 1930, and more than double the output of 1940. The refining of mineral oils took 61% of the total; vegetable oils 9% and absorbent uses 19%. (G. A. Ro.)

Funk, Walther (1890—), German politician and economist, was born on Aug. 18 in Trakehnen, East Prussia. He attended universities at Berlin and Leipzig, and joined the army at the outbreak of World War I but was discharged in 1916 as unfit for service. He started in newspaper work in 1912 and became editor of the leading German financial and economic daily, the *Berliner Boersen Zeitung*, in 1922.

Shortly thereafter he joined the nazis and in 1931 was called to Hitler's personal staff as economic adviser; in this post he acted as middleman between Hitler and the German industrialists.

Funk was appointed economics minister in 1938 but operated under the supervision of Hermann Goering, who was plenipotentiary general of the four-year plan; on Jan. 20, 1939, Funk replaced Dr. Hjalmar Schacht as president of the Reichsbank. Funk participated in the economic planning for the attack on the soviet union and was active in the nazi program of discrimination against Jews. Taken prisoner by U.S. troops in May 1945, he was indicted by the international military tribunal at Nuernberg, Aug. 29, 1945.

In his defense he described himself as a little man "who was frequently allowed up to the door but not in." Goering himself told the court that Funk was an "insignificant" subordinate. The court, nevertheless, found him guilty of crimes against the peace, war crimes and crimes against humanity, and on Oct. 1 he was sentenced to life imprisonment.

Furniture Industry. During 1946, the number of factories in the United States manufacturing household furniture increased from 2,500 to 6,100, the greatest growth in the history of the industry from the founding of the republic.

Of these establishments, approximately 4,000 manufactured wooden household furniture and 2,100 produced upholstered furniture. In 1945 there were 853 upholstering plants, indicating that the growth in this division had been the greatest of all.

Furniture production in the U.S. during 1946 increased approximately 40%, from \$640,000,000 to an estimated \$900,000,000. Much of this increase could be credited to new plants which began producing for the first time after V-J day. Of this production, approximately one-third was upholstered furniture, one-third casegoods and one-third novelty and miscellaneous furniture. At the close of 1946, casegoods still were scarce, while upholstered and novelty furniture was becoming more plentiful.

Unfilled orders on manufacturers' books were 31% above those at the beginning of 1946, pay rolls had increased 41%, the number of employees 24% and shipments 40% on a dollar basis. In units, however, furniture shipments were estimated to be about equal with those of 1943 when lower prices and production for war held dollar volume down to \$600,000,000. Manufacturers discontinued their lowest-priced lines in 1944 and concentrated on their best patterns. In 1946 low-priced furniture was just returning to stores after an absence of several years.

The year 1947 was expected to find the furniture industry becoming competitive again and, with nearly twice as many factories seeking to serve the 20,000 furniture and department stores of the country, competition was expected to be the strongest in the industry's long history. By midyear, it was predicted, a "buyer's market" would exist again and all but the casegoods branch would have caught up with their backlog of orders and the pent-up consumer demand for their goods. Because of the greater skill required in manufacturing casegoods, it was thought probable that this branch would not meet public demand for its output until the end of 1947.

The Jan. 1947 furniture markets at Grand Rapids, Chicago and New York city witnessed the introduction of the first post-war designs to appear beyond the drawing board stage. These were mostly modern designs embodying new decorative effects, such as leather, glass, plastic, mirror plate and copper tops, panels, insets or hardware. These new patterns proved that the modern trend was definitely toward the decorative and away from the simplicity of prewar years.

In traditional furniture, 18th century English designs retained prominence with French Provincial and Regency ranking in the order named. Early American furniture, discontinued because of a shortage of maple lumber during World War II, reappeared at the January markets and plastic, glass and metal furniture also was shown in greater quantities than at any other market. Plastic and glass furniture was most popular in the novelty field where many tables of these materials were being offered. Metal furniture was confined largely to the kitchen, breakfast room, lawn, porch and garden.

Furniture prices were expected to advance between 10% and 20% during 1947. Caused by competition already apparent in the industry, no price rises accompanied decontrol of the industry in late 1946. Before decontrol, OPA had under advisement a further increase for furniture manufacturers, as the one granted during 1946 benefited only those making low-priced furniture—to encourage its reappearance on the market.

There were few strikes in furniture factories during 1946 although more than half of the industry was unionized, chiefly with C.I.O. jurisdiction. Those strikes that did occur were mostly of short duration and only one large plant, the largest upholsterer in the industry, employing 2,500, was mainly out of production for more than 100 days.

Manufacturers were gratifyingly surprised that when the industry was decontrolled in late 1946 there was no cancellation of back orders such as followed World War I when, in 1921, most furniture factories found their backlogs wiped out with their warehouses filled with goods ready for shipment. These goods were dumped on the market at discounts that kept the industry "in the red" for several years. Back orders were in 1946 at an all-time peak of \$500,000,000—an average of more than 180 days' production for every factory in the U.S. Whether the introduction of new designs would create cancellation of orders for older patterns was the number one problem faced by manufacturers at the beginning of 1947. Otherwise their worries were few, with lumber becoming more plentiful and more men applying for jobs every month. With furniture factory profits the highest in modern times, with demand still strong and with more new homes being built requiring still more furniture, the industry anticipated a busy and profitable year during 1947. (See also INTERIOR DECORATION.) (J. A. G.)

Furs. The fur industry in the United States encountered its first financial setback in three years during the last quarter of 1946. Failures in the trade increased over 1945. They totalled 46 from Dec. 1945 to Nov. 1946, with \$1,951,639 involved. The rapid decline in fur skin values during the last quarter of 1946 and collapse of fur apparel prices in November and December were favourable to the consuming public. For the first time from 1943, it was a consumer's market.

The U.S. fur trade was active during the first half of 1946. Prices of both foreign and domestic furs remained inflated except on long-haired pelts. Consumer demand was strong until September when a definite decline became evident. Weather and the soft coal strike upset consumer buying plans. Reduced fur apparel prices stimulated consumer buying. Huge quantities of fur coats were sold. However, luxury articles marked down 50% and more were difficult to sell in December. It is estimated that the industry transacted as large a dollar and cents business as in 1945 but unit sales were reported lower.

It was a satisfactory year for mink breeders, fairly satisfactory for mutation fox breeders though disappointing for silver fox breeders. During the first half of the year mink farmers sold the greater part of their pelts at slightly lower prices than in 1945. Wild mink was a fashion favourite and often brought higher prices than ranch mink. Most of the crop of all kinds of mink was sold by fur farmers before prices broke in the market. Prices reached a top of \$65-\$75. Mutation minks increased in number and prices were generally satisfactory. Top prices were \$190 and \$172 per skin. Manufacturers and retailers of mutation minks encountered consumer price resistance during the second half of the year. New mink skins offered in Dec. 1946 met strong price resistance.

Colour-phase foxes sold well. Prices were easier than in 1945. Platinum type fox was a favourite. Finest specimens sold around \$200 for the raw skin. Silver fox was in weak demand and prices declined. Finest skins found buyers but few pelts sold up to \$100.

U.S. imports and exports of raw furs increased greatly. Considerable shipments of furs were received from China, much of them old merchandise. Prices on oriental furs met strong resistance. Large quantities of skins were received from the soviet union. They sold freely at prevailing market prices. The United

RED FOX SKINS which were included in the first postwar fur sale in London, held in 1946

States continued to purchase quantities of Indian furs. Large quantities of nutria were shipped from Argentina and Uruguay, also ocelot, spotted cat and shearling lambskins. The lambskins were made into mouton in the United States and became one of the favourite items of the year. Limited quantities of wild fur skins from Brazil and other South American countries were imported.

Persian lamb imports totalled approximately 5,000,000 skins from Afghanistan, South-West Africa and the U.S.S.R. Smaller quantities of other fur skins were brought in from the Scandinavian and other European countries. There were also limited imports from Australia and New Zealand. Canada was one of the chief sources of supply for skins for the U.S.

The London market became active in 1946 with the return of the Hudson's Bay Company Fur Auction sales to that city. The British government confined activities of London firms to processing and marketing of fur skins and fur apparel for export only. Domestic consumption of furs was discouraged and limited to a few types of inexpensive peltries. The policy was to make the fur industry produce revenue through export sales. The revival of the London fur auctions met with some success but Europe was not ready to purchase furs extensively.

Paris struggled bravely to re-establish its fur business; but government regulations and lack of manpower and purchasing power prevented any real revival. The *couturiers* attempted to re-establish Paris fashions.

The favourite furs in the U.S. trade during 1946 were, in their approximate order, muskrat, Persian lamb, mouton, mink, beaver, nutria and Indian lamb, followed by the cheaper types of short-haired furs. Long-haired furs were neglected. Colour-phase foxes sold well; silver fox declined in popular demand. Rabbit consumption declined, being adversely affected by the strongly promoted mouton or processed lamb.

According to the American Fur Merchants association skin sales by members during the period Dec. 1945 through Nov. 1946 totalled \$66,643,148 compared with \$64,445,684 for the corresponding period in 1945. These figures represent a major part of skin sales in the industry.

During the first 10 months of 1946 raw fur imports approximated \$200,000,000 and fur exports \$40,000,000.

During the year all government regulation on furs and fur skins by OPA was removed. The tax collected by the government on taxable fur apparel and fur-trimmed articles totalled \$68,537,094 for the first 10 months. This total, which represented 20% on the retail selling price of merchandise, compared with \$62,080,746 collected during the corresponding period in 1945. At the end of the year Pres. Harry S. Truman announced a reduction in many emergency war taxes, including the fur tax. This was to be reduced to 10% of the retail selling price effective July 1947. (W. J. B.)

FWA: see FEDERAL WORKS AGENCY.

Galen, Clement August von, CARDINAL (1878-1946), archbishop of Muenster and one of the most vigorous and plain-spoken foes of nazism within Germany, died on March 22, 1946, barely a month after his elevation to the Sacred college by Pope Pius XII. Born at Dinklage in his ancestral Westphalia, of a family on his own rating "neither particularly handsome nor clever, but incorrigibly Catholic," he was educated in Germany and at the Pontifical Gregorian university at Rome, being ordained priest in 1904. A fruitful pastoral and social apostolate spanned World War I and the unstable years of the Weimar republic, preparing him for the arduous episcopal charge of Muenster (Catholic population: 1,750,000) to which he was summoned in 1933, the year Hitler rose to power.

Physically of giant stature, blessed with a robust sense of humour and a devastating gift of irony, Von Galen was fearless from the outset in his defiance of nazi ideology and terrorism. In 1934 he extracted a personal guarantee from Hitler that the progressive neopaganization of German youth projected by the regime would not be pressed. As nazi bad faith became more apparent, the Concordat with the Vatican was repeatedly violated. The bishop thereupon began a campaign of thunderous protest and dire predictions of calamity for Germany from his cathedral pulpit, in the press and by curt personal telegrams to the Fuehrer and various reichsministers. This earned him at home and abroad the soubriquet of "Lion of Muenster."

Throughout World War II, during which Muenster was a frequent target of Allied bombing raids, Von Galen's sermons and pastoral letters were often sensational and uncompromising indictments of the theory and practice of totalitarianism. When the reich collapsed in 1945, he met the victorious Allies with the proud and courageous avowal of a Christian prelate who had never allowed the claims of justice, patriotism and world citizenship to come into conflict:

We accept the consequences of the war, grieve over our dead, our destroyed cities. We will bear it patiently with the help of God. But we will not accept unjust accusations and punishment for the injustices and cruelties under which we ourselves had to suffer heavily for many long years. (J. LAF.)

Gambia: see BRITISH WEST AFRICA.

Gandhi, Mohandas Karamchand (1869-). Hindu nationalist leader, was born at Porbandar (Kathiawar), India. For his biography, see *Encyclopædia Britannica*. On Jan. 22, 1937, Gandhi announced his retirement from active Indian politics, but by 1940 he was as prominent as ever in Indian affairs of state. In April 1941 he announced that the Congress party had temporarily abandoned its aim of independence for India, but he reaffirmed his personal policy of nonviolence.

On March 27, 1942, Gandhi conferred with Sir Stafford Cripps; later he rejected the latter's proposals for Indian post-war independence. On Aug. 9, after the All-India Congress party had approved his proposals for a civil disobedience campaign, Gandhi was arrested with 200 other Indian leaders and was held as a political prisoner in the Aga Khan's palace in Poona. He was released in May 1944 because of failing health. Gandhi warned (Feb. 18, 1945) that a new and bloodier war would come about unless India and governments in similar positions were given their independence. While he approved the Simla parley (June 19, 1945) as a "great advance," he did not attend.

The British independence plan issued in a White Paper, May 16, 1946, led Gandhi to declare that "whether you like the plan or not, it is going to be the momentous one in the history of

India." Subsequently he called it the "best document the British government could have produced in the circumstances." However, he voted against it at the session of the Congress party, July 7; the party approved the plan by a 204 to 51 vote.

The Moslem-Hindu rioting throughout the year angered Gandhi who warned (Nov. 5) that he would "fast unto death" if the fighting continued, and on Jan. 2, 1947, he began a walking tour of East Bengal villages to improve Hindu-Moslem relations.

Gardner, Oliver Max (1882-1947), U.S. politician, government official and diplomat, was born March 22, 1882, in Shelby, N.C. He served with an Illinois regiment during the Spanish-American War (1898). He was graduated in 1903 from the North Carolina State College of Agriculture and Engineering, Raleigh, N.C., studied law at the University of North Carolina, Chapel Hill, N.C., 1905-07, and practised in his home town. He went into Democratic state politics and was a member of the state senate, 1911-15.

Gardner was governor of North Carolina for the 1929-33 term and held government posts during World War II, becoming chairman of the advisory board of the Office of War Mobilization and Reconversion in 1944. On Feb. 19, 1946, President Truman appointed him undersecretary of the treasury; Gardner resigned as chairman of the OWMR advisory board July 4, 1946. He was named ambassador to Great Britain on Dec. 9, 1946, but he died in New York city on Feb. 6, 1947, before he assumed his new post.

Garnet: see ABRASIVES.

Gas, Natural. The marketed production of natural gas in the United States increased from 3,414,689,000 cu.ft. in 1943 to 3,711,039,000 cu.ft. in 1944; the corresponding figures for domestic consumption were 3,403,479,000 and 3,696,463,000 cu.ft. The small differences between production and consumption represent exports, mainly to Mexico. The types of consumption included 220,747,000 cu.ft. for commercial users, 562,183,000 cu.ft. for domestic and 1,757,327,000 cu.ft. for industrial uses, but consumption by petroleum refineries, carbon black plants and public utility power plants ran well ahead of the industrial average, while Portland cement showed a decrease. The proportion of the output treated for the recovery of natural gasoline declined from 99% in 1940 to 89% in 1943 and 88% in 1944. Preliminary estimates for 1945 give 3,845,000,000 cu.ft. for marketed production and 3,825,000,000 cu.ft. for consumption, including 240,000,000 cu.ft. for commercial users, 610,000,000 cu.ft. for domestic, and 2,975,000,000 cu.ft. for all industrial users. Canadian production of natural gas increased from 45,067,158 cu.ft. in 1944 to 52,973,699 cu.ft. in 1945, but declined to 36,811,632 cu.ft. in the first three quarters of 1946, 3% less than in the same period of 1945. (See also FEDERAL POWER COMMISSION.) (G. A. Ro.)

Gasoline: see PETROLEUM.

Gasparri, Enrico, CARDINAL (1871-1946), Italian prelate, was born on July 25 in Ussita, and was ordained in 1894. A nephew of Pietro Cardinal Gasparri, noted secretary of state at the Vatican under Popes Benedict XV and Pius XI, he served as private secretary to his uncle when the latter was nuncio to Peru. The younger Gasparri was later attached to the apostolic delegations to Bolivia, Ecuador, Portugal, Belgium and Switzerland. In 1915, he became apostolic delegate to Colombia and was transferred from there to Brazil

where he served until 1925. While in the latter post, he was created a cardinal (Dec. 1925) and was assigned to the titular church of San Bartolomeo al' Isola. He became prefect of the supreme tribunal of the apostolic signature, 1933, and in the same year took over the diocese of Velletri. He was a member of the sacred congregations of the Eastern Church, sacraments, the council, propaganda fide and of extraordinary ecclesiastical affairs. At the time of his death in Rome, on May 20, he was second senior member of the Sacred College of Cardinals.

Gaulle, Charles de (1890—), French army officer and statesman, was born Nov. 22 in Lille, France. He was graduated from St. Cyr military college at Paris shortly before the German invasion of France in 1914. Wounded three times during World War I, he was captured by German troops at Verdun in 1916, but escaped and saw further action on the western front and in the near east.

After the end of World War I, De Gaulle's pleas that France mechanize its armies were ignored by the conservative French general staff which continued to place its trust in static defense. When German mechanized forces skirted the Maginot line and overran all France in the summer of 1940, De Gaulle fled to London, formed a French exile regime (June 23, 1940) and rallied many French colonies to the Allies. In Sept. 1941, he formed a Free French (later the Fighting French) national council. As supreme commander of French armed forces, he returned to Paris after its liberation in Aug. 1944 to become head of a provisional French government. Following the defeat of the reich in May 1945, De Gaulle insisted that France be given proper recognition as a great power and advocated internationalization of the Ruhr and the Rhineland. On Nov. 6, 1945, the constituent assembly unanimously elected De Gaulle interim president of the new provisional government. He resigned Jan. 20, 1946, declaring that he was retiring from political life. However, in an important statement of policy at Bayeux (June 16), he called for a bicameral parliament and establishment of a strong state. He also advocated (July 28) establishment of an Anglo-French entente to balance the preponderant power of the U.S. and the soviet union in world affairs.

An adamant opponent of the new constitution, De Gaulle had frequently appealed to the French voters to reject it, on grounds that it would lead to a dictatorship. One of his major objections was the limitations imposed by the new charter on the authority of the president. However, the majority of the French electorate endorsed the new constitution and on Dec. 28, De Gaulle announced he would not be a candidate for the presidency, stating that he did not wish "to preside, powerless, over the powerlessness of the state."

Gems and Precious Stones. Except for diamonds, which are covered in a separate section, the effect of World War II was disastrous in most of the leading gem producing areas. Aside from diamonds, sapphire was the only precious stone having industrial applications that led to increased demand. While the use of sapphire pivot bearings or "jewels," in watches and scientific and technical instruments was greatly expanded by war uses, much of the demand was satisfied by synthetic sapphire, rather than by the natural stone. In the U.S., sapphire production dropped from 20,000 oz. in 1943 to 4,500 oz. in 1944, and was discontinued in 1945. Information was lacking on operations in Australia and India after the beginning of the war.

The gem producing areas of Burma, Siam and Indo-China were presumably operated only to a minor degree if at all while in enemy hands. Little or nothing was done in Ceylon and Madagascar, as the graphite mines had priority on the labour

supply. The Colombian emerald mines were dormant even before the war; the 1945 U.S. imports included 1,085 carats of rough and 106,684 carats of cut emeralds, but nothing was known about their source except that some were soviet; also there was no indication as to whether the product was new production or old, but the valuation was extremely low, indicating poor quality. Early in 1946 it was reported that the remaining emerald stocks held by the Colombian government were sold to a U.S. jewellery firm, and there was a possibility that the mines would be reopened.

Under the conditions that had prevailed for several years, supplies of gem stones other than diamonds had been greatly restricted, and markets had reacted accordingly. (See also MINERALOGY.) (G. A. Ro.)

General Federation of Women's Clubs: see SOCIETIES AND ASSOCIATIONS.

Genetics. In 1946 significant advances were made on the nature of natural and induced mutations, on population genetics and hybridization and their bearing on evolution.

Natural and Induced Mutations.—In tests for spontaneous lethal mutations in about 200,000 X-chromosomes of *Drosophila melanogaster* H. J. Muller demonstrated a mutation rate two or three times as high in the first sperm produced by young males as in sperm produced a week later. K. Mampell reported experiments which seemed to indicate the transfer of a mutator substance from one species of *Drosophila* to another and its persistence in the germ plasm of the second species. J. R. Preer showed that a cytoplasmic factor which conditions the "killer" phenotype in one variety of *Paramecium aurelia* has a reproduction rate independent of the fission rate of the animals. L. J. Stadler found that mutations at the R locus in corn produced either colour change in the plant or in the seed with about equal frequency. Mutations with both effects occurred very infrequently. The plant colour allele mutated much more frequently to the seed colour allele than did the original wild-type allele. He concluded that the several mutations were not independent alterations of distinct components of a gene-complex. F. J. Ryan and J. Lederberg proved that the variant in the mould, *Neurospora*, incapable of synthesizing leucine, was a true gene mutation by securing reverse mutations at this locus. By means of ultraviolet and X-rays M. Demerec induced mutations from sensitivity to resistance to bacteriophage in a strain of the bacterium, *Escherichia coli*. Most of these mutations showed a delayed effect, occurring in the strain at a considerable interval after treatment. B. Kaufmann and collaborators showed that treatment of *Drosophila* sperm with infra-red rays either prior to or following X-radiation increased the number of chromosomal rearrangements over X-ray controls, while treatment with ultraviolet following X-rays decreased the number of rearrangements. D. G. Catcheside, D. E. Lea and J. M. Thoday irradiated *Tradescantia* microspores and analyzed factors involved in the formation of interchanges of chromatids. They found that two breaks must be within a micron of each other to allow interchange. Increasing the temperature decreased the number of interchanges.

Population Genetics, Hybridization and Evolution.—S. W. Mead, P. W. Gregory and W. M. Regan reported the discovery of eight deleterious recessives in cattle through inbreeding studies on six bulls. The culmination of this important experiment indicated that domestic cattle carried a heavy load of defective genes which might be eliminated by improved breeding

programs. T. Dobzhansky demonstrated that the gene complexes carried in three wild second chromosomes of *Drosophila pseudoobscura* gave many different viability potentials through recombinations because of crossovers. It was concluded that natural populations of flies contained tremendous reservoirs of potential adaptive variability. N. P. Dubinin and G. G. Tiniakov studied *Drosophila funebris* populations and found a much higher frequency of flies heterozygous for chromosome inversions in urban than in rural populations. They also demonstrated seasonal cycles in inversion frequencies. C. C. Tan demonstrated a complex series of multiple alleles for colour in wild strains of the ladybird beetle, *Harmonia axyridis*. J. A. Moore showed that northern strains of the frog, *Rana pipiens*, when crossed to southern strains, produced abnormal hybrids. In contrast, the northern species, *Rana palustris*, produced normal hybrids with both northern and southern *R. pipiens*. H. N. Hansen and W. C. Snyder demonstrated in the fungus, *Hypomyces solani*, that the genes determining maleness and femaleness were carried on homologous chromosomes, but at loci some distance apart. Crossing-over resulted in the production of hermaphrodites and neuters. M. Gordon reported alternative sex-determining mechanisms in the platyfish. In wild varieties the male was the heterogametic sex while in domestic forms the female was heterogametic. J. T. Patterson found that in many species of *Drosophila* an insemination reaction characterized by swelling of the vagina followed copulation. In interspecific crosses the reaction was extreme and formed an effective isolating barrier, preventing hybridization. E. S. McFadden and E. R. Sears presented evidence that the hexaploid wheat, *Triticum spelta*, was an allopolyploid, which had arisen after natural hybridization of diploid and tetraploid species. They were able to produce a synthetic hexaploid similar to *T. spelta* by appropriate crosses followed by chromosome doubling induced by colchicine. J. B. Hutchinson reported on a series of five alleles at the "crinkled" locus in new world cottons. Two of these alleles were wild-type as homozygotes and distinguishable only in heterozygous combinations with the others. S. G. Stephens showed that in crosses between two species of cotton in the West Indies an inferior hybrid type known as "corky" was a heterozygote for two alleles at one locus. Strains carrying one of these "corky" alleles were found in each species in regions where the two species were grown together.

Geographical Society, American: see SOCIETIES AND ASSOCIATIONS.

Geography. The year 1946 was a year of strenuous activity in the field of geography. The effort to win a world-wide war had, among other things, brought home to the vast majority of people a conception of how small the world had in fact become, of the interdependence of widely separated areas. The millions who carried arms in the war, in the majority of cases, saw new lands, new climates, new and strangely different ways of life. The very fact of fighting the same war in Port Darwin and in Murmansk, in Madagascar and in Kiska was in itself a clinching argument of the interrelationship of widely separated regions and peoples. The wide popular interest generated by these experiences was maintained by the geographically remote yet vitally important peace negotiations of the first year of peace. The result of this continuing interest in other lands and other peoples was the continuance of the pressure on geographers to provide information to the public and to continue to serve in government.

The experiences of the war and of the "preliminary" year of peace were evident in three principal ways:

- (1) An increasing number of persons were engaged in various professional and technical phases of geography.
- (2) An ever-increasing number of colleges and universities were offering general interest courses in the geography of various regions of the world, as well as in more technical aspects such as map making and climatology. Moreover, a large number of government agencies were continuing and in some cases adding to this program in various phases of geographic inquiry.
- (3) The character of the materials with which geographers were dealing in 1946 reflected the lessons taught during the war.

Increased Personnel.—Figures compiled by the National Research council, working with the U.S. government, indicated that the number of professional geographers in the United States had risen markedly. This was particularly true in 1946 if those persons who were trained in specialized phases such as cartography and aerial photo interpretation were to be included with those given a more general training.

This fact reflects the effectiveness of programs of intensive training established both in the universities and in various government agencies, including the armed forces. Short courses in navigation, map reading, field surveying, climatology and cartography all did their part in preparing hundreds of selected persons for specialized war tasks. In a number of the agencies of the government, trained personnel was so scarce in the early phases of the war that programs of training on-the-job were devised. One result of these "forced draft" courses was to provide a far greater number of persons than before with skills and experience in one or more parts of the discipline of geography. An additional sidelight on the effect of the war was the sharp increase in the number of students enrolled in 1946 in geographic courses. As an example, the department of geography at the Ohio State university, Columbus, O., reported 1,600 students enrolled in its various courses, an average of slightly more than 1 student in 10 on the campus, far exceeding the prewar student participation.

Geography in Higher Education.—It seemed probable that 1946 was a year without precedent in the history of geography in the United States as regards new developments in the universities and colleges. Many entirely new departments of geography were established. The Universities of Virginia, Illinois, Iowa; Rutgers university; George Washington university; Catholic University of America; Northwestern university, and many others, all added geographers to their staffs on a full-time continuing basis, apparently for the first time.

In addition, many other schools which had previously offered courses in geography expanded their programs and added new members to their staffs in addition to those who returned to their old posts after having been on leave for war work. Into still a third category came schools such as Syracuse university and Washington university of St. Louis which strove to lay more emphasis on geography in their curricula by placing it in a separate department, rather than combining it with the study of geology as in the past.

It was worthy of note that in nearly all the numerous institutions which featured the study of international relations following the war, geography played an important role, receiving careful consideration as one of the integral factors of the international scene.

Modified Emphasis in Geography.—It was already possible in 1946 to see the results of wartime experience expressing themselves in a shift in emphasis in the application of geography in the universities and elsewhere. To take one example, it appeared that a great deal more emphasis was being laid on maps. A number of leading schools announced increased work in cartography and the use of maps, reflecting a lesson driven home many times over during the war, namely, that the map is one of the most valuable tools of the geographer both in investigation and exposition.

Another change which became evident in 1946 was an increas-

CARTOGRAPHERS of the National Geographic Society going over every square inch of a map proof with a magnifying glass

ing tendency to study the various regions of the earth not for the sake of the knowledge itself, but rather with the aim of understanding economic or political trends of the day. Increased sensitivity to affairs abroad and a greater realization of their significance at home lent a stimulus to this new and revealing point of view.

The same features which characterized geography in the universities were visible as well in government, and for the same reasons. It had become clear by 1946 that a prerequisite to an informed foreign policy was adequate information of all types from abroad. This realization had resulted in the retention of numerous geographers in government offices who were furnished with funds and equipment adequate to the task. (See also NATIONAL GEOGRAPHIC SOCIETY; SOCIETIES AND ASSOCIATIONS.) (R. S. McC.)

Geology. During 1946 national conventions, sectional meetings and field conferences of geological societies were resumed on a normal scale. Expansion of research in the United States was stimulated by the far-flung program sponsored by the army and navy, and investigations of the geology and mineral resources of conquered countries were conducted by these organizations.

New developments in mapping technique based upon aerial photographs and other methods were exploited by the U.S. geological survey.

The development of atomic power and the realization of the necessity of scientists to adjust themselves to the ways of politicians brought about a change in viewpoint. An excellent treatise, *Science in a Changing World* by E. J. Cable, R. W. Getchell and W. H. Kadesch, was published in New York.

There was a marked increase in the number of foreign publications on geology released as a result of the cessation of hostilities. Many of these dated back a number of years.

The wartime shortage of geologists was somewhat alleviated by the return of geologists to peacetime pursuits and by the graduation of veterans whose training was interrupted by war

service. Educational institutions were handicapped by the lack of adequately experienced teaching personnel because of the substantial deflection of former teachers into applied geology. Much attention was devoted to the training of geologists by the Geological Society of America, which published reports on conferences on the subject. A vocational booklet on *Geology as a Profession* was published by the staffs of the National Roster of Scientific and Specialized Personnel and United States office of education.

On the morning of Dec. 21, catastrophe visited Japan where an earthquake offshore set up a series of destructive tidal waves which swept Honshu, Shikoku and Kyushu Islands.

General Geology.—A popular treatise by a well-known author is C. A. Cotton's *Earth Beneath*, Wellington, New Zealand, 1945.

Geomorphology.—The increased attention to the continental shelves in connection with war research and exploration for oil and gas revealed valuable additional information on submarine canyons. Much new data were also assembled on the topography of the deep ocean floors.

Glacial Geology.—A "Glacial Map of North America" was published by the Geological Society of America. In *Science* for July 19, G. N. Lewis published an intriguing article on "Thermodynamics of an Ice Age: The Cause and Sequence of Glaciation."

Sedimentation.—Geological and geophysical studies of Bikini Atoll in connection with the bomb tests of 1946 revealed valuable information regarding the origin of coral reefs and allied problems. A new type of gravity bottom sampler was described by M. J. Hvorslev and H. C. Stetson in the October *Bulletin* of the Geological Society of America. Two outstanding books were F. S. Zeuner's *Dating the Past, An Introduction to Geochronology* (London) and C. E. ZoBell's *Marine Microbiology. A Monograph on Hydrobacteriology* (Waltham, Mass.).

Stratigraphy.—A monograph by Max Welten on *Pollen-analytische, Stratigraphische, und Geochronologische Untersuchungen aus dem Faulenseemoos bei Spiez* (Zurich, 1944) became available in the United States.

Historical Geology.—F. E. Zeuner's *The Pleistocene Period, Its Climate, Chronology and Faunal Successions* appeared in London during 1945.

Structural Geology.—R. A. Daly in the August *Bulletin* of the Geological Society of America revised his assumptions regarding the constitution and behaviour of the outer half of the earth's silicate mantle. A method of determining the compressibility of a crystalline rock from its chemical composition was developed.

J. H. F. Umbgrove discussed the "Origin of Continental Shelves" in the February *Bulletin* of the American Association of Petroleum Geologists and discoursed "On the Origin of Continents and Ocean Floors" in the May *Journal of Geology*. "A Comparative Study of Tectonics of North America and the European Platform" was covered by N. S. Schatsky in a *Bulletin* of the Academy of Sciences, U.R.S.S.

Vulcanology.—A symposium on *El Parícutin, Estado de Michoacan* was issued in 1945 by the National University of Mexico under the editorship of Teodoro Flores.

Petrography.—Important contributions to this field were "Petrographic Research in the Academy of Sciences of the USSR" by P. I. Lebedev, of the 1945 geological series of the Academy, and "Thermal Diffusion-Convection as a Cause of Magmatic Differentiation" by Walter Wahl in the June *American Journal of Science*.

Regional Geology.—A new geological wall map of North America was completed and published by the Geological Society of America.

Applied Geology.—Part 2 of the August *Bulletin* of the American Association of Petroleum Geologists contains a valuable "Directory of Geological Material in North America," edited by J. V. Howell and A. I. Levorsen. A field and reference book on *Principles of Field and Mining Geology* was published in New York by J. D. Forrester.

Problems arising from the rapid depletion of certain mineral resources were considered in a symposium entitled "Our 'Vanishing' Natural Resources," published by the United States chamber of commerce. A. M. Bateman considered "New International Mineral Problems" in *Economic Geology* for Dec. 1945.

The fourth of the series of annual reviews of petroleum geology under the editorship of F. M. Van Tuyl and W. S. Levings was issued by the Colorado School of Mines.

As a result of the large number of new projects being initiated by the United States reclamation bureau, the geological staff of that organization was substantially expanded. As pointed out by D. J. Belcher in the August *Bulletin* of the Geological Society of America, the use of airphotos to facilitate engineering planning and construction was increased. (See also MINERALOGY; PALAEONTOLOGY; SEISMOLOGY.) (B. H. P.; F. M. V. T.)

George II (1890—), king of the Hellenes and eldest son of former King Constantine, was born on July 20 at Tatoi, the royal villa near Athens. For his early career see *Encyclopædia Britannica*. The king had been twice exiled—the first time by internal opposition to his rule in 1923 and the second time by the German invasion in April 1941. After his flight from Athens and later Crete during World War II, he took up residence in London in Sept. 1941. Upon the close of the war the Greek royalist factions, supported by the British, advocated his return to the throne, but Republican and extreme leftist groups were strongly antagonistic to restoration of the monarchy. The restoration issue was one of the contributing factors in the Greek civil war that started in Dec. 1944. As Winston Churchill had suggested on Nov. 11, 1943, the question of his return was left up to the people and on Sept. 1, 1946, in a plebiscite on the issue, about 70% of the electorate voted for a return of the monarchy. Antiroyalist factions maintained that only a small portion of the population voted in the plebiscite and that, therefore, the vote did not constitute a true test of national sentiment. The king returned to his homeland Sept. 27, 1946. His reassumption of the throne, however, was marked by increased internal violence and the refusal of Republican leaders to join in any cabinet whose program was laid down by the proroyalists.

George VI. Accompanied by the queen and royal guests from abroad, and surrounded by high officers of state, dominion statesmen and ambassadors of the Allied powers, King George VI took the salute in the Mall at a great victory march-past on June 8, 1946. At night the king saw the illuminated capital from the royal barge, passing from Westminster to the city and back to the houses of parliament.

State visits were paid in June to Scotland where, staying at Holyrood, the king drove to Falkirk, Stirling and Linlithgow, and in July to North Wales for a drive through Snowdonia to Caernarvon. Other visits were made in May to Winchester for the traditional *ad portas* ceremony at Winchester school; in July to Canterbury for a thanksgiving service at the cathedral and an inspection of the King's school and of the remains of the Roman city, unearthed by postwar excavation; and in October to Oxford to open an extension to the Bodleian library. London events attended by the king included the 499th anniversary pageant of St. Bartholomew's hospital (May 9), the centenary of the Royal Veterinary college (May 23), a march-past of Boy

Scouts in April, a reception of the Imperial Press conference in September and the dedication of the Savoy chapel as the chapel of the Royal Victorian order in October. On Nov. 10 the king unveiled new dates on the Cenotaph in remembrance of the two world wars and laid the first wreath there.

When the United Nations delegates met in London in January for their first assembly the king gave a banquet for them at Buckingham palace. Dominion premiers in London in May were also entertained there. The first postwar garden party at the palace in May was followed by one for tenants and neighbours at Sandringham. In June the king opened the Empire Scientific conference in London and in October broke his holiday at Balmoral to inaugurate the "Britain Can Make It" exhibition in Kensington, London.

The king attended the Universities Rugby match, the Association Football Cup final, the centenary match of the Surrey County Cricket club (May 23) and the England v. All India cricket match at Lords (June 25). A Polytechnic marathon was started by the king in June. He was at Ascot, at the Derby and at Newmarket (where he won the One Thousand Guineas stakes). A new trophy, the King George VI cup, run for the first time at Ascot over a two-mile course in October, added a fourth to the three classic races for three-year-olds. With the queen and princesses the king attended three great society weddings, that of the Hon. Andrew Elphinstone to Mrs. Vicary Gibbs in May; of the duke of Northumberland to Lady Elizabeth Scott at Westminster abbey in June; and of Lord Brabourne to the Hon. Patricia Mountbatten, at Romsey abbey in October. On Nov. 2 he attended the first Royal Command film performance at the Empire theatre, London.

The king lent 500 historical paintings for a winter Academy exhibition opened in October at Burlington house. (See *Encyclopædia Britannica*.) (L. Du.)

Georgia. One of the original states of the union, located in the south Atlantic region, with an area of 58,876 sq.mi., Georgia is popularly called the "Empire State of the South." Population (excluding armed forces overseas) was 3,191,766 on July 1, 1945, an increase of 2.2% over the 1940 census of 3,123,723 (34.4% urban, 65.6% rural, 64.9% native white, 34.7% Negro and .4% foreign-born). Atlanta, the capital city, has a population of 302,288. The four next largest cities are Savannah (pop. 95,996), Augusta (65,919), Macon (57,865) and Columbus (53,280).

History.—The general assembly met in regular session from Jan. 14 to Jan. 28, 1946. Chief interest centred in a proposal to amend the constitution to remove the ban against the governor's succeeding himself until the expiration of four years. This amendment had been defeated in a special session of the general assembly in the summer of 1945, and the assembly again rejected the proposal.

Candidates for governor in the Democratic primary on July 17, 1946, were Eugene Talmadge (governor, 1933-37; 1941-43), Eurith Dickinson Rivers (governor, 1937-41), James Vinson Carmichael and Hoke O'Kelley. Talmadge campaigned upon a platform of white supremacy. Gov. Ellis Arnall and most of the newspapers supported Carmichael, a Cobb county lawyer who advocated "making the Negro a citizen." Under the constitution of Georgia any person 18 years of age who is either of good character or able to read and write, and has resided in the state one year is qualified to vote in state elections. No candidate in the gubernatorial race sponsored a literacy test; hence, on the race issue the choice was between suddenly enfranchising all of the Negroes or continuing to disfranchise all of them by the substitution of party rules for state laws. The vote of the people, the largest ever cast in Georgia, gave a county unit vote (dec-

sive in Georgia) as follows: Talmadge, 242; Carmichael, 148; Rivers, 20. The popular vote for Carmichael was 314,421; for Talmadge, 305,777, and for Rivers, 69,750. The number of Negroes who voted *en bloc* for Carmichael was estimated at 100,000.

A tragic sequel to the agitation of the racial issue in the gubernatorial campaign was the murder on July 25 of four Negroes in Walton county by a band of white men. In contrast to this racial agitation in the political realm, racial harmony was evidenced by a joint meeting of 1,000 Negro delegates to the General Missionary Baptist Convention of Georgia (representing a church membership of 710,000) and 500 white delegates to the Georgia Baptist convention (representing a church membership of 590,000) held in the City auditorium in Savannah on Nov. 12. This was the first joint meeting ever held.

Governor-elect Eugene Talmadge died on Dec. 21, 1946. The Georgia constitution of 1945 was not clear on the question of succession in this case, so the year 1946 closed with the people uncertain whether the governor after Jan. 14, 1947, would be Melvin E. Thompson (lieutenant governor-elect), Herman Talmadge (son of Eugene, campaigning for election by the general assembly), or Ellis G. Arnall.

State officials at the end of the year 1946 were: governor, Ellis Gibbs Arnall; chief justice, W. Frank Jenkins; secre-

PRINCIPAL FIGURES in Georgia governorship contest in 1946. Left to right: Ellis G. Arnall, former governor; M. E. Thompson, lieutenant governor; Herman Talmadge

tary of state, Ben W. Fortson; commissioner of agriculture, Tom Linder; superintendent of schools, M. D. Collins; attorney general, Eugene Cook; state auditor, B. E. Thrasher, Jr.; director of dept of highways, Ryburn Clay; treasurer, George B. Hamilton; comptroller general, Zach D. Cravey. United States senators from Georgia were Walter F. George and Richard B. Russell, Jr.

Education.—For the school year ending in June 1946, there were 4,745 elementary schools (1,776 for white children and 2,969 for Negroes) with an enrolment of 601,170 pupils (372,667 whites and 228,503 Negroes) and a teaching staff of 15,864 (9,962 whites and 5,902 Negroes). High schools numbered 1,333 (793 white and 540 Negro) with a student enrolment of 144,722 (114,114 white and 30,608 Negro) with a teaching staff of 6,314 (5,033 white and 1,281 Negro). In the fall quarter, 1946, there were 22,651 students enrolled in the 18 divisions of the university system of Georgia (including 1,718 in 3 Negro colleges). The state of Georgia increased its annual appropriation for educational purposes threefold in 15 years (\$23,296,537 in 1945).

Social Insurance and Assistance, Public Welfare and Related Programs.—As of June 30, 1945, there were 67,044 persons who received \$9,058,771.50 in old age assistance; 9,987 dependent children, benefits, \$1,181,961; 2,030 blind, benefits, \$348,562.50.

Unemployment benefits paid in Georgia from Jan. 1, 1939, to Oct. 20, 1945, inclusive, amounted to \$18,001,084.67. Payments issued from Jan. 1, 1945, to Oct. 20, 1945, inclusive, amounted to \$1,481,796 and were paid to approximately 20,000 persons. As of Oct. 20, 1945, the state of Georgia had

a balance in the unemployment compensation trust fund of \$79,504,795.74.

The following budget allotments were made for welfare institutions for the fiscal year ending June 30, 1945: board of pardons and paroles, \$97,176.12; prisons, state department of corrections, \$766,131.16; public welfare benefits, \$5,424,566.32; state institutions \$2,564,886.79.

At the Milledgeville State hospital on June 30, 1945, there were 8,442 patients; at the Boys Training school, 287; the Girls Training school for whites, 110; the Girls Training school for Negroes, 17; the Georgia Training school for mental defectives, 422.

Communications.—On Nov. 9, 1946, Georgia had 89,536 mi. of unpaved roads and 10,005 mi. of paved roads. Expenditures by the state highway department for the fiscal year ending June 30, 1946, were \$7,129,115 for maintenance and \$6,698,801 for construction. On Nov. 5, 1946, there were 6,442 mi. of main-line railroad track in the state, of which 266 mi. were double-tracked; in addition there were 2,254 mi. of yard-switching and passing track. Georgia had 958 mi. of developed navigable river channels.

Banking and Finance.—There were in Georgia on June 26, 1946, a total of 262 state banks and 7 branch banks with total resources of \$725,840,440 including \$347,928,030 in U.S. government securities, \$180,442,732 in loans and discounts and \$167,765,479 cash in vaults and amounts due from approved reserve agents. Liabilities of these banks included \$498,230,595 in demand deposits, \$97,941,701 in savings deposits and \$39,699,273 in time certificates of deposits. On Dec. 31, 1945, there were 92 credit unions (located in 18 cities) under the supervision of the state department of banking.

On June 29, 1946, there were 49 national banks in Georgia with total loans and discounts of \$226,003,000; demand deposits \$857,408,000; time deposits \$166,860,000.

In Dec. 1946, there were in Georgia 65 associations of the savings and loan or building and loan type with resources estimated at \$110,000,000. Forty-four of these associations operated under federal charters.

On Sept. 30, 1946, the state auditor gave the following statement of conditions of Georgia's finances: *Assets:* cash in state treasury \$27,869,341.63; cash and cash items in hands of state departments \$35,409,537.89; cash due from U.S. government on reimbursements \$1,741,824.42; total assets \$65,020,703.94. *Liabilities:* current accounts payable \$4,847,665.30; reserves (for commitments outstanding, highway contracts to mature, etc.) \$59,610,663.44; total liabilities \$64,458,328.74. *Surplus:* \$562,375.20.

Agriculture.—The value of all Georgia crops produced in 1946 was \$419,479,000. This was 7% more than the 1945 total and was exceeded only by the record high valuation of \$578,000,000 in 1919. Higher prices rather than increased production accounted for the high valuation. A 17% smaller production in cotton, the leading crop, yielded a 20% increase in value. Georgia's yield of peanuts was again far ahead of all states.

The total cash receipts from farm marketing in Georgia for the year 1945 (latest complete figures) amounted to \$374,143,000 (crops \$261,454,000; livestock \$112,689,000). The value of farm products consumed at home was estimated as \$104,006,000. Including government payments of \$10,221,000, the U.S. dept. of agriculture estimated the total value of Georgia's agricultural products for 1945 at \$488,380,000. The principal crops of 1946 are shown in the accompanying table:

Leading Agricultural Products of Georgia, 1946 and 1945

Crop	1946	1945	Value, 1946
Cotton, bales	555,000	669,000	\$94,905,000
Cottonseed, tons	219,000	268,000	14,673,000
Corn, bu.	44,145,000	48,386,000	75,488,000
Peanuts, lb.	730,300,000	722,250,000	64,266,000
Tobacco, lb.	114,747,000	105,975,000	50,262,000
Oats, bu.	16,404,000	17,722,000	18,372,000
Peaches, bu.	6,204,000	8,091,000	18,302,000
Hay, tons	736,000	813,000	16,192,000
Potatoes, sweet, bu.	7,020,000	6,970,000	15,444,000
Commercial truck crops			13,639,000
Velvet beans, tons	286,000	303,000	9,724,000
Sugarcane syrup, gal.	4,025,000	4,564,000	7,245,000
Pecans, lb.	16,000,000	36,850,000	6,461,000

Manufacturing.—Notable factors in the growth of industry in Georgia in late years were the introduction of the manufacture of newsprint from slash pine and the expansion of textile mills. From 1940 Georgia produced 60% of the nation's naval stores. On Dec. 15, 1946, the State Agricultural and Industrial Development board estimated the number of manufacturing establishments in Georgia as more than 4,000, employing 255,900 workers. The wages paid were \$452,173,332 in 1945 as compared with \$132,188,496 in 1939. The value of manufactured goods was \$677,402,657 in 1939 (latest available figure).

Mineral Production.—In 1944 (latest complete year) Georgia produced 27 different minerals and mineral products including 80% of the kaolin produced in the United States. Value of mineral and mineral products was \$20,195,547, of which \$19,192,547 came from nonmetallic minerals. Clays and clay products headed the list of values \$6,954,021; stone was second \$5,037,596. Metallic minerals were valued at \$1,003,000; coal \$85,000. The industrial and municipal water produced was valued at \$2,000,000, and water used in hydroelectric installations \$31,700,460.

Minerals produced included agricultural lime, asbestos, barite, bauxite, cement, clay, coal, fuller's earth, gold, granite, iron ore, kyanite, lime, limestone, magnesium sulphate, manganese ore, manganiferous ore, marble, mica, ochre, peat, sand and gravel, silica, slate, stone, talc and amber. (A. B. S.)

German Literature. After years of intellectual regimentation and isolation Germans in 1946 showed an insatiable demand for new reading matter. Nearly 100 good newspapers and a score of literary and artistic periodicals were appearing. Several old publishing firms decided to leave Leipzig in the soviet zone and establish themselves in the U.S. zone at Wiesbaden, which became a most important book centre. Notable books of the year were Ernst Wiechert's *Die Jerominkinder*, Friedrich Meinecke's *Die Deutsche Katastrophe* and works by Alfred Doeblin, Erich Kaestner, Anna Seghers, Golo Mann and Veit Valentin. Novelist Hermann Hesse received the Nobel prize. (S. B. F.)

Germany. A country under Allied military government, in central Europe, extending from the Alps to the North and Baltic seas, and lying mainly between the Oder and Rhine rivers. Capital, Berlin (*q.v.*). Chief cities (1939 census): Berlin (4,332,242); Hamburg (1,692,695); Munich (828,355); Cologne (768,426); Leipzig (701,606); Essen (659,871); Dresden (625,174); Frankfurt-on-Main (546,649); Duesseldorf (539,905); Dortmund (537,000). The population of all these cities was considerably reduced as a result of World War II. Religion (1933): Protestants 62.7%; Roman Catholics 32.5%; Jews 0.7%; others 4.1%.

Area and Population.—The area of military-occupied Germany was 143,243 sq.mi., with a population (census of Oct. 29, 1946) of 65,910,999. The Allies divided the country into four military zones, with areas and populations on Oct. 29, 1946, as follows: soviet zone (46,584 sq.mi.; pop. 17,313,581) lying largely between the Elbe and Oder rivers and including most of Brandenburg, Mecklenburg and the industrial Saxon and Thuringian lands; British zone (42,724 sq.mi.; pop. 22,794,655) stretching across north Germany from Luebeck and the Baltic sea to the Dutch and Belgian frontiers; and mostly made up of Prussian lands; U.S. zone (36,869 sq.mi.; pop. 16,682,573) comprising Bavaria and west central Germany but not the Bremen enclave; the relatively small French zone (16,727 sq.mi.; pop. 5,939,807) including two triangular districts comprising western Wuerttemberg and southern Baden in the southwest and the Saar and southern Rhineland in the west; and Berlin (341 sq.mi.; pop. 3,180,383) under joint Allied administration.

The Allied generals announced on June 6, 1945, that for the purposes of military government Germany's frontiers would be considered those of 1937. The Berlin conference of Aug. 2, however, stated that, in accordance with understandings reached at Tehran and Yalta, Koenigsberg and the eastern tip of East Prussia would be administered as part of the soviet union, and the rest of the former German territory east of the Oder and Neisse rivers would be administered as part of Poland. But it was agreed that these boundaries of eastern Germany were only provisional and would be finally settled only at some future date when a peace treaty with Germany was made. This German territory east of the Oder comprised 39,000 sq.mi. and had in 1939 a population of 9,700,000. Poland's part included the rest of East Prussia, part of Brandenburg and most of Pomerania and of the rich industrial province of Silesia. Although these arrangements were only provisional, the U.S.S.R. removed to the soviet union able-bodied German men for labour service in the U.S.S.R. Poland uprooted much of what was left of this German east-of-the-Oder population—mainly destitute women, old men and children—and deported them to the truncated

CHILDREN lined up to buy carrots from a sidewalk heap in Hagen, Germany. Vegetables were one of the main items in the German diet during 1946

reich west of the Oder. Without homes, food, money or clothing except what they had on their backs, these deported Germans were pushed mainly into the British and U.S. military zones, which consequently had in 1946 a larger population than before the war (22,800,000 and 16,700,000 instead of 21,400,000 and 13,800,000; see table below).

In addition, there were deported into Germany west of the Oder several million German-speaking persons who had lived for generations in Danzig, the Polish Corridor, Czechoslovakia or Hungary, or who had been transplanted by Adolf Hitler during World War II from the Baltic provinces and the Austrian Tyrol and given new homes in nazi-conquered lands. In addition, there were still in Germany in 1946 about 800,000 "displaced persons," mainly Poles, Baltic Germans and some Russians, who hated and feared the bolsheviks and violently resisted repatriation to their original homes to avoid again becoming subjected to soviet domination. The problems of the peace with Germany and its final frontiers were scheduled to be taken up by the Big Four council of foreign ministers at Moscow on March 10, 1947.

At the end of 1946 there were still detained outside Germany, living in concentration camps or performing labour services, about 4,000,000 German prisoners of war (supposedly more than 3,000,000 in the U.S.S.R., 620,000 in France, 40,000 in Belgium, 10,000 in the Netherlands and a few under the control of Britain and the U.S.). Their families naturally wanted to have them returned, and they were needed for German industry and agriculture. The U.S., in accordance with the Geneva convention, paid \$200,000,000 to German prisoners of war, or their dependents, as wages for work done while they were in the U.S. The U.S.S.R. recognized no such obligation. The number of Germans, members of the armed forces and civilians, killed in World War II was estimated at between 4,000,000 and 5,000,000.

Not included in the above statistics was the Allied military and civilian population in Germany. In the summer of 1946 they were approximately: U.S. 290,000; British 350,000; soviet

725,000 and French 60,000. By the end of 1946 they had been reduced considerably further.

Germany in 1937, and in 1946 with Military Zones

	Area in thousands of sq.mi.	Pop. in Millions		Agriculture and Industry in 1937				
		1939	1946	Thousands sq.mi.	Forest	Plowland	Mil. Tons Coal	Mil. Tons Lignite

Germany 1946 . . .	143.2	—	65.9	38.1	53.6	?	?	?

*Insignificant amounts. Figures based in part on U.S. Department of State Bulletin, no. 354 (April 14, 1946).

History.—The history of Germany in 1946 is the dismal story of the struggle for food, clothing and shelter; of Allied measures for denazification and the destruction or removal of industrial plants and of the more cheerful laying of the basis for democratic government.

The German food problem in 1946 was made acute mainly by two factors: loss of rich agricultural lands and the crowding of a larger population into a smaller area. As indicated in the table, the territory east of the Oder (39,000 sq.mi.) that Germany practically lost was more than one-fifth of its prewar territory. It was Germany's breadbasket. It provided before the war about 28% of the total domestically produced food supply—31% of the rye, 24% of the wheat, 25% of the barley, 24% of the oats, 29% of the potatoes and 29% of the sugar beets. It supplied a large part of the food for the cities and industrial populations of central and western Germany. But none of the produce raised there came to the rest of Germany in 1946. The soviet zone was also largely agricultural and before the war sent much of its food to central and western Germany; but in 1946 almost none was sent, because of the rigid zonal barriers preventing exchange of goods and because the Russians sent much of it home to the U.S.S.R. Thus, the three western military zones got none of the food supply on which they had been largely dependent in the past. Moreover, owing to the great influx of deportees from the east, Germany west of the Oder had a crowded population of 65,900,000 instead of the 59,900,000 who lived in the same area in 1939. There were 6,000,000 more mouths to feed, but less than three-quarters of the formerly home-produced food to give them. Germany had imported part of its food in prewar days, but importation was no longer possible in 1946 because Germany was virtually bankrupt and Allied reparations policies prevented it from manufacturing goods for export in sufficient quantity to pay for food imports. If the U.S. had not sent \$200,000,000 worth of food, and the British nearly twice as much, hundreds of thousands of Germans would have died of starvation in 1946.

Shelter was a serious problem because 20%–60% of the houses in the larger cities had been destroyed or damaged by Allied bombing during the war. People had to live in cellars or in greatly overcrowded rooms. German families, made responsible for feeding and giving shelter to the millions of Germans deported into the country, had to take them, often unwillingly, into their own already crowded houses. The housing shortage was also made worse by the fact that the Allies took over a good many of the best houses for their own civilian and military personnel. Some clothing was provided by foreign donations of old clothes, but most Germans shivered in worn out or tattered suits of earlier years and often had no shoes at all.

The punishment and removal from office and influence of all active nazis was carried forward with varying rigour and consistency in the four military zones, most thoroughly in the U.S. zone and least so in the soviet zone, with the French and the British taking an intermediate course. The Russians were generally satisfied to leave former nazis in positions of influence if

they showed docility in accepting communist principles and leadership, i.e., "decontamination by absorption." On Oct. 13 the Allied Control council adopted unified denazification rules for all four zones which virtually codified the measures already in operation in the U.S. zone. All Germans had to fill out elaborate questionnaires about their former positions, incomes and nazi affiliations. On the basis of the answers they were divided into five classes: (1) major offenders, including "war criminals" responsible for outrages in concentration camps, unjust arrests and propagandist support of the nazi tyranny; (2) militarists and profiteers; (3) lesser offenders; (4) mere followers and (5) those adjudged free of nazi taint. Denazification had at first been tried by officers of the U.S. military government, but in May 1946, the work was turned over to courts made up of Germans who did not like the job but were compelled to accept the responsibility. These courts did not give thorough satisfaction to the U.S. officials. Nevertheless, they were continued and the day before Christmas Gen. Joseph T. McNarney, the U.S. commander in Europe, said he was "heartened by their increased effort," and at the same time announced a sweeping amnesty for about 800,000 "little nazis" in the U.S. zone. He hoped that this amnesty would free the German courts from a multitude of minor cases so that they could proceed more rapidly to trying the major and more dangerous nazis who had brought destruction on their country. He also hoped the amnesty would do much to promote a feeling of reconciliation and a democratic reconstruction of Germany.

The Allied policy of taking reparations through the removal from Germany of machinery and factory equipment was slowed down during 1946 because of its evident disastrous effects on the Germany economy. It had been agreed in the Berlin conference of 1945 that Germany should be treated as an economic whole with a unified structure, but owing to soviet and French obstruction this agreement had not been carried out. Secy. James F. Byrnes made a great speech at Stuttgart on Sept. 6 emphasizing the need of throwing down the zonal barriers which made trade between the different zones more difficult than that between foreign countries. Since he had not been able to bring the Russians and the French to his views, he made an agreement with the British practically establishing an economic merger between the British and U.S. zones. It was expected to promote their prosperity by permitting the free exchange of goods between the two zones; the two countries agreed to furnish raw materials and food, sharing equally the expense, to put Germany on its feet again, though not to make it any better off than the other European countries that the nazis plundered and enslaved. It was calculated that by 1950 Germany would have become self-supporting, though on a low level of subsistence, and that thereafter Britain and the U.S. would not have to go on supporting that country. The Anglo-U.S. merger went into effect

CARICATURES of former nazi leaders being carried by boys in an S.E.D. (Socialist Unity) party election parade in Potsdam, Germany, during 1946

"NOT EASY TO TEACH A HALF A DOG NEW TRICKS" observed Shoemaker of the *Chicago Daily News* in 1946, referring to the division of Germany into separate occupied zones

on Jan. 1, 1947, and the Russians and French were invited to join in it.

In the development of self-government, as in denazification, the greatest progress was made in the U.S. zone. Elections were held first in villages, then in larger towns and districts and finally for constitutional conventions in each of the three states or *Laender*: Bavaria, Wuerttemberg-Baden and Greater Hesse. Constitutions were drawn up by each convention and then adopted by referendum votes. They differed in details but were alike in providing guarantees of personal and religious freedom, justice and the rule of law and in favouring the socialization of mines, forests and many public utilities and businesses. This building up of democratic institutions on the lower local levels paved the way for the eventual adoption of a federal constitution for all Germany, as soon as similar constitutions had been adopted in the other three zones.

Education.—During 1946 the greater part of the children were again being given some elementary and secondary education, though often for only half a day instead of a full day on account of the shortage of school buildings and qualified teachers. In the soviet zone children were taught communism, but in the three western zones democratic ideas. In many places U.S. instructors tried to improve morale by teaching youth games like baseball and football, but the country was still plagued with a great deal of juvenile crime and delinquency.

Ten universities (Berlin, Jena, Goettingen, Heidelberg, Marburg, Hamburg, Kiel, Halle, Tuebingen and Freiburg) were again giving instruction, as well as several higher technical schools. All education was greatly hampered by lack of heated buildings and suitable textbooks, by shortage of paper and educational equipment of all kinds and by the difficulty of finding able and politically reliable teachers.

Defense.—World War II left Germany without an army, navy or air force. In some of the zones carefully screened and trained German police forces were recruited to aid the Allies in preserving order.

Finance.—The unit of currency is the German mark, nominally equivalent to 40.3325 cents, but actually hardly worth a quarter as much in 1946 because of the inflationary printing of new money. Measures were discussed for the creation of a new and stable currency which might come into effect when Germany was given the unified economic structure promised in 1945. Meanwhile, cigarettes formed a much-used medium of exchange, and a black market flourished in Berlin until it was replaced by a regulated barter market.

Trade and Communications.—These were at a very low level during 1946. The division of Germany into four military zones almost completely prevented the sending of goods from one zone to another. Shortage of railway rolling stock and of gasoline for trucks made it difficult to move goods even within a single zone. Postal, telephone and telegraph service, however, was restored between the zones and with foreign countries toward the end of 1946.

Agriculture, Manufactures and Mineral Production.—There were few satisfactory statistics on these subjects for 1946, and conditions varied greatly from zone to zone. The loss of the agricultural land east of the Oder and its effects on the food question have already been indicated. Agriculture within Germany suffered much from lack of fertilizers, transportation facilities and able-bodied workmen.

Manufactures were greatly crippled by the Allied policy of destroying or removing from Germany industrial machinery to pay reparations; by its restriction of German steel output to 5,800,000 tons annually, as

compared with 23,000,000 tons produced in 1937, and by lack of coal. In losing Silesia to Poland, Germany lost one-sixth of its hard coal production and one-twelfth of its lignite production. The great coal fields were in the British Ruhr district, but because of the physical weakness of the miners resulting from insufficient food, coal production at the end of 1946 had risen to only one-third of the prewar figure. In the Saar coal fields, however, the French, by giving miners more food, actually increased production beyond the prewar annual output of 13,000,000 tons; practically all of it was used by the French. In spite of the shortage of these two basic materials—steel and coal—by Dec. 1, 1946, in the U.S. zone, mining, metal, chemical and lumber industries averaged close to 50% of the 1937 level of production, while the lighter industries, such as textiles, ceramics, leather and paper, lagged behind at about 37% of 1937. Ghavam-es-Saltaneh, Ahmad (1872?–), Iranian statesman, was born of an aristocratic landowning family and inherited vast estates in Azerbaijan province. Ghavam was premier from June 1921 to Jan. 1922 and from June 1922 to Feb. 1923. Following his second tenure, he was banished from the country on a charge of plotting against the life of the Reza Shah. Permitted to return in 1929, he re-entered public life. He again became premier in June 1942, but resigned the following February because of the Tehran bread riots.

On Jan. 26, 1946, Ghavam was named premier for a fourth time. He visited Premier Stalin in Moscow (March 1946) to discuss the overdue withdrawal of Red army troops from Azerbaijan, and on March 15, 1946, he notified the Big Three that he intended to appeal to the U.N. Security council against continued presence of Red army troops on Iranian soil.

However, his government sent conflicting and bewildering orders to Hussein Ala, the Iranian envoy in Washington and delegate to the U.N. Ghavam blew hot and cold regarding the crisis with the U.S.S.R. On several occasions he endorsed Hussein Ala as Iran's official representative and then rescinded Ala's authority to speak for Iran.

After withdrawal of Iran's case from the Security council agenda, Ghavam declared (May 9, 1946), that the interest of the United Nations in Iran had been a "great help to the country during critical times."

Girl Scouts. In 1946 the Girl Scouts strengthened their program of international friendship. Realizing the many problems which the peace would bring, they pledged themselves to continued service to home and country, as well as to helping their sister Scouts and Guides around the world. They sent Friendship Bags, food packages, funds and scouting equipment to Scouts and Guides in all parts of the world.

The first postwar international encampment of Girl Scouts and Girl Guides was held at the Chalet at Adelboden, Switzerland, in the summer of 1946. Two girls from each country attended in official uniform and days were spent cementing friendships and discussing the problems of scouting and what the girls themselves could do to help keep the peace.

Shortly before the opening of the international encampment, Girl Scout Troop 65 of Wash., D.C., sailed for England to work with the British Girl Guides in camps around the country. Troop 65 conceived the idea of paying a working visit to Eng-

land early in 1943. They earned passage for the trip by doing odd jobs such as dish washing, baby sitting and tutoring. They camped out on the Maine coast under the most primitive conditions, learning how to make do with the barest essentials of camping equipment and generally getting used to the conditions they anticipated finding in war-ravaged England. When they finally left for England, they took with them tents, tools and cooking utensils. They also carried 25 lb. of food for each girl, so that they would not use up the meagre food supplies of their British hostesses. Troop 65 worked with many different groups of Guides and were welcomed wherever they went. They helped set up and run camps for and with Girl Guide companies, Sea Rangers, companies of handicapped girls and many others.

The total registration as of Sept. 1, 1946, was 1,213,913 Girl Scouts. The World Association of Girl Guides and Girl Scouts had a total membership of about 5,000,000 girls. The new national president of the Girl Scouts, elected at the national convention at Atlantic City, N.J., in March 1946 was Mrs. C. Vaughan Ferguson of Schenectady, N.Y. Headquarters are at 155 E. 44th St., New York 17, N.Y. (C. M. R.)

Glands: see ENDOCRINOLOGY; MEDICINE.

Glass, Carter (1858–1946), U.S. politician, was born on Jan. 4 in Lynchburg, Va. For his early career, see *Encyclopædia Britannica*. He was a member of the house of representatives from Virginia, 1902–18, and served in the senate from 1919 until his death; for the brief period between these posts in congress he was secretary of the treasury. During his tenure in the house, Glass was a member of the Banking and Currency committee and an acknowledged authority on fiscal systems and financial theory. He was chairman of the committee at the time the Federal Reserve Bank act was passed and in later years became involved in the dispute over its authorship. In 1938, in a ceremony commemorating the 25th anniversary of its signing, Pres. F. D. Roosevelt paid tribute to Glass as “father” of the Federal Reserve act. The senator was again offered the post of secretary of treasury when Roosevelt took office as president, but declined, preferring to retain his seat in the senate. Although he actively participated in the emergency banking legislation enacted in the “first hundred days” of the New Deal (1933), Glass soon afterward broke with the president on fiscal policies and other domestic issues. He opposed the administration on devaluation of the dollar, the National Recovery act, relief spending policies and reorganization of the supreme court. In Sept. 1939 Glass ended his long opposition by supporting an amendment of the arms embargo provisions of the Neutrality law. He continued to endorse the president's foreign policies and in a senate statement in Jan. 1941 went so far as to propose declaration of war on Germany. Glass, who was called an “unreconstructed rebel” by the president, made his last appearance on the senate floor in June 1942. Thereafter illness prevented his attendance, but he was nevertheless re-elected for a fifth term. He died in Washington, D.C., on May 28.

Glass. The year 1946 marked the return of many workers from the armed forces to the plants and laboratories, the lifting of certain restrictions on fuel and raw materials and the resumption of automobile production in the United States with its consequent great demand for polished plate glass. Production increased about 6% in value over 1945, rising to an estimated total of \$550,000,000.

U.S. production of polished plate glass exceeded 200,000,000 sq.ft. for the first time after World War II began; more than

15,000,000,000 containers were made during the year. The serious deterrent to still greater production was the shortage of soda ash.

In England, the year witnessed technological progress in plate-glass manufacture, whereby both sides of plates are continuously ground and polished at the same time.

A leading figure in glass technology, Prof. W. E. S. Turner of Sheffield, retired from his teaching, although he continued as editor of the important journal of the Society of Glass Technology. Prof. Turner spent several months as a special lecturer on glass at a U.S. university.

The position of optical glass as a vital need for the military and naval forces was changed to its peacetime status as a minor product. Large stocks of blanks as well as finished lenses and prisms remained on hand.

Fibre glass and cellular glass, products which were made exclusively for war needs for some years, became available to the public. Numerous uses were being developed for them.

The general fact that U.S. and British glassmaking practice was at least not inferior to that of central Europe, was confirmed by the tour of H. H. Blau and C. J. Uhrmann, who studied the European factories and reported critically upon procedures and conditions.

In common with other industries, the glass industry found a dearth of trained men for research and development positions, because so many educational careers were interrupted by the drafting of college men into the armed forces. (S. R. S.)

Glennon, John Joseph, CARDINAL (1862–1946), archbishop of St. Louis and senior member of the U.S. Catholic hierarchy, died in the Dublin home of the president of his native Eire, March 9, on the eve of his golden jubilee as bishop and a bare fortnight after the Feb. 18 consistory during which Pope Pius XII had created and proclaimed him cardinal. His death, occasioned by the fatigues of the journey to Rome, brought to a close a distinguished sacerdotal and episcopal career which had come to be closely identified with the steady religious and civic development of the American midwest from reconstruction days through World War II. Born in Kinnegad, County Meath, on June 14, he was ordained priest at Kansas City, Mo., in 1884, served as vicar general of the Kansas City diocese, and was consecrated its coadjutor bishop June 29, 1896. Transferred to St. Louis as coadjutor to the archbishop April 27, 1903, he succeeded to that archbishopric Oct. 13, 1903.

An aggressive, outspoken defender of human rights in pulpit and press, at home and in both hemispheres abroad, Archbishop Glennon was widely esteemed for his eloquence, dignity and wit as orator and lecturer. But the major emphasis of his long pastoral apostolate went to work rather than to word. To provide for the needs of his St. Louis flock, numbering in 1946 500,000 souls, he brought vast ecclesiastical and social agencies into being, including 93 parishes with schools, the impressive Byzantine cathedral of St. Louis, major and minor seminaries, churches, welfare institutes, a modern medical centre comprising five major hospitals and five diocesan high schools in process of construction. Probably unmatched in history is his record of 4,700 ordinations to the priesthood, the consecration of 7 bishops and administration of the sacrament of confirmation to 225,000. His breadth of vision and deep human sympathy was given summary expression as World War II ended in a vibrant radio address appealing to Americans to “aid with our strength the rehabilitation of Europe, which has furnished us our language, literature, culture and faith,” as “with friendly hearts we receive our soldiers upon their return from the bitter experience of the blood and fever of war.” Cardinal Glennon is

buried beneath the main altar of his cathedral in St. Louis.

(J. LAF.)

Gliding. Gliding in 1946 once more reverted almost entirely to a civilian activity marked by the following events:

In the United States Franklin Hurtt and Richard Powell flying a Schweizer 2-22 set a new two-place duration record of 10 hr. and 9 min. on April 10, 1946, at Elmira, N.Y.

Paul Tuntland with 182 lb. of ballast soared a two-place Pratt Read to a new national two-place altitude record of 18,830 ft. on July 25, 1946, at Orlando, Fla.

Virginia Bennis (Mrs. Stephen) established a national single-place distance record for women, of 37 mi. in a Kirby Kite on Aug. 4, 1946, at Elmira, N.Y.

John Robinson set a national single-place goal and return record of 100 mi. in his Zanon on Aug. 14, 1946, at Elmira, N.Y.

Richard Johnson and Robert Sparling flew their Schweizer TG-2 to a two-place national record distance of 314 mi. from Prescott, Ariz., to Governador, New Mexico, on Sept. 8, 1946.

The total of Golden "C" pilots in the U.S. was raised to six when the Soaring Society of America granted a Golden "C" to Raymond Parker.

The Soaring Society of America resumed its National Soaring contests which were halted by the war with the holding of its 13th National Soaring contest Aug. 3-18, 1946, at Elmira, N.Y. Forty-nine gliders were entered in the contest; 68 pilots competed. A total of 6,397 mi. were flown in 375 hr. of soaring. John Robinson earned the title of National Soaring Champion for the third consecutive time.

During 1946 for the first time in the U.S., gliders were used as instruments of meteorological research. Dr. Horace Byers, director of the thunderstorm project of the U.S. weather bureau, invited the Soaring Society of America to participate in this thunderstorm research program by providing sailplanes and pilots. Twelve flights were made in thunderstorms in Florida during the summer of 1946. The analysis of the data gathered was not expected to be complete before the latter part of 1947.

In England the British Gliding association was reactivated on March 1, 1946. A new national single-place altitude record of 15,247 ft. was established by P. A. Willis on June 23, 1946. A general conference of the international gliding and soaring body the Federation Aeronautique Internationale was held in London during the month of September. The main purpose of this meeting was to re-establish the Federation Aeronautique Internationale which had been dormant during the war years.

The Allied occupation forces in Germany made use of the German gliding facilities and equipment. The royal air force sponsored at least three gliding schools, at Heston, Oerlinghausen and Scharfoldendorf. A group of enthusiasts in the U.S. army used the gliding facilities at Kirchheim.

G-Men: see FEDERAL BUREAU OF INVESTIGATION.

Goddard, Rayner Goddard, BARON OF ALDBOURNE (1877-), lord chief justice of England, was educated at Marlborough and Trinity college, Oxford, and called to the bar in 1899. Hard work in Clavell Salter's chambers and an exceptional memory brought him a large commercial and banking law practice. He gained wide experience of criminal matters as a recorder (Poole, 1917-25, Bath, 1925-28 and Plymouth, 1928-32), as a judge of the King's Bench division of the high court (1932-38) and as president of two important public inquiries into the exercise of powers by justices of the peace. He was appointed a lord jus-

tice of appeal and privy councillor in 1938, and a law lord and life peer in 1944. His appointment as lord chief justice in 1945 was nonpolitical, contrary to custom. By July 1946 he had succeeded by outstanding administrative ability, brisk power of decision and determination that justice should be expeditious, in causing all common law cases to be tried as soon as they were ready for hearing, and so shortening their duration often by many months. He effectively supported the strict and impartial observance of the criminal law in all courts and discouraged criminal appeals on trivial or merely technical grounds.

(A. L. C.)

Goering, Hermann Wilhelm (1893-1946), German politician, was born on Jan. 12, in Rosenheim, Bavaria. For his early career see *Encyclopædia Britannica*. A former air ace of World War I, Goering joined the nazi party in its infancy. He became president of the reichstag in Aug. 1932 and after Hitler became chancellor in Jan. 1933 Goering was promoted to reich minister for air, Prussian minister-president and minister for the interior.

As Hitler's "strong-arm" man he was charged with consolidating nazi power and increasing German armed might. He developed the gestapo, created the first concentration camps and played a leading role in the Roehm purge of 1934.

Goering was named plenipotentiary for the four-year plan in 1936, becoming, with Hitler's assent, economic dictator of the reich. In 1937 he embarked on a broad program to increase the effectiveness of the luftwaffe and to speed rearmament. Goering also originated, by his own admission, the plot for annexation of Austria in 1938 and played a prominent part in the Sudetenland seizure and in the invasion of Poland. On July 19, 1940, Hitler conferred on him the newly-created title of reich marshal. He commanded the luftwaffe during the unsuccessful blitzkrieg against England, 1940-41. Goering disapproved of the invasion of Norway because he had not received sufficient advance notice, but had an active part in planning the aggressions against Greece and Yugoslavia.

At the Nuernberg trial, Goering declared that while he regarded the soviet union as the "most threatening menace to

HERMANN GOERING conferring with his lawyer through window in the prisoners' enclosure screen, in the Palace of Justice at Nuernberg, during his trial in 1946

Germany," he objected to the attack on that country because of its timing, explaining that he had wanted to delay the offensive until Great Britain had been conquered.

While Hitler remained in Berlin during the closing phase of World War II in Europe, Goering escaped to Berchtesgaden. Because of his flight he was "excommunicated" by Adolf Hitler. On May 8, 1945, he surrendered to U.S. army forces near Salzburg. He was the leading nazi defendant that stood trial as a war criminal before the international military tribunal at Nuernberg.

The Nuernberg court, in delivering its verdict, described the reich marshal as the moving force second only to Hitler as a "leading war aggressor"; it asserted: "his guilt is unique in its enormity. The record discloses no excuses for this man." The tribunal found him guilty of all four counts on Oct. 1, 1946, and sentenced him to death by hanging. Several hours before his execution was to have taken place on Oct. 15, Goering killed himself by swallowing poison. How he secured the poison remained a mystery.

Gold. It was almost inevitable that with the end of lend-lease the situation would return to one in which the United States showed a favourable balance of trade on current account with respect to the rest of the world, and that this would bring with it a reversal of the international gold movement. It was not surprising, therefore, to find that between the end of 1945 and Nov. 30, 1946, gold stocks of the United States increased from \$20,065,000,000 to \$20,470,000,000, or by \$405,000,000.

§Not available.

||Gold under earmark at Federal Reserve banks for foreign account on Nov. 30, 1946, amounted to \$3,911,200,000. Gold under earmark is not included in U.S. gold stocks.

GOLD PRODUCTION: world total and output of the principal producing countries, as compiled by *The Mineral Industry*

The change of direction of the gold flow actually set in in Dec. 1945, U.S. gold stocks having reached their low for this movement at the end of Nov. 1945, when they stood at \$20,030,000,000. Detailed figures on this movement were available at the end of 1946 only through October. These indicate that the change manifested itself almost entirely in the form of releases of gold from stores earmarked for foreign accounts rather than in a physical transfer of the metal. (See also FEDERAL RESERVE SYSTEM.)

(E. H. Co.)

World Production.—War conditions made data on gold production inaccessible from Europe and Asia, as well as parts of Africa and Oceania. Total output was difficult to determine in 1946, as neither Japan nor the U.S.S.R. had reported production for a decade, and world totals were estimates. The available data from the more important producing countries are in Table II.

Table II.—World Production of Gold
(Thousands of fine ounces)

	1940	1941	1942	1943	1944	1945
United States	4,863	4,832	3,583	1,381	1,022	929
Canada	5,311	5,345	4,841	3,651	2,923	2,662
Mexico	883	800	801	632	509	449
South America	1,880	1,747	1,604	1,442	1,354	1,246
India	289	286	260	252	228	170
Belgian Congo	555	561	500	453	400	381
Gold Coast	886	885	784	565	534	475
Southern Rhodesia	826	790	760	657	593	568
South Africa	14,097	14,407	14,121	12,800	12,277	12,214
Australia	1,644	1,497	1,154	751	658	635
Total (est.)	42,153	40,291	35,514	29,429	27,070	23,930

The chief producer affected by direct war activities was the Philippines, but production in several less important countries was also involved, especially Korea, Papua and New Guinea. Production was maintained throughout World War II with relatively little change in South Africa, where reductions in output amounted to only about 15%, but in most other countries the reductions were greater. In the United States and Canada gold production was purposely limited by government action, but elsewhere the declining outputs resulted from shortages of labour, equipment and supplies, as well as from rising costs.

Widespread declines in output continued in 1945. Every major country reported in the above table showed decreases, and only two or three minor producers made increases.

United States.—Restrictions on the operation of gold mines that had been ordered by the War Production board in 1942 were rescinded on July 1, 1945, but recovery in output was delayed for several months while the mines were being put back into working condition and the necessary labour force was recruited. A monthly output of 67,795 oz. in June 1945 had increased to 98,328 oz. in November, but of the year's total of 928,873 oz., 45% was produced in the first half of the year and 55% in the second half. A decline in output from November brought the Feb. 1946 figure down to 84,226 oz., after which recovery set in, but it took until May to work back to the Nov. 1945 level. The beginning of real improvement in gold production started with 113,373 oz. in May and advanced to 177,240 oz. in September, but declined to 152,956 oz. in October. The total for the 10 mo. was 1,216,289 oz., equivalent to an annual rate of 1,460,000 oz., a figure which would probably be advanced somewhat by further improvement in November and December.

Canada.—Gold production in Canada started to improve at midyear of 1945, as in the United States, but the recovery was slower—2,128,903 oz. in the first three-quarters of 1946; this figure is equivalent to an annual rate of 2,860,000 oz., 7% more than the 1945 average, but less than in 1944. (See also EXCHANGE CONTROL AND EXCHANGE RATES; MINERAL AND METAL PRODUCTION AND PRICES.)

Gold Coast: see BRITISH WEST AFRICA.

Golf. Of the four major United States Golf association championships held in 1946 only one, the women's, was poorly attended, due, no doubt, to the fact that it was held at a spot remote from the main golf centres.

First major event of the year was the Open, played at the Canterbury club, Cleveland, and won by Lloyd Mangrum, purple-heart wearer from Los Angeles, after a double play-off with Byron Nelson and Vic Ghezzi. At the end of regulation 72-holes the three were tied with a score of 284. The first play-off round found them still deadlocked with 72s, but on the next trip Mangrum won the title with a 72, Nelson and Ghezzi again tying with 73s. It was perhaps the most dramatic finish there ever was in the championship with a half-dozen others in the running up to the final hole. Except for a bad break that came when his caddie inadvertently stepped on his ball, causing him to take a penalty stroke, Nelson would have been returned the winner of the championship. Mangrum appeared to be out of the running until he dropped a sensational 90-ft. putt on the

ninth green to save himself, the ball bouncing a foot into the air after hitting the back of the tin and then falling back in to save him at least one and perhaps two extra strokes. This happened in the first play-off round.

Attendance at the open was the greatest in the history of the championship, an opening-day crowd of 9,000, largest in history, turning out to witness the revival of the championship after a five-year lapse. Attendance for the four days of the championship represented an all-time high. The amateur didn't fare quite so well, although it, too, brought out a gallery second in size only to those that used to trudge around after Bobby Jones when he was monarch of all he surveyed.

Played at the Baltusrol Golf club where Jones suffered defeat by George Von Elm in the 1926 final, thus preventing the Georgian from winning the championship five times in a row, the championship drew perhaps the greatest field ever to vie for the title. Most of them were newcomers since it was last played and it was one of these who gained the crown, Stanley E. (Ted) Bishop, lanky New Englander from Natick, Mass.

In the final, Bishop defeated Smiley Quick, short, thick-set Californian who previously had won the U.S. public links title besides being runner-up in the Western amateur. Tensely-fought from beginning to end, the battle ended on the 37th green when Quick missed a 30-inch putt for a half. Indications of what was in store came in the qualifying test in which Skee Riegel of Glendale, Calif., set a new championship record by touring the course in 136 strokes (69 and 67) to pare three strokes off the former qualifying mark made by Tom Sheehan at the North Shore club, Chicago, in 1939. Considerable havoc resulted when the authorities decided to make the pairings "out of the hat," resulting in the early downfall of many of the stars, one of them being Marvin (Bud) Ward, holdover champion, who lost to Charles (Bebe) Lind, Denver university student, in the third round.

Similar fates befell Frank (Muscles) Stranahan of Toledo and Capt. Cary Middlecoff of Memphis, a pair of newcomers who were listed as favourites to gain the title.

The women's championship went to Mildred (Babe) Didrikson Zaharias of Denver, rated one of the finest woman golfers ever to swing a club. It marked her first triumph in the national, but the ease with which she defeated her opponents on the way to the final where she beat Mrs. Clara Callender Sherman of California, 11 and 9, indicated that it would not be her last. She and Louise Suggs of Lithia Springs, Ga., were in 1946 head and shoulders above anyone else in the women's sphere.

A total of 5,720 golfers entered the four championships conducted by the United States Golf association, 1,040 more than the previous high in 1940. The public links championship alone attracted 3,586 entries, surpassing the record of 2,816 established in 1941.

Another organization which enjoyed great prosperity in 1946 was the Professional Golfers association, the organization of the pros. Pursuing the policy it had carried out in all but one of the war years, namely that of conducting tournaments throughout the country, the P.G.A. held one or more tournaments every week during the year, the total prize money put up for the touring pros to shoot at being near the \$500,000 mark.

Little Ben Hogan gathered in the lion's share, his year's winnings amounting to \$42,556.10. Altogether he won 13 of the 45 P.G.A. sponsored tournaments (the total prize money was \$484,000). One of his victories came in the P.G.A. championship.

The year also saw the major British championships revived for the first time since 1939 with Sam Snead going over to win the British open, James Bruen taking the British amateur and Mrs. George W. Hetherington the British women's.

An American, George Fazio of California, also won the Ca-

CHARLES BOSWELL, blinded World War II veteran who shoots near-par golf. He tees off with the aid of a companion, who adjusts the position of the club head with respect to the ball, and steps back to let Boswell swing

nadian open, while Henry Martell, Edmonton, Alberta, policeman, won the Dominion amateur.

The biggest haul ever made by any one golfer in a single tournament came in 1946 when Herman Barron, White Plains, N.Y., pro, won the \$45,000 All-American open, his share being \$10,500.

Herman Keiser of Akron, O., won the Masters, first "dark horse" ever to gain that coveted honour. (W. D. R.)

Göring, Hermann Wilhelm: see GOERING, HERMANN WILHELM.

Gorizia: see TRIESTE.

Gort, John Standish Surtees Prendergast

Vereker, 6TH VISCOUNT (1886-1946), British army officer, was born in July, the son of the 5th viscount, whom he succeeded in 1902. He was educated at Harrow and Sandhurst and joined the Grenadier guards as second lieutenant in 1905. He served throughout World War I, was wounded, and received the Victoria cross, the Military cross and the Distinguished Service order with two bars. After the war, he taught in the army staff college and the senior officers' school, was appointed commander of the Grenadier guards, 1930, and was in India as director of military training, 1932-36. In 1937 he was appointed military secretary to the secretary of state for war, with the local rank of a lieutenant general. He was named chief of the British Imperial General staff, 1937, and commander in chief of the British Expeditionary force to France, 1939. King George VI commended him for his handling of the Flanders retreat and the Dunkirk withdrawal and decorated him with the insignia of a Knight of the Grand Cross of the Order of the Bath. In 1940 he was named inspector general to the forces for training, and in May of the following year he was made governor and commander in chief of Gibraltar, then threatened by the Germans and the Franco regime. In 1942 he was transferred to Malta, which was under heavy axis air attack, as

commander in chief of that island base. He was created a field marshal in 1943. Lord Gort became high commissioner and commander in chief for Palestine and high commissioner for Trans-Jordan, Oct. 31, 1944, but resigned on Nov. 2, 1945. He died in London on March 31.

Gouraud, Henri Joseph Étienne (1867-1946), French army officer, was born on Nov. 17 in Paris. For his early career see *Encyclopædia Britannica*. Gen. Gouraud, who had been promoted to temporary general of a division at the outbreak of World War I, served on the western front and at Gallipoli (where he lost his right arm). He played an important role in the stopping of the German offensive in the Champagne sector in July 1918. After the war, he was appointed high commissioner to Syria and commander in chief of the Levant (1919) and military governor of Paris (1924). He died in Paris on Sept. 16.

Government Departments and Bureaus.

The following are the leading officers of the more important government departments and bureaus of the United States. The date for the information is Dec. 31, 1946.

Department or Bureau	Name	Post
Department of State	*Byrnes, James F. ¹	Secretary
	*Acheson, Dean	Under-Sec'y
	Cohen, Benjamin V.	Counsellor
	*Benton, William	Asst. Sec'y
	Thorpe, Willard L.	Asst. Sec'y
	Hilldring, John H.	Asst. Sec'y
	*Braden, Spruille	Asst. Sec'y
	Russell, Donald S.	Asst. Sec'y
Department of the Treasury	*Snyder, John W.	Secretary
	Wiggins, A. L. N.	Under-Sec'y
Bureau of Comptroller of Currency	Delano, Preston	Comptroller
Treasurer of the U.S.	Julian, William A.	Treasurer
Bureau of Customs	Johnson, W. R.	Commissioner
Bureau of Internal Revenue	Nunan, Joseph D., Jr.	Commissioner
Bureau of Narcotics	Anslinger, Harry J.	Commissioner
*Bureau of the Mint	Ross, Mrs. Nellie Tayloe	Director
U.S. Savings Bonds Division	Clark, Vernon L.	Nat'l Director
*U.S. Coast Guard	Farley, Joseph F., Adm.	Commandant
War Department	*Patterson, Robert P.	Secretary
	Royall, K. Claiborne	Under-Sec'y
General Staff	*Eisenhower, Dwight D., Gen. of the Army	Chief of Staff
*Women's Army Corps	Boyce, Westray Battle, Col.	Director
Army Ground Forces	Devers, Jacob L., Gen.	Comm'd'g Gen.
Army Air Forces	*Spaatz, Carl, Gen.	Comm'd'g Gen.
Department of Justice	*Clark, Tom C.	Att'y-Gen.
Solicitor General	Vacancy	Solic. Gen.
*Federal Bureau of Investigation	Hoover, J. Edgar	Director
Bureau of Prisons	Bennett, James V.	Director
Immigration and Naturalization Service	Carusi, Ugo	Commissioner
*Post Office Department	*Hannegan, Robert E.	Postmaster Gen.
Department of the Navy	*Forrestal, James	Secretary
	Sullivan, John L.	Under-Sec'y
Chief of Naval Operations	*Nimitz, Chester W., Fleet Adm.	Chief of Naval Operations
Bureau of Naval Personnel	Denfeld, Louis E., Vice-Adm.	Chief
*Women's Reserve of the U.S. Naval Reserve	Hancock, Joy B., Capt.	Director
Bureau of Ordnance	Hussey, George F., Jr., Vice-Adm.	Chief
Bureau of Ships	Mills, Earle W., Vice-Adm.	Chief
Bureau of Aeronautics	Sallada, H. B., Rear Adm.	Chief
Bureau of Yards and Docks	Manning, J. J., Rear Adm.	Chief
*U.S. Marine Corps Headquarters	Vandegriff, Alexander A., Gen.	Commandant
*Women's Reserve of the U.S. Marine Corps Reserve	Hamblett, Julia, Maj.	Director
Department of the Interior	*Krug, Julius A.	Secretary
	Chapman, Oscar L.	Under-Sec'y
Bureau of Land Management	Johnson, Fred W.	Act'g Director
Office of Indian Affairs	Brophy, William A.	Act'g Director
Solid Fuels Administration for War	*Krug, Julius A.	Administrator
Geological Survey	Wrather, William E.	Director
Fish and Wildlife Service	Day, Albert M.	Director
Bureau of Reclamation	Straus, Michael W.	Commissioner
National Park Service	Drury, Newton B.	Director
Bureau of Mines	Sayers, Royd R.	Director
Division of Territories and Island Possessions	Arnold, Edwin G.	Director
Department of Agriculture	*Anderson, Clinton P.	Secretary
	Dodd, Norris E.	Under-Sec'y
*Agricultural Research Administration	Lambert, W. V.	Administrator
Bureau of Animal Industry	Simms, Bennett T.	Chief
Bureau of Agricultural and Industrial Chemistry	Howard, L. B.	Chief

*See separate article or related articles.

¹Resigned effective Jan. 8, 1947. Gen. George C. Marshall appointed Sec'y of State.

Department or Bureau	Name	Post
Bureau of Dairy Industry	Reed, Ollie E.	Chief
Bureau of Entomology and Plant Quarantine	Annand, P. N.	Chief
Bureau of Plant Industry, Soils, and Agricultural Engineering	Salter, Robert M.	Chief
Bureau of Human Nutrition and Home Economics	Stiebeling, Hazel K.	Chief
Office of Experiment Stations	Taullinger, R. W.	Chief
Bureau of Agricultural Economics	Wells, O. V.	Chief
Extension Service	Wilson, M. L.	Director
*Farm Credit Administration	Duggan, I. W.	Governor
*Farmers Home Administration	Laseter, Dillard B.	Administrator
Forest Service	Watts, Lyle F.	Chief
Office of Foreign Agricultural Relations	Wheeler, L. A.	Director
Production and Marketing Administration	G'mer, Jesse B.	Administrator
Commodity Credit Corporation	Gilmer, Jesse B.	President
Federal Crop Insurance Corporation	Geissler, Gus	Manager
*Rural Electrification Administration	Wickard, Claude R.	Act'g Administrator
*Soil Conservation Service	Bennett, Hugh H.	Act'g Chief
Department of Commerce	*Harriman, W. Averell	Secretary
	Burden, William	Under-Sec'y
	Capt, James C.	Director
*Bureau of the Census	Taylor, Amos E.	Director
Bureau of Foreign and Domestic Commerce	Condon, E. U.	Director
*National Bureau of Standards	Colbert, Leo O.	Director
*Coast and Geodetic Survey	Trimble, South, Jr.	Chairman of the Board
Inland Waterways Corporation	Wright, Theodore P.	Administrator
*Civil Aeronautics Administration	Landis, James M.	Chairman
Civil Aeronautics Board	Ooms, C. W.	Commissioner
*Patent Office	Reichelderfer, F. W.	Chief
*Weather Bureau	*Schwellenbach, Lewis B.	Secretary
Department of Labor	Johnson, Kevin	Under-Sec'y
	Warren, Edgar L.	Director
U. S. Conciliation Service	Clague, Ewan	Acting Commissioner
Bureau of Labor Statistics	Wirtz, W. Willard	Chairman
*National Wage Stabilization Board	Goodwin, Robert C.	Director
U. S. Employment Service	Erskine, Graves B., Maj. Gen.	Acting
Retraining and Re-employment Administration	Lenroot, Katharine F.	Administrator
*Children's Bureau	Miller, Frieda S.	Chief
Women's Bureau	Beyer, Mrs. Clara M.	Chief
Division of Labor Standards	Walling, L. Metcalfe	Act'g Director
Wage and Hour and Public Contracts Divisions	Henderson, Charles B.	Administrator
Federal Loan Agency	Henderson, Charles B.	Act'g Administrator
*Reconstruction Finance Corporation	Schieck, DeWitt C.	Chairman
U.S. Commercial Company	Grant, Alan L.	President
Rubber Development Corporation		President
Federal National Mortgage Association	Allen, George E.	President
RFC Mortgage Company	Allen, George E.	President
War Damage Corporation	Allen, George E.	President
*Federal Security Agency	Miller, Watson B.	Administrator
Office of Education	Studebaker, John W.	Commissioner
Public Health Service	Parran, Dr. Thomas	Surgeon General
*Social Security Administration	Altmeyer, Arthur J.	Commissioner
Food and Drug Administration	Dunbar, Paul B.	Commissioner
*Office of Vocational Rehabilitation	Shortley, Michael J.	Director
Bureau of Employees' Compensation	McCauley, William	Director
*Federal Works Agency	Fleming, Philip B., Maj. Gen.	Administrator
Public Buildings Administration	Reynolds, W. E.	Commissioner
Public Roads Administration	MacDonald, Thomas H.	Commissioner
Bureau of Community Facilities	Field, George H.	Commissioner
Independent Offices		
*Export-Import Bank of Washington	Martin, William McC.	President
*Federal Communications Commission	Denny, Charles R., Jr.	Chairman
*Federal Deposit Insurance Commission	Harl, Maple T.	Chairman
*Federal Reserve System, Board of Governors of the	Smith, Nelson Lee	Chairman
*Federal Trade Commission	Eccles, Marriner S.	Chairman
*General Accounting Office	Ferguson, Garland S.	Chairman
*Government Printing Office	Warren, Lindsay C.	Comptroller General
*Interstate Commerce Commission	Giegack, A. E.	Chairman
Library of Congress	Aitchison, Clyde B.	Chairman
National Advisory Committee for Aeronautics	Hunsaker, Dr. Jerome C.	Chairman
*National Archives	Buck, Solon J.	Archivist
National Capital Park and Planning Commission	Grant, U.S. III, Maj. Gen.	Chairman
*National Labor Relations Board	Herzog, Paul M.	Chairman
*National Mediation Board	Douglass, Frank P.	Chairman
Railroad Retirement Board	Kennedy, William J.	Chairman
*Securities and Exchange Commission	Caffrey, James J.	Chairman
*Smithsonian Institution	Welfare, Alexander	Secretary
Tax Court of the United States	Turner, Balon B.	Presiding Judge
Tennessee Valley Authority	Clapp, Gordon R.	Chairman
U.S. Atomic Energy Commission	*Lilienthal, David E.	Chairman
U.S. Civil Service Commission	Mitchell, Harry B.	President
U.S. Maritime Commission	Smith, William W., Vice-Adm.	Chairman
U.S. Tariff Commission	Ryder, Oscar B.	Chairman
*Veterans' Administration	*Bradley, Omar N., Gen.	Administrator
Executive Office of the President		
Bureau of the Budget	Webb, James E.	Director
Council of Economic Advisers	Nourse, Edwin G.	Chairman
Office of Government Reports	Blackburn, Katherine C.	Act'g Director
Emergency War Agencies		
Office for Emergency Management (in Executive Office of the President)	Johnson, J. M.	Director
*Office of Defense Transportation		
Office of Scientific Research and Development	Bush, Dr. Vannevar	Director
Office of Temporary Controls	Fleming, Philip B., Maj. Gen.	Administrator
Philippine Alien Property Administration	Henderson, James McL.	Administrator

*See separate article.

Department or Bureau	Name	Post
War Assets Administration	Littlejohn, Robert M.	Administrator
*National Housing Agency	Foley, Raymond M.	Administrator
*Federal Home Loan Bank Administration	Fahey, John H.	Commissioner
*Home Owners' Loan Corporation	Cotter, Charles F.	Gen. Manager
*Federal Housing Administration	Foley, Raymond M.	Commissioner
*Federal Public Housing Authority	Myer, Dillon S.	Commissioner
Office of Housing Expediter	Creedon, Frank R.	Housing Expediter
*Board of War Communications	Denny, Charles R., Jr.	Chairman
Philippine War Damage Commission	Waring, Frank A.	Chairman
*Selective Service System	Hershey, Lewis B., Maj. Gen.	Director
*United Nations Relief and Rehabilitation Administration	Rooks, Lowell W., Maj. Gen.	Director General
Quasi-Official Agencies		
*American National Red Cross	O'Connor, Basil	Chairman, Central Committee
*Pan American Union	Vacancy	Director General
*National Academy of Sciences and National Research Council	Jewett, Frank Baldwin Bronk, Detlev W.	President, National Academy of Sciences Chairman, National Research Council

Great Britain.—The following were his majesty's chief officers of state and the permanent officials of the more important of the government departments of Great Britain at the close of 1946:

Ministry or Department	Name	Post
Admiralty	Viscount Hall J. G. Lang	First Lord Act'g Permanent Sec'y
Agriculture and Fisheries, Ministry of	Thomas Williams Sir Donald Vandepuer	Minister Permanent Secretary
Air Ministry	*Philip Noel-Baker Sir William Brown	Secretary of State Permanent Under-Sec'y
Assistance Board	Baron Soulbury H. Fieldhouse	Chairman Acting Secretary
*Bank of England	Baron Catto W. H. Nevill	Governor Secretary
Burma Office	*Baron Pethick-Lawrence Sir David T. Monteath	Secretary of State Perm't Under-Sec'y
Cabinet Office	Sir Norman Brook	Sec'y of the Cabinet
Cairo, British Middle East Office	Sir Arnold Overton	Head of Office
Civil Aviation, Ministry of	Baron Nathan Sir Henry Self	Minister Permanent Secretary
Colonial Office	Arthur Creech Jones Sir George Gater J. A. Calder } H. F. Downie }	Secretary of State Perm't Under-Sec'y Crown agents
Control Office for Germany and Austria	John B. Hynd	Chancellor of the Duchy of Lancaster
Customs and Excise, Board of	Sir Gilmour Jenkins	Permanent Secretary
Defense, Minister of	Sir Archibald Carter	Chairman
Dominions Office	*Albert V. Alexander Viscount Addison	Minister Secretary of State
Duchy of Lancaster	Sir Eric Machtig	Perm't Under-Sec'y
Education, Ministry of	John B. Hynd Ellen Wilkinson Sir John Maud	Chancellor Minister Permanent Secretary
Electricity Commission	Sir Cyril W. Hurcomb A. E. Marson	Chairman Secretary
Food, Ministry of	John Strachey Sir Percivale Liesching	Minister Secretary
Foreign Office	*Ernest Bevin Hector McNeill Sir Orme Sargent	Secretary of State Minister of State Perm't Under-Sec'y
Fuel and Power, Ministry of	Emanuel Shinwell Sir Donald Fergusson	Minister Permanent Secretary
Health, Ministry of	Aneurin Bevan Sir William S. Douglas	Minister Secretary
Home Office	J. Chuter Ede Sir Alexander Maxwell	Secretary of State Perm't Under-Sec'y
India Office	*Baron Pethick-Lawrence Sir David Monteath	Secretary of State Perm't Under-Sec'y
Information, Central Office of	R. Fraser	Director General
Inland Revenue, Board of	Sir Cornelius Gregg	Chairman
Labour and National Service, Ministry of	George A. Isaacs Sir Godfrey Ince	Minister Secretary
Law Officers' Department	Sir Hartley Shawcross Sir Frank Soskice	Attorney-General Solicitor-General
Lord Chancellor's Office	Baron William Jowitt Sir Albert Napier	Lord Chancellor Perm't Sec'y and Clerk of the Crown
Lord Privy Seal	Arthur Greenwood	Minister
National Insurance, Ministry of	James Griffiths Sir Thomas Phillips	Permanent Secretary Paymaster General
Paymaster General's Office	Arthur Greenwood	Minister
Pensions, Ministry of	Wilfred Paling Sir Harold Parker	Permanent Secretary Postmaster General
*Post Office	Earl of Listowel Sir Raymond Birchall	Director General Lord President
Privy Council Office	*Herbert Morrison Sir Eric C. E. Leadbitter	Clerk of the Council Secretary of State
Scottish Office	Joseph Westwood David Milne	Perm't Under-Sec'y Controller
Stationery Office, H.M.	Sir Norman Scorgie	Minister
Supply, Minister of	John Wilmot Sir Archibald Rowlands	Minister Permanent Secretary

*See separate article.

Ministry or Department	Name	Post
Town and Country Planning, Ministry of	Lewis Silkin Sir Thomas Sheepshanks	Minister Permanent Secretary
Trade, Board of	*Sir Stafford Cripps H. A. Marquand	President Sec'y for Overseas Trade
Transport, Ministry of	Sir J. H. E. Woods Sir Cyril Hurcomb	Permanent Secretary Minister Secretary
Treasury	*Clement Attlee	Prime Minister, First Lord of the Treasury
		Chancellor of the Exchequer
	*Hugh Dalton	Permanent Secretary
War Damage Commission	Sir Edward Bridges	Chairman
War Works Commission	Sir M. Trustram Eve	Chairman
War Office	F. J. Bellenger Sir Eric Speed	Secretary of State Perm't Under-Sec'y
Works, Ministry of	George Tomlinson H. C. Emmerson	Minister Permanent Secretary

Government Expenditures and Government Receipts: see BUDGET, NATIONAL.

Government Printing Office: see PRINTING OFFICE, U.S. GOVERNMENT.

Governors and Premiers, British: see BRITISH EMPIRE.

Grain: see BARLEY; CORN; OATS; RICE; RYE; WHEAT.

Granite: see STONE.

Granville-Barker, Harley Granville (1877-1946), British dramatist, was born on Nov. 25 in London. Noted for his scholarship as well as for his dramatic works, he was a leading exponent for a national British theatre, and he considered that the national theatre should be on the same level with the National gallery and the British museum. As actor, producer and theatrical manager, he was influential in introducing to British audiences numerous plays of literary merit which because of their limited appeal would have been risky commercial ventures. He was a visiting professor at Yale and Harvard from 1940 to 1943, a Fellow of the Royal Society of Literature and a member of its Academic committee. Among his later works are, *The Secret Life* (1926), *Prefaces to Shakespeare*, Series 1 (1927), Series 2 (1929) and Series 3 (1936); *On Dramatic Method* (1931) and *The Study of Drama* (1934). His death was reported in Paris, Aug. 31. (See *Encyclopædia Britannica*.)

Grapefruit: see FRUIT.

Grapes: see FRUIT.

Graphite. Production of graphite in the United States increased from 7,120 short tons in 1942 to 9,939 tons in 1943, but dropped back to 5,408 tons in 1944 and 4,888 tons in 1945. Corresponding shipments were 7,253 tons, 9,597 tons, 5,768 tons and 5,334 tons. Imports declined from a high of 43,921 tons in 1942 to 26,184 tons in 1944, but recovered to 36,286 tons in 1945. Mexico, Madagascar and Ceylon furnish most of the imports.

Canada produced 1,903 short tons in 1943, 1,582 tons in 1944, and 1,840 tons in 1945, mainly of foundry grades. (G. A. Ro.)

Gravel: see SAND AND GRAVEL.

Great Britain & Northern Ireland, United Kingdom of. This comprises the main island of smaller islands off the English and Scottish coasts, and the six northeastern counties of Ireland. It is a constitutional monarchy, with a king and a parliament of houses, the house of lords consisting of about 670 hereditary peers, 24 spiritual peers, 16 Scottish representative peers, a number of Irish repre-

sentative peers (in 1946, 8; vacancies are no longer filled) and a few life peers who have held high judicial office; and the house of commons, numbering 640 members, elected by universal suffrage. Flag, the Union Jack, consisting of a red cross on a white field (for England), surcharged on a diagonal red cross on a white field (for Ireland), surcharged in turn on a diagonal white cross on a blue field (for Scotland). Ruler: King George VI (*q.v.*); prime minister: Clement R. Attlee (*q.v.*). Established church: Protestant Episcopal in England, Presbyterian in Scotland. Area: 93,667 sq.mi. (England, including Monmouthshire, 50,870); pop. (est. June 30, 1946, members of the armed forces excluded): 47,175,000 (England 38,866,000). Capital: London (pop. est. June 30, 1938): city and metropolitan police districts, 8,655,000; city and metropolitan boroughs only, 4,062,800. Chief towns: Glasgow (June 30, 1938) 1,131,500; Birmingham (1945 est.) 1,001,600; Liverpool (1939 est.) 864,000; Manchester (1945 est.) 624,300; Sheffield (1938 est.) 520,000; Leeds (1938 est.) 494,000; Edinburgh (June 30, 1946) 463,100; Belfast (Jan. 1, 1939) 443,500; Bristol (1938 est.) 415,000; Hull (1938 est.) 318,700.

History.—The first year of peace was for the British people a year of continuous demobilization of the armed forces; of difficult but altogether successful reconversion of industry from war to peace production; of continued hardship in food rationing, stricter in certain categories than during the war; of an export drive hampered by insufficient coal production; of the nationalization of the Bank of England and the coal mining industry and of some disappointments in the field of foreign policy.

The Budget.—The estimates for 1946-47 showed an anticipated revenue of £3,161,300,000, an expenditure of £3,886,917,000 and a deficit of £725,617,000, nearly £1,500,000,000 less than in 1945-46. These figures do not, however, allow for £100,000,000 to £150,000,000 war damage payments, £150,000,000 to £200,000,000 excess profits tax refunds, £100,000,000 for the civil contingencies fund and £26,000,000 refund of postwar credits to men of 65 and women of 60 years of age and upwards. The payment of family allowances, which would cost £60,000,000 in a full year, began in Aug., and in Oct. old age pensions were raised to 26s. for single persons and 42s. for married couples, involving an annual expenditure of £80,000,000. The chancellor of the exchequer gave income-tax payers relief amounting to £33,000,000 by increasing to one-eighth the earned income allowance on incomes below £1,200, by restoring the personal allowance to the prewar level and by raising the married women's allowance from £80 to £110. He remitted purchase tax on certain household goods at a cost of £15,250,000 but indicated that the purchase tax was likely to remain permanent to contribute towards the cost of social security schemes (national insurance and national health service). In addition he granted reliefs of death duties on estates below £7,500 in value and a total remission on those below £2,000, but accompanied these remissions by an increase on estates from £12,500 upwards. Excess profits tax was discontinued, effective Jan. 1, 1947. The continued high rates of taxation served as one of the preventatives of inflation. So also did the government's control over capital. The Borrowing Control act empowered it to control capital issues and capital export and also enabled the treasury to guarantee loans for reconstruction and development purposes up to £50,000,000 a year. Under the act nationalizing the Bank of England, which received the royal assent in Feb., the government secured statutory power to control also short-term borrowing. The U.S. credit to Britain of \$4,400,000,000 received the president's signature on July 15, seven months after the agreement had been signed. By the end of 1946 \$600,000,000 had been drawn by Britain.

SQUATTERS who had invaded an apartment building in Regents park, London, in Sept. 1946, appealing for supplies. The local council had turned off the water, and the squatters feared they could not return if they left the building

Manpower Position.—Recovery was handicapped by lack of manpower. The available labour force and its distribution at various times are shown below:

Available Force (000s omitted)				
	1939 (June)	1945 (June)	1946 (June)	1946 (October)
Males	14,656	14,881	14,638	14,550
Females	5,094	6,768	5,885	5,806
	19,750	21,649	20,523	20,356

The total of 20,356,000 (Oct. 1946) included all males aged 14 to 64 and all females aged 14 to 59. From Dec. 1945 to Oct. 1946 the female working population decreased by about 500,000, indicating the return of women to domestic duties, but at 5,806,000 was still 712,000 above the figure for June 1939. By the end of Dec. 1946 the total armed forces had been reduced to approximately 1,250,000, which compared with 480,000 in 1938. Military conscription remained in force but after Jan. 1, 1947, no one would be called up before the age of 18 and the service of those called up in the first 13 months was to be limited to 2 years and thereafter scaled down to 18 months as from Dec. 1948. Compulsion was not to be applied to women, but volunteering would be encouraged. Estimates of recruits thus enrolled were 190,000 after allowing for deferments. When the term of service should fall to 18 months the number of conscripts would be 285,000, excluding the deferred. In addition volunteers were expected to total 450-500,000, but the results of the first recruiting campaign were not encouraging. In Oct. a decision to appoint a separate minister of defense, a post hitherto filled by the prime minister, was announced. His duties were stated to be the co-ordination of the three service

departments both as among themselves and in relation to national resources and government policy. A. V. Alexander, until then first lord of the admiralty, became the first holder of the office. Four other priority claims on the labour force were housing, exports, coal and food production.

Housing.—From April 1, 1945, to Nov. 30, 1946, the number of houses, flats, temporary houses, etc., provided was:

New permanent houses	43,098
Temporary houses	80,135
Rebuilding, adaptation and repair of existing premises	141,592
Temporary huts	3,480
	<hr/> 268,305

Causes of the relatively slow progress in the housing program other than shortage of labour were insufficient supplies of building materials and components. Occupation of disused military camps by "squatters" was a symptom of the pressure on housing. The government intended to use some of the camps for temporary accommodation, but adaptations for that purpose were necessary. Before these were made 1,178 camps were invaded by 46,335 persons. A more serious development was a well-organized occupation of privately-owned flats, but they were evacuated in obedience to a court order. Other causes of shortage of accommodation were scarcities of furniture and household equipment.

Exports.—The figures for imports and exports for 1946, 1945 and 1938 were as follows:

	Imports	Exports (in million £)	Re-exports
1938	919.5	470.8	61.5
1945	1,103.7	399.3	51.0
1946	1,297.7	911.7	50.3

The export target set for 1946 of £750,000,000 was thus exceeded by a considerable margin, but the ultimate target aimed at of a volume of exports 75% above that of 1938 (representing some £1,500,000,000 at 1946 prices) remained far distant. While exports of machinery, vehicles and chemicals showed satisfactory increases in volume (*i.e.*, after eliminating the rise in the price level), exports of cotton and particularly coal were still far below the prewar level.

Coal.—In 1946 coal production showed an increase over 1945 and the total figure for the year was expected to be in the neighbourhood of 212,800,000 short tons, some 7,000,000 short tons above the 1945 total. This higher production was secured by a labour force lower in numbers, on the average, than the 1945 strength, but younger in age composition owing to the demobilization of miners after the end of the war. The following table summarizes the position statistically:

	Weekly Averages			
	1945	July 1946	Sept. 1946	Nov. 1946
Mined coal (000 short tons)	3,745	3,801	4,005	4,183
Opencast coal (short tons)	175	215	205	180
Wage earners effectively employed (numbers)	709	699	697	692
Absenteeism (%)	16.31	14.54	16.39	14.82
Output at coal face (in short tons per manshift)	3.02	3.08	3.09	3.16
Over-all output (do.)	1.12	1.14	1.15	1.19

The increase in production was absorbed by a parallel increase in inland consumption from 200,000,000 short tons in 1945 to an estimated 206,750,000 in 1946, which reflected the high degree of employment. In the winter months of 1946 the supply position showed signs of great stringency despite the reduction of coal exports and supplies to foreign bunkers from 52,000,000 short tons in 1938 to an estimated 9,800,000 short tons in 1946.

The bill nationalizing the mines received the royal assent on July 12 after various amendments carried by the house of lords had been agreed to by the house of commons. Property of the mines became vested in the state with effect from Jan. 1, 1947. Compensation to the former owners had been fixed by arbitra-

tion at £164,660,000, a sum representing the value of the transferred assets other than ancillary assets (coke ovens, etc.)

Food Production.—In April the government issued a White Paper explaining that it had hoped to make up for anticipated shortages of fats, meat, dairy products and sugar by larger supplies of cereals, but that droughts, war destruction, lack of transport and of fertilizers had interfered. In Europe the harvest of 1945 had been 47%, in India 25%, in South Africa 40% and in French North Africa 70% below normal. The consumption of meat in the U.K. was 100 lb. per head as against the prewar 134 lb. World exports of fats were little more than half those of 1938. The production of European sugar was down by 50%. In these circumstances rationing had not only to be continued but also to be extended. In April Sir Ben Smith, minister of food, resigned and was succeeded by John Strachey, one of whose first duties was to announce bread rationing, which came into operation on July 21. Bread had not been rationed throughout the war years.

The 1946 harvest in Britain proved the latest and the poorest in quality for 30 years. Nor could it have been gathered in, such as it was, but for German prisoners of war who supplied a quarter of the labour force. Large-scale repatriation of German prisoners of war began at the end of Sept. at the rate of 15,000 men per month. Labour shortage in agriculture in 1947 therefore promised to be even greater than in the mines.

Foreign Affairs.—In foreign policy the central issues were the treatment of Germany and relations with the U.S.S.R. and the countries of the Slav "bloc." Closely connected with the soviet issue were the problems of the peace treaty with Italy, the control of the Dardanelles and the division of influences in Iran. In the middle east, Palestine and the future of Anglo-Egyptian relations dominated the political scene.

In Germany the division of the country into four zones of occupation produced different policies in each zone. Contrary to the decision of the Tripartite conference of Berlin of Aug. 2, 1945, Germany was not being treated as an economic unit, with the result that the British zone, deficient in foodstuffs, cost the British taxpayer a figure substantially in excess of the £80,554,000 provided for in the 1946-47 budget. On Dec. 2 the foreign secretary signed an agreement with the United States for the economic fusion of the British and U.S. zones, intended to bring about a self-sustaining economy by 1949 and meanwhile to reduce British and U.S. expenditure on their respective zones by about half. Relations with the U.S.S.R. and the Slav states of eastern Europe lacked cordiality throughout most of the year, although a better atmosphere prevailed after the successful conclusion, in Dec., of the council of foreign ministers in New York. This meeting produced compromise agreements on many issues which had been the source of constant conflict between east and west. While the U.S.S.R. did not maintain Yugoslavia's claims to the possession of Trieste, the western powers, Britain among them, consented to the early evacuation of the Trieste territory. Similarly, the U.S.S.R. gave way to British, French and U.S. claims for free navigation on the Danube, but secured in exchange recognition of the principle that the riparian states would have the decisive voice in the new regime of the river.

The test of strength between the U.S.S.R. and the western powers extended to neighbouring Turkey (*q.v.*). Britain, in line with the United States and other signatories of the Montreux convention of 1936 on the regime of the straits, opposed the demands of the U.S.S.R. to secure from Turkey a share in the direct control of this exit to the Mediterranean. At the end of 1946 each side maintained its position and the problem seemed nowhere near a solution. A similar test of strength proceeded in Iran (*q.v.*) where British policy—standing for the full inde-

pendence and territorial integrity of Iran—opposed Russian penetration into the northern province of Azerbaijan which took the form of a movement for autonomy led by the Russian-sponsored Tudeh party. At the end of the year this movement failed and for the time being the aim of British policy seemed to have been realized.

In the middle east the position at the end of the year was one of considerable confusion. The Anglo-American Committee of Inquiry on Palestine (*q.v.*) had in April produced a unanimous report of which the outstanding feature was the recommendation to permit the immediate immigration of 100,000 Jews from Europe. This recommendation was not accepted by the British government. Instead, it proposed a plan for the partition of Palestine recommended by the Anglo-U.S. experts. This plan was rejected by both Arabs and Jews. A round-table conference opened in London in Sept. in which both the Jews and the Arabs of Palestine refused to participate. At the end of the year the position was one of complete deadlock in negotiations, coupled with a renewal of armed coups by groups of Jewish terrorists determined to resist partition and to make of Palestine a Jewish state. While British policy had not yet adopted a new line, the old line of postponing a decision on the Palestinian issue had not proved successful.

Similarly, negotiations with Egypt (*q.v.*) about the renewal of the treaty of alliance of 1936 had reached a deadlock, one of the stumbling blocks being the Egyptian claim to assume full sovereignty over the Sudan, heretofore an Anglo-Egyptian con-

dominium. The extent of joint defense arrangements for the Suez canal was another difficulty. Under the 1936 treaty Britain kept military and naval forces in Egypt for the defense of the canal. These had been voluntarily evacuated in the course of 1946 to the canal zone proper to create a favourable atmosphere for the treaty negotiations.

The still more difficult problem of meeting the demand for complete self-government in India (*q.v.*) was brought nearer to a solution by the mission of three cabinet ministers who succeeded in producing the framework of a united India constitution acceptable to the Moslem league and the Hindu Congress party.

The mission was, however, unable to arrange for a combined interim government until a constituent assembly met to draw up the constitution and this had to be formed afterward by the Congress party alone. At the end of 1946 the situation therefore remained uncertain. (H. A. Wm.)

Education.—In 1937-38: elementary, England and Wales—departments under separate head teachers, 29,988, scholars on register 5,150,874; elementary, Scotland—schools 2,895, scholars 617,047; elementary, Northern Ireland—schools 1,700, scholars 191,862; secondary, England and Wales—grant-aided schools 1,398, scholars 470,003; secondary, Scotland—grant-aided schools 252, scholars 156,645; secondary, Northern Ireland—grant-aided schools 75, scholars 14,557; universities (1945), students: England 37,443; Wales 2,750; Scotland 10,571; Northern Ireland 2,663.

Banking and Finance.—Revenue, ordinary (est. 1946-47) £3,161,300,000. Expenditure, ordinary (est. 1946-47) £3,886,917,000. Revenue, ordinary (actual, 1945-46) £3,284,450,000. Expenditure, ordinary (actual, 1945-46) £5,484,533,000. Notes in circulation (average June 1946): £1,360,500,000; (Dec. 1946) £1,404,760,000.

Public debt (internal and external, Dec. 31, 1946): £24,785,000,000. Exchange rate (1946): £1=\$4.034.

Trade and Communication.—Roads (March 31, 1938) England and Wales (class I) 20,627 mi.; (class II) 13,070 mi.; Scotland (class I) 6,632 mi.; (class II) 3,967 mi.; Northern Ireland (class I) 1,273 mi.; (class II) 1,933 mi. Railways (Dec. 31, 1938): Great Britain, track open to traffic, excluding sidings, 20,007 mi.; Northern Ireland, standard gauge, 633 mi.; narrow gauge, 121 mi. Freight (1945) 294,694,000 short tons. Passenger journeys (1945) 1,312,800,000. Airways (March 31, 1945-March 31, 1946): aircraft mi. flown 25,738,834 mi.; passengers carried 143,950; passenger mi. flown, 295,839,835; net route mileage 66,716; ton mi. capacity 67,374,802; cargo and excess baggage 5,637 short tons; mail 3,166 short tons. Shipping: excluding vessels under 5,000 gross tons and foreign vessels on bareboat charter or requisition (Sept. 30, 1946) 13,626,000 gross tons. Under construction (vessels more than 100 gross tons, excluding non-propelled craft, Sept. 30, 1946) 1,709,000 gross tons. Shipping: (net tonnage with cargo) entered (monthly average Oct. 1945-Sept. 1946) 2,622,000; cleared (monthly average Oct. 1945-Sept. 1946) 1,640,000. Motor vehicles licensed (Aug. 31, 1946): cars 1,746,800; hackney vehicles (buses, coaches, taxis, etc.) 194,673; commercial and miscellaneous vehicles 740,479; motor cycles 438,945; total 3,030,897. Wireless receiving set licences (Sept. 1946): 10,673,000; telephones (March 1945): exchanges 5,574; call offices 52,169; telephones 3,888,626.

Great Lakes Traffic: see CANALS AND INLAND WATERWAYS.

Greece. A kingdom in the southern part of the Balkan peninsula. Area: 50,147 sq.mi., of which 41,328 are mainland. Pop. (census May 16, 1928), 6,204,684, (est. 1940) 7,150,000. Capital: Athens (392,781). Chief cities: Thessaloniki or Salonika (236,524), Patras (61,278), Cavalla (49,980), Candia (33,404), Corfu (32,221). Religion: mostly Greek Orthodox; inconsiderable Mohammedan and Jewish minorities. King: George II. Prime minister (1946): Constantin Tsaldaris.

History.—During 1946 Greece suffered from the economic disintegration caused by World War II and from the accumulated bitter grievances of decades of civil feuds which made the much-needed internal reconciliation difficult. In the economic field the U.S. Export-Import bank granted Greece in Jan. 1946 a loan of \$25,000,000 with which to purchase supplies and equipment. The state department advised the Greek authorities to take rigorous measures to control inflation, to increase the efficiency of the civil service and to revive industry and trade. It supported the project of sending a British advisory economic mission to Greece. Great Britain gave Greece a stabilization loan of \$40,000,000 and direct economic assistance in the form of railway rolling stock, vehicles, textiles and other nonfood items. The United Nations Food and Agricultural organization prepared a sweeping 25-year plan for Greece in Sept. 1946. In Dec. 1946 President Harry S. Truman appointed Paul A. Porter, the former chief of the OPA, as head of a U.S. economic mission to Greece to examine economic conditions as related to the reconstruction and development of that country's economy. A second \$25,000,000 U.S. credit was extended to Greece for purchase of surplus property.

In the domestic situation, a clarification was brought about by the general elections held on March 31. To ensure the fairness and freedom of the elections, the Great Powers were invited to send observers. The U.S., Great Britain and France accepted while the U.S.S.R. refused. The U.S. delegation was headed by Henry F. Grady and included Maj. Gen. Harry J. Malony, Walter H. Mallory, Joseph C. Green, James G. Rogers, William W. Waymack and Herman B. Wells. Under them about 600 U.S. soldiers served in teams as election watchers throughout Greece.

The elections were held in spite of a boycott from the leftist parties. The Allied mission representing the United States,

KING GEORGE II reviewing troops upon his return to Greece, following the plebiscite of Sept. 1, 1946, which restored him to the throne

Great Britain and France, found the results to represent "a true and valid verdict of the Greek people." According to the mission the abstention of the leftist parties did not materially affect the outcome of the elections. Freedom of the press was found to characterize the election period. The report recognized "the present intensity of political emotions in Greece" but thought the elections capable of standing comparison as to decorum with general elections in democratic countries.

In the elections the Populist party (royalist) came out as the strongest. The National bloc under the leadership of George Papandreou, Sophocles Venizelos and Panayotis Kanellopoulos came second with the Liberals third. The first two parties are republicans. The Populist leader Constantin Tsaldaris formed on April 17 a new cabinet consisting mainly of royalists. Against the advice of the British government which favoured a broad coalition of reconciliation and the postponement of the plebiscite about the king's return until 1948, the government fixed Sept. 1, 1946, as the date for the plebiscite.

To ensure the regularity of the electoral lists for the plebiscite, the Greek government invited representatives from the democratic nations to assist with the revision of the electoral lists. The U.S. sent a mission of about 50 experts under Leland Morris to check the validity of the revised lists. After having observed for six weeks the compilation of the lists, the Allied mission issued a report on Aug. 19 expressing itself "satisfied that the revision and recompilation of the lists attained a degree of fairness and accuracy which justifies their use in seeking the opinion of the Greek people on matters of national import." The British mission was headed by Richard Windle, national agent of the British Labour party. The opponents of the plebiscite maintained that the anarchy and civil strife prevailing throughout the country worked against holding the plebiscite. Nevertheless, the plebiscite was held. Of 1,801,140 registered voters 1,691,592 voted. Of these 1,166,512 voted for the monarchy, 521,267 were against it, 3,813 votes were invalid. On Sept. 27 King George II returned to Greece and assumed his duties. The regency by Archbishop Damaskinos which was instituted in Dec. 1944 came to an end. The efforts to broaden the government failed. Tsaldaris reconstructed his cabinet with only very few changes, in spite of the fact that the ambassadors of Britain and of the U.S. urgently requested a broadening of the government, a measure which they regarded as a prerequisite for ending the civil strife in Greece.

This civil strife was especially acute in the northern part of Greece where the country borders on the two Communist-controlled Slav countries, Yugoslavia and Bulgaria. Though Bulgaria was on Germany's side during World War II and though its troops occupied Greek territory with German help in 1941, Bulgaria demanded western Thrace from Greece and the U.S.S.R. supported this Bulgarian demand for part of the Aegean coast. This territorial acquisition by Bulgaria would separate Turkey from Greece and at the same time allow Bulgarian, and, at least indirectly, soviet control of the Aegean approaches to Constantinople and the Straits. Yugoslavia raised demands upon Greek Macedonia with the great Aegean port of Salonika. Some of the strife was undoubtedly of local origin, expressing republican opposition to the regime; some of it was supposed to be supported by Yugoslavia and Bulgaria for reasons of territorial expansion at the cost of Greece; some of it was probably of mixed origin, Communists of Greek descent spurred on by the aspirations emanating from outside Communist centres. Greece itself put forward territorial claims for northern Epirus from Albania with the high plateau of Koritza, and for a frontier rectification from Bulgaria which would give Greece an acceptable defensive strategic position to avert a repetition of the disaster of 1941, in which Greece was attacked from Bulgaria and the Bulgarians sided with German aggression.

The nature of these claims and counterclaims and the frontier unrest produced by them drew repeatedly international attention upon this Greco-Slav struggle. At the meeting of the Security council of the United Nations early in 1946 the U.S.S.R. charged that the presence of British troops in Greece was a threat to peace and demanded their immediate and unconditional withdrawal. The Greek delegation asked that the troops remain. The British foreign secretary, hinting at the danger of a Communist-sponsored civil war in Greece, requested a direct vote of the Security council whether the British government, acting in response to the demand of the Greek government in lending some of its forces to help get order and economic reconstruction in that country, was endangering peace. When it became clear that the overwhelming majority of the Security council favoured the British stand, the soviet delegate invoked the veto power to prevent such a declaration.

With the unrest spreading along its northern frontiers, the Greek government demanded in Dec. 1946 an investigation by the United Nations. On Dec. 19 the Security council voted unanimously to send an investigating commission to the Balkans to begin its work by Jan. 15. The commission was to consist of representatives of each of the 11 nations forming the Security council and to have the right to travel anywhere in Greece, Bulgaria, Yugoslavia and Albania. The soviet government which had vetoed a similar plan on Sept. 20 agreed this time to it, though it maintained, as did Yugoslavia, Bulgaria and Albania, that the real cause of the trouble was the "reactionary" government of Greece.

(H. Ko.)

Green, William (1873-), U.S. labour leader, was born March 3, in Coshocton, O. He spent much of his youth as a miner, and at the age of 27 was a subdistrict president of the United Mine Workers of America. He was elected president of the American Federation of Labor, 1924. Under Green's administration, the A.F. of L. remained predominantly a crafts union. When the Committee for Industrial Organization (later known as the Congress of Industrial Organizations), a group of ten unions affiliated with the A.F. of L.,

opened its campaign to establish industrial unions, Green refused to sanction the operation. This led the C.I.O., then under the guidance of John L. Lewis, to break away from the parent body in 1937. In Jan. 1942, Green and Philip Murray (who succeeded Lewis as head of the C.I.O.) accepted President Roosevelt's proposal that both unions agree to a labour peace for the duration of World War II.

In 1946 Green assailed the Case strike-control measure as "monstrous" (Feb. 28), called for extension of price controls (March 26) and frequently denounced communism. At the A.F. of L. convention in Oct. 1946, in Chicago, where he was re-elected to the presidency of the union, Green demanded lifting of government control over wages. He supported Lewis's stand on both coal strikes and, commenting on the government's decision to press contempt charges against Lewis, warned (Nov. 20): "neither troops . . . nor court injunctions, nor incarceration of miners . . . can serve to produce one single ton of coal."

Greenland. The world's largest island (839,782 sq.mi., some 705,000 sq.mi. covered by glacier), in the North Atlantic ocean, N.W. of Iceland. A Danish possession, it came under temporary United States protection in 1941. Capital, Godthaab. A population of 18,431 (1938) is scattered in small settlements on the west coast, and about 1,000 on the east coast; 391 in all are listed as Europeans (largely Danes) and the rest are native Greenlanders. Seats of the governors are Godthaab in the south and Godhavn in the north.

History.—Throughout World War II the administration of Greenland remained in Danish hands, although the United States exercised special privileges and responsibilities in accordance with the agreement of April 9, 1941, between the Danish minister in Washington, Henrik de Kauffmann, and

ESKIMO YOUNGSTERS posing for a navy photographer at their home in the frozen wastes of northern Greenland in 1946

the United States secretary of state, Cordell Hull. The United States set up bases for aeroplanes and established meteorological stations where weather conditions were studied and vital forecasts made of weather probabilities in the North Atlantic area. The Germans attempted to maintain such stations also, and there were several clashes before the Germans were finally chased out. The agreement of 1941 was ratified by the Danish Rigsdag in May 1945, and in Oct. 1945 the United States announced that it was returning to Denmark four of the army air force weather stations. In Dec. 1946 it was reported that discussions had taken place in Washington between the Danish foreign minister, Gustav Rasmussen, and U.S. officials, which might lead to Danish renunciation of the five-year-old agreement, and removal of the remaining United States troops.

In the summer of 1946 a small fleet of United States navy and coast guard vessels penetrated the Arctic ice floes into the far northern port of Thule, on Smith sound above Baffin bay—only 950 mi. from the north pole. It was a training and weather research expedition, composed of ice-breakers and a seaplane tender, and was commanded by Captain Richard H. Cruzen, who had been second in command with Byrd in the Antarctic 1939–41. A submarine from the Greenland expedition proceeded northward, hunting for underwater channels below ice as much as 60 ft. thick; the route was through the strait between the northern tip of Greenland and Ellesmere Land.

Trade and Finance.—In 1939 Greenland exported 62,231 short tons of cryolite, an ore of great importance in the manufacture of aluminum, and which had not been obtained in quantity anywhere outside Greenland. Other exports, largely fish and fish products, totalled 1,847,000 kroner (1 krone=19.308 U.S. cents in 1940). Imports in 1939 totalled 4,149,000 kr., and consisted chiefly of foodstuffs (607,000 kr.), wood (468,000 kr.), manufactures (451,000 kr.), fruits and other colonial wares (389,000 kr.), meat (253,000 kr.). The government budget for 1939–40 was balanced at 6,035,000 kr. (F. D. S.)

Greiser, Arthur (1897–1946), German politician, was a lieutenant in the German army in World War I. A native of Sroda, Poland, he entered business after the war's end, and became a member of the Danzig German-Social party in 1925. During Hitler's rise to power, Greiser joined the nazi party in Danzig. He was vice-president of the Danzig senate and senator for home affairs in the Free City, 1933, and president of the senate and senator for foreign affairs the following year (1934). From 1936 to 1939, he was senator for social affairs. Greiser, allegedly a "moderate" before the German conquest of Poland, was made *gauleiter* of Poznan after the occupation. He was accused of tyrannical rule of Poznan and of having sent thousands to death camps. After the war, Greiser was tried in a Polish court on charges of having committed war crimes. Throughout his hearing, he protested his innocence, asserting that he had been forced to obey the orders of Hitler and Himmler. If spared, he pleaded, he would serve Prime Minister Stalin faithfully the rest of his life. However, a Polish court found Greiser guilty and while a crowd of 15,000 looked on, he was hanged from a scaffold in a Poznan square, on July 21.

Gromyko, Andrei A. (1909–), soviet diplomat, was born July 5 in the village of Stayre Gromyki in the Gomel region of the U.S.S.R. He graduated from the Minsk Institute of Agricultural Economics in 1934, and in 1939 he became counsellor in the U.S.S.R. embassy in

Washington. Gromyko succeeded Maxim Litvinov in Aug. 1943 as soviet ambassador to the United States and also to Cuba. He headed the U.S.S.R. delegation at the Dumbarton Oaks conference in 1944, attended the San Francisco conference in 1945 and was named chief soviet delegate to the United Nations organization.

Gromyko staged his celebrated walkout from the council sessions in New York March 27, 1946, after rejection of his request for more time to prepare his case on the Iranian debate. He returned to the council sessions April 9; the following day (April 10) it was disclosed that he had been freed of his duties as ambassador to become permanent soviet delegate to the Security council. He was named to the U.N. Atomic Energy commission, May 3, and presented (June 19) the soviet plan for control of atomic energy which provided for an international agreement to outlaw atomic weapons but emphasized the necessity of retaining the veto. Gromyko was also in the forefront of debate on Spain and Greece, both of whose governments he denounced before the council as threats to international peace and security. It was disclosed on Dec. 29 that he had been promoted to deputy minister of foreign affairs.

Guadeloupe: see FRENCH COLONIAL EMPIRE.

Guam. Largest island of the Marianas group in the Pacific. Guam has an area of 225 sq.mi. It is in 13° 26' N. lat. and 144° 39' E. long., and is 3,600 mi. W. of Hawaii, 1,353 mi. S. of Yokohama and 1,506 mi. E. of Manila. Pop. (1946) 23,136, of whom 22,698 were natives. Capital Agaña (10,004).

History.—In Dec. 1941 Guam was captured by the Japanese. It was reoccupied by U.S. forces on July 21, 1944, and later served as headquarters of the Pacific fleet of the U.S. navy and as an important air base for the bombing of Japan. New breakwater and harbour facilities completed at Apra in 1946 made it possible to accommodate 400 ships, and caused it to be described as the future "Pearl Harbor of the western Pacific."

Government.—Naval civil government was restored on May 30, 1946. The president of the United States appoints a naval officer as governor. A popularly elected two-house legislature acts in an advisory capacity. Natives serve as associate justices of the court of appeals and as commissioners of municipalities. Guam has unorganized territorial status and the native Chamorros are nationals of the United States. At the time of the resto-

WRECKED ARMY TRANSPORT PLANES and hangar on Guam after a typhoon had swept the island on Sept. 21, 1946

ration of naval civil government, Rear Adm. Charles A. Pownall, was inaugurated governor of Guam.

Industry and Trade.—Agriculture is the main industry. Fruits and vegetables are produced for home consumption. Copra, chief export before World War II, was still an unimportant item of production in 1946 because of war damage to plantations.

The local wholesale and retail establishments did a total business of \$330,009.29 in July 1946. Only natives are permitted to lease land or to engage in business. A majority of the population was employed by the U.S. navy during 1946.

Finance and Education.—Island revenues before World War II ranged from \$154,797 in 1933 to \$289,587 in 1937. This sum plus approximately \$35,000 appropriated each year by the U.S. congress met the costs of government. Revenues were not expected to produce more than \$100,000 in 1946. As of July 1, 1946, claims for damage resulting from the war totalled \$7,859,770.55.

There were approximately 7,500 children of school age; 7,000 were enrolled in school. All of the 165 teachers were natives. The English language was employed in all schools.

(P. A. V.)

Guatemala. A Central American republic bounded by Mexico, British Honduras, Honduras and El Salvador. Area: 42,364 sq.mi.; pop. (1943 off. est.) 3,450,372, two-thirds of whom are Indian. Capital, Guatemala City (1946 est. pop.), 225,000; other urban centres (1940 census) are Antigua Guatemala (12,601), Chiquimula (10,868), Comalapa (10,461), Mazatenango (14,227), Puerto Barrios (15,784), Quezaltenango (33,538), Zacapa (14,443). Religion: predominantly Roman Catholic. President in 1946: Juan José Arévalo.

History.—The leftist administration of Pres. Arévalo veered slightly toward the centre during 1946 but continued to press its reform program in the face of peaceful conservative resistance. In January the Revolutionary Action party chief, Jorge Toriello, foremost proponent of expropriating foreign businesses, was expelled from the cabinet, and a previous ruling nationalizing the air line Aerovías was declared illegal by congress.

In July, however, congress required that at least 85% of the employees of all companies be nationals, and appointed a committee in September to revise existing contracts in the interests of national sovereignty. In October, rumours of impending expropriation of United Fruit company's vast holdings were spiked by official denial and by the government's impartial handling of a serious labour dispute in the company's banana plantations. An endorsement by Pres. Arévalo of Mexico's 1938 oil expropriations, during a border meeting with the Mexican chief executive, was responsible for the speculation.

Constitutional guarantees remained in force throughout the year, and frequent anti-administration demonstrations were countered by others, participated in by labour and student groups, which endorsed the government's policies and charged the disgruntled clergy with Spanish Falangist connections. The death in exile June 15 of former dictator Jorge Ubico had no effect on the political situation.

The bulk of the administration's social legislation was still pending in congress at the end of the year, but a provisional labour code went into effect in April. The literacy campaign was extended to the jails, and prisoners serving five months or more were required to learn to read and write. The socialized medicine program met vigorous opposition from the nation's doctors.

A ten-day strike in the textile mills at Guatemala City obtained a 40% wage increase. The banana plantation strike of

15,000 workers, which paralyzed the entire northern division of the United Fruit company's operations for 3 weeks, was brought to an end on Oct. 31 by the government, and the workers were obliged to negotiate for a wage adjustment.

The government undertook a vast reforestation program to curtail soil erosion. In April plans were announced for easing both the food shortage and the army's demobilization difficulties by training military personnel in modern farming methods. Private hotel interests formed a corporation capitalized at \$1,000,000 to promote the tourist trade, a growing source of national revenue, and a survey conducted by a United States commission discovered potentially important deposits of petroleum, iron, lead, zinc, copper, mica and crystal quartz in the country.

In foreign affairs, Guatemala reasserted sovereignty over the territory of British Honduras, but agreed with Great Britain to submit the dispute to the judgment of the United Nations' court of international justice. Closer collaboration with neighbouring El Salvador, with a view toward reviving the defunct Central American union, was effected in May by the elimination of passport requirements for each other's nationals and by resolutions to abolish customs duties on their mutual commerce. Nicaragua, Honduras and Costa Rica were invited to participate.

Education.—The government's literacy campaign in 1946 provided 500 adult centres with 10,000 teachers to augment the regular school system, and termination of suffrage rights for illiterates was set for March 1947. In 1943 there were a total of 2,784 schools with a combined enrolment of 152,274 students.

Finance.—The monetary unit is the quetzal, maintained at par with the U.S. dollar. The approved budget for 1946-47 estimated expenditures at 28,125,000 quetzales, ordinary revenues at 26,500,000 quetzales, and the treasury surplus at 1,625,000 quetzales, including U.S. war bonds. The new Bank of Guatemala and a monetary board were inaugurated in July to combat inflation. On Aug. 31, 1946, currency in circulation amounted to 28,315,381 quetzales; coin, 2,646,731 quetzales; and gold reserves, 28,470,792 quetzales.

Trade and Resources.—Exports for 1945 amounted to 30,435,837 quetzales (23,856,753 quetzales in 1944) and imports were valued at 23,348,833 quetzales (20,702,604 quetzales in 1944). During the first eight months of 1946, exports were estimated at 28,000,000 quetzales and imports, 18,700,000 quetzales. The United States took 91% of the exports in 1945 and supplied 67% of the imports. The leading shipments were coffee (984,321 sacks of 60 kg.), bananas (7,852,709 stems), chicle (4,091,162 lb.), mahogany (2,767,000 bd.ft.), ordinary timber, mostly pine (4,158,000 bd.ft.), and hard fibres (2,258 short tons). Banana shipments in 1946 were reduced by strikes and by wind damage to crops causing a loss estimated at 4,481,000 stems. Sugar production for 1946 was estimated at 50,000,000 lb.

Communications.—Railways amounted to approximately 600 mi. of public road and 280 mi. of private. In 1944 highway mileage was est. at 4,045 mi., of which 1,851 mi. was national and 2,194 was departmental. There were 4,228 automobiles registered in 1945. Internal and external air service was expanded during 1946, and government contracts were let for 5,000 new telephones. (See also BRITISH HONDURAS.)

Guerrero, José Gustavo (1876–), Salvador jurist and diplomatist, was born June 26 in San Salvador. Dr. Guerrero, who received a degree of doctor of laws, was educated at San Salvador and Guatemala universities. He entered government service in the early 1900s, was deputy governor of San Salvador, 1900-01, and minister plenipotentiary to Italy, France and Spain, 1912-14. From 1914 to 1923 he was minister plenipotentiary to Italy and Spain. A member of the council of the League of Nations in 1927, he was president of the council two years later (1929). He was also minister plenipotentiary to the Holy See, 1928-30. He attended many international conferences, was vice-president of the Permanent Court of International Justice at The Hague (1931-36) and was president (1937-39). He was elected by the U.N. General assembly and Security council as one of the justices of the new U.N.-sponsored international court of justice, Feb. 6, 1946, and was elected president of the body on April 6. Justice Guerrero assumed his new post, April 18, at The Hague.

Gustavus V (1858–), king of Sweden, of whom a biographical account will be found in the *Encyclopædia Britannica*, ascended the throne in 1907, and long before 1946 had attained the rank of Europe's oldest living monarch.

At the age of 88 King Gustav continued to set an example of vigour for his people. Despite a brief illness in the spring of 1946 and an auto accident on a hunting trip, he was again hunting in November and took occasion to decry golf as an old man's game. He had completed almost 40 years as king in an era of manifold difficulties, and he had been directly instrumental in maintaining the neutrality of Sweden in both World War I and World War II.

The king's grandson, Prince Carl Johan, married a commoner, Mrs. Kerstin Wijkmark, on Feb. 20 in New York; the king removed him from the succession to the throne, and the prince became simply Carl J. Bernadotte. (F. D. S.)

Gymnastics. Frank Cumiskey, 33-year-old postal clerk from Union City, N.J., retained his all-around championship in the A.A.U. gymnastic tournament of 1946. Scoring firsts on the side horse and horizontal bar, Cumiskey scored 300 points out of a possible 330. As a result of Cumiskey's dominance, the Swiss Gymnastic society of Union City dethroned Penn State as team champion. The Swiss society scored 49 points to 41 for Penn State and 21 for the Chicago Sokol. Paul E. Fina of the Chicago Sokol was second in the all-around event with 287.9 points.

Clara Schroth of the Philadelphia Turners repeated as women's champion, but not without a struggle from Helen Schifano of the Elizabeth, N.J., Turners. Miss Schroth scored first in the flying rings, balance beam, parallel bars and free calisthenics to amass 250.1 points to 247 for Miss Schifano. Other women's champions to retain their titles were two 16-year-olds—Margaret Dutcher of Ridgewood, N.J., in clubs and Leonora Owens of Philadelphia in tumbling. (M. P. W.)

Gynaecology and Obstetrics. The most unusual recent finding in either obstetrics or gynaecology was that an attack of rubella (German measles) early in pregnancy will result in congenital deafness or eye defects including blindness, or both, in the infant in more than 50% of all instances. Congenital cardiac disease is another complication. The confirmation of the original announcements on this subject by N. McAllister Gregg and D. G. Carruthers was completed by a large group of additional observers and investigators. If a pregnant woman develops rubella during the first two months of pregnancy, approximately 90% of the infants will have such serious congenital defects that therapeutic abortion is advised.

Streptomycin was not generally available for public use until near the end of 1946. It has high and selective bactericidal effects, is given by intravenous or intramuscular injection, but was shown by Chester S. Keefer to have definite though limited value in the treatment of urinary tract infections during pregnancy or at other times. Intensive treatment for a short period yields the best results. M. Finland and his colleagues cited

cases showing a rapid development of extreme resistance to streptomycin given in inadequate dosage. Others found that such resistance may be dangerously persistent.

H. W. Johnson, in discussing the management of marginal and partial placenta praevia—the afterbirth at the opening of the uterus—in multiparas, made a statement regarding the conservative management of these conditions considered by many as an innovation. He expressed his opposition to the use of bags, version and scalp traction, stating that he had not seen maternal deaths where nature was allowed to take its course as regards labour and delivery. His ultraconservative recommendations were not refuted even by those who strongly advocated Caesarean section for almost all types of placenta praevia.

A routine Rh test of the blood of pregnant women became an established procedure in the better clinics. Once done the record is always available. The husband's blood is studied if that of the pregnant wife is found to be negative. Where an incompatibility was discovered, it was customary to determine by titer at stipulated intervals after the seventh month of pregnancy whether there is an increase in agglutinins as an indication of onset and progress of erythroblastosis in the unborn infant. As the result of such warning, elective Caesarean section may be found advisable at a date shortly prior to term and preparations can and should be made for suitable blood donors to be in readiness for transfusion of the infant as indicated promptly after birth.

A few new facts emerged and were being emphasized:

(1) Infants with erythroblastosis foetalis, although their blood is Rh positive, should be transfused with Rh negative blood because their blood may contain anti-Rh agglutinins.

(2) Even though an erythroblastotic infant's mother is Rh negative, her blood should not be used because it also contains anti-Rh agglutinins.

(3) Group O—Rh negative blood from donors who have not had erythroblastotic infants or who have never been recipients of Rh positive transfusions is used for transfusing these infants.

Sterility studies were an established and substantial part of gynaecologic practice particularly in 1946 in the United States, Canada and Great Britain, as well as many South American countries. Upon a definite routine of careful and complete study of both the husband and the wife, the average rate of pregnancies occurring in previously sterile couples classified as "relative" rather than "absolute" or pathologic sterility, continued to be about 40%. E. Viergiver and W. T. Pommerenke confirmed previous writings on the subject of how the viscosity of cervical mucus varies and the cervical "plug" becomes more permeable midway during the menstrual cycle at which time ovulation presumably occurs.

Investigations were carried on but were still unpublished concerning the effect of hyaluronidase in increasing the penetration power of spermatozoa. It had been hoped from preliminary studies by Raphael Kurzrok and others that the addition of this crystalline substance, derived from the spermatic fluid of bulls, would be of benefit in instances of sterility apparently due to male faults such as lowered total numbers or lowered motility of sperms. Kurzrok in a preliminary study was successful in obtaining pregnancies by artificial insemination in an encouraging, though still small, number of cases. The group conducting sterility studies at Saint Margaret Memorial hospital, Pittsburgh, Pa., using hyaluronidase added to spermatic fluid for artificial insemination where female faults were not more than minor factors, in a series of cases, failed to find any favourable effects, no pregnancies having resulted. Theoretically, the procedure should be of value, but in practice was still doubtful.

Several new, absorbable, haemostatic agents developed for general surgical use were found of high value in the special field of gynaecology. These are fibrin-foam (a by-product of serum albumen), oxidized cellulose (cellulosic acid) and gelatin

sponge. These haemostatic agents are applied directly to raw, oozing surfaces within the pelvis and the abdomen closed in the usual way with the assurance that they will presently absorb. The principle of their action is that they aid in the formation of and give structural support to clots.

Gypsum. The decline in the demand for building materials after the peak of war construction is reflected in the basic data of the gypsum industry in the United States shown in the following table.

Data of Gypsum Industry in the U.S., 1939-45

(Thousands of short tons)

	1939	1940	1941	1942	1943	1944	1945
Mine output	3,227	3,699	4,789	4,698	3,878	3,761	3,812
Imports	1,308	1,405	1,348	394	231	342	509
Supply	4,535	5,104	6,136	5,092	4,109	4,104	4,320
Sales	4,092	4,632	5,760	4,953	4,186	3,838	3,987
Crude	868	929	1,321	1,458	1,234	1,056	1,148
Industrial	110	123	152	145	164	200	158
Building	3,114	3,580	4,287	3,360	2,788	2,582	2,681

The expected postwar upturn in building activity was not manifest in the gypsum industry during 1945. Production rose to 3,811,723 tons, only 1% over 1944, but imports rose 49% to 508,762 tons, giving a 5% increase in supply. Conditions improved somewhat in the first half of 1946; production of gypsum board, the largest item in building use, increased 38% over the same period of 1945.

In Canada, the world's third largest producer, the postwar recovery began to show in 1944 with an output of 596,164 short tons, against 446,848 tons in 1943, and continued with 822,380 tons in 1945 and 499,150 tons in the first half of 1946. Normally the United States takes the bulk of the Canadian output, and as is shown above, United States imports increased in 1944 and 1945. Great Britain is the second largest producer, with 1,532,117 short tons in 1943, and 1,482,041 tons in 1944.

(G. A. Ro.)

Haakon VII (1872-), king of Norway, of whom a biographical account will be found in *Encyclopædia Britannica*, was born Prince Charles of Denmark, second son of Frederick VIII (and brother of Christian X). Upon the separation of Norway from Sweden he was elected king by the Norwegian storting (Nov. 18, 1905), and took the old Norse name of Haakon, and that of Olav for his son, the crown prince. Haakon married Maud (1869-1938), youngest daughter of King Edward VII of England.

King Haakon held himself in the background during 1946, but he was a hard-working monarch, carefully studying men and conditions in postwar Norway. He was the central figure in Norwegian unity in peace as he had been in the strained years of war and exile.

No extraordinary event marked his reign in 1946, which is perhaps the highest praise for both king and citizens. (See also NORWAY.) (F. D. S.)

Hackworth, Green Haywood (1883-), U.S. lawyer and jurist, was born on Jan. 23 in Prestonburg, Ky. He studied at Valparaiso university, Valparaiso, Ind., the Georgetown university law school and George Washington university, Washington, D.C. He was attorney for the state department (1916-18) and solicitor (1918-25); he served on the special mission that drafted the U.S.-Turkish treaty at Lausanne in 1923 and was on the mission that negotiated the U.S.-Spanish commerce treaty in Madrid. He was appointed legal adviser to the state department July 1, 1931, and became U.S. member to the Permanent Court of Arbitration at The Hague, March 9, 1937. During World War II Hackworth attended many important international conferences and was a member of the U.S. delegations at the Moscow conference (1943), the Dumbarton Oaks parley (1944), the Inter-American Conference on Problems of War and Peace at Mexico City (1945), the United Nations conference in San Francisco (1945) and the U.N. sessions in London (Jan.-Feb. 1946). He was elected to the post of justice of the U.N. International Court of Justice on Feb. 6, 1946, for a six-year term.

Hackzell, Anders Werner Antti (1881-1946), Finnish diplomat, was born in Mikkeli. Early in his career as a lawyer, he represented Finnish businessmen and patriots in Russian courts. After his country achieved independence, he became Finnish envoy to Moscow (1922-27) and served as foreign minister (1932-36). When Field Marshal Carl Gustav Mannerheim, who took over the presidency of Finland on Aug. 1, 1944, selected a "peace cabinet" of soviet experts, he appointed Hackzell to the post of prime minister on Aug. 8, replacing Edwin Linkomies. Finland, then preparing for an armistice with the soviet, was in the process of breaking its alliance with Germany to which Linkomies had been committed. Prime Minister Hackzell was faced with the task of severing Finland's nazi connections and establishing a satisfactory basis for an armistice with the soviets. While negotiating the terms in Moscow, as head of the peace delegation in Sept. 1944, he suffered an apoplectic attack, from which he was left paralyzed. He died in Helsinki on Jan. 15.

Haiti. A West Indian republic occupying the western third of the island of Hispaniola or Haiti. Estimated area 10,695 sq.mi.; pop. (1944 est.) 3,000,000. Racial distribution is estimated at 95% Negro and almost all of the remainder mulatto. The capital is Port-au-Prince (pop. est., 125,000); other cities are Gonaïves (20,000), Les Cayes (15,000), Cap Haïtien (15,000), Jacmel (10,000), St. Marc (10,000) and Jeremie (8,000); only about 10% of the total population is urban. French is the official language, but a patois called creole is widely spoken. The official religion is Roman Catholicism but many persons in remote areas practice the folk religion of voodoo. Presidents in 1946: Élie Lescot, to Jan. 11; military junta headed by Maj. Frank Lavaud, Jan. 11-Aug. 16; Dumarsais Estime, following Aug. 16.

History.—Relatively calm political conditions were rudely interrupted in Jan. 1946 by a successful revolution. Disturbances began in Port-au-Prince early in the month and, in consequence, Pres. Lescot reorganized his cabinet on Jan. 10. An army coup d'état occurred the following day, however. Its quick success resulted in the immediate resignation of Lescot (he was exiled to Miami, Fla., Jan. 14) and the elevation of its leader, Maj. Frank Lavaud, to the provisional headship of the government. The army junta at once promised free elections for a constituent and legislative assembly, restoration of complete civil liberty and other democratic measures. Almost 1,000 candidates contested the 58 seats in the elections held May 12; the Demo-

cratic party, representing the mulatto ruling class, captured 56 of the 58 seats in the assembly. The body met first as a constituent assembly to elect a new president and draft a new constitution. On Aug. 16 the assembly chose Dumarsais Estime, aged 46, a member of the Democratic party and a former minister of education, as president. The new constitution, not completed by the end of 1946, reputedly included severe restrictions on foreign ownership of property and participation in business. The new regime conceded to labour the right to organize, but developments in the latter part of the year led some foreign observers to conclude that the mulatto minority would continue to dominate Haitian affairs.

Education.—Educational statistics are of very doubtful accuracy. The latest figures in 1946 indicated about 850 primary schools with some 85,000 enrolled, 35 intermediate schools with almost 6,000 enrolled and 6 schools of higher education (not organized as a university). Illiteracy was estimated at 92% of those more than 10 years of age.

Finance.—The monetary unit is the gourde, fixed by law at 20 cents U.S. Revenues for the fiscal year ending Sept. 30, 1946, totalled 44,557,227 gourdes (1944-45: 41,980,043). The unobligated treasury surplus on Sept. 30, 1946, amounted to 7,075,834 gourdes as against 6,832,894 gourdes one year earlier. Gross public debt Sept. 30, 1946, totalled 49,488,437 gourdes as against 52,936,369 gourdes one year earlier. The Haitian and United States governments concluded an agreement May 27 to modify the executive agreement of Sept. 13, 1941, regarding amortization of United States loans made in 1922-23. The 1941 agreement had provided for annual payments of \$700,000; the new agreement pledged payments of \$400,000 for the first six months of the fiscal year with the remaining \$300,000 to be paid in equal installments in May, June and July if the revenue outlook were for at least 35,000,000 gourdes. Total U.S. Export-Import Bank commitments to Haiti June 30, 1946, were \$8,100,000, all listed as the amount outstanding.

Trade and Communication.—The favourable balance of trade at the close of the fiscal year, Sept. 30, 1946, was 34,509,000 gourdes, the highest from 1918-19. U.S. exports to Haiti in the calendar year 1945 were \$9,400,000 (1944: \$9,200,000); U.S. imports from Haiti were \$16,000,000 (1944: \$12,500,000); the United States accounted for 79.4% of all Haitian foreign trade in the fiscal year 1944-45. Highway mileage is approximately 1,800 and railway mileage 88.

Agriculture.—Estimates of production of various crops for 1945-46 were: cotton, 13,255 bales (of 478 lb. av. wt.); durra (millet), 225,000,000 lb.; corn, 120,000,000 lb.; rice, 41,600,000 lb.; sugar, 43,816 short tons. Agricultural prospects for 1947 were considered good late in 1946.

Hammer Throw: see TRACK AND FIELD SPORTS.

Hand-ball. The year 1946 witnessed the first postwar tournament in national A.A.U. four-wall hand-ball competition. The annual classic was held at the Olympic club of San Francisco, Calif., with a number of sectional champions, many but recently out of military service, competing. The singles crown was won by Angelo Trulio of Brooklyn, N.Y., who displaced the nine-time titleholder, Joseph P. Platak. Trulio defeated Platak in the semifinals and went on to win the crown from Gus Lewis. An interesting feature was that Trulio had won the title once before in 1932. The doubles championship was retained by Frank Coyle and Edward Linz of the New York A. C., winners of this event on three previous occasions. There were no national tournaments in the one-wall competition

during 1946.

National Four-Wall Rankings for 1946

Singles	Doubles
1. Angelo Trulio, Brooklyn, N.Y.	1. Frank Coyle and Edward Linz, New York, N.Y.
2. G. Lewis, Buffalo, N.Y.	2. Walter Plekan and G. Lewis, Buffalo, N.Y.
3. Walter Plekan, Buffalo, N.Y.	3. W. Keays and B. Maguire, San Francisco, Calif.

(Fr. Ro.)

Hannegan, Robert Emmet (1903-), U.S. politician and cabinet member, was born June 30 in St. Louis, Mo. He took his law degree at St. Louis university, 1925. He started his political career in 1933 as a democratic committeeman of a St. Louis ward. By the end of that year, he had become chairman of the city central committee and was becoming an important figure in the Democratic political machine.

In May 1942, Hannegan was appointed by President Roosevelt to the post of collector of internal revenue of the eastern district of Missouri. In Oct. 1943, he was appointed commissioner of internal revenue in Washington, D.C. He was named chairman of the National Democratic committee on Jan. 22, 1944. On May 2, 1945, President Truman announced the appointment of Hannegan as postmaster general of the U.S. and he took office June 30.

Disturbing signs of disunity in Democratic ranks led him to warn (March 21, 1946) that congressmen who failed to follow the party line might cause the party's defeat in the November elections. In November, after the G.O.P. had won control of both houses of congress, Hannegan temporarily relinquished his duties as party chairman to take a two-month rest because of illness.

Hansson, Per Albin (1885-1946), Swedish statesman, was born on Oct. 28 in the province of Scania, Sweden. His formal education was brief, consisting of but four classes in a public school, and until 1905 he worked as an errand boy and grocery clerk. When he was 24 years of age, he was editor of the newspaper, *Fram*, and a delegate to the junior branch of the Social-Democratic party. In 1914, he joined the editorial staff of the official party paper, the *Social-Demokraten*, and by 1917, he was managing editor. Elected in 1918 to the second chamber of the Swedish riksdag on the Social Democratic ticket, he became minister of defense. Despite his strong anti-militarist convictions, he continued to serve in this dual capacity, with only brief interludes, until 1926. In 1932, he was elected prime minister and continued throughout World War II in this post. With the start of that conflict, he directed all of his efforts toward maintaining the neutrality of Sweden. On Dec. 13, 1939, a coalition cabinet was formed under his leadership. By May 1940, he declared that Sweden would not sanction use of its territory by belligerents.

However, in June 1941, the government acceded to a German demand for passage across Sweden of a division of soldiers from Norway to Finland. To those who criticized the government's policy, he replied: "The foremost task of the government is still to keep Sweden out of the war and to safeguard her freedom and independence." As the war progressed he demanded absolute preparation for defense against aggression and on Jan. 18, 1943, stated emphatically that Sweden, if attacked, would fight.

Two months after the end of the European conflict (July 1945), the premier and his cabinet resigned and a new Social Democratic government was formed with Hansson still its leader and prime minister. He died at Stockholm on Oct. 5.

Harbours: see RIVERS AND HARBOURS.

Harriman, William Averell (1891—), U.S. diplomat and government official, was born on Nov. 15, the son of E. H. Harriman, railroad magnate. After graduating from Yale university in 1913, he entered railroading, eventually becoming chairman of the Illinois Central and the Union Pacific railroads as well as a partner in Brown Brothers, Harriman and Co. He entered government service in the early days of the New Deal, serving as National Recovery administration administrator, member of the business advisory council of the department of commerce and director of the raw materials division of the Office of Production Management. In March 1941 he was sent to Great Britain as lend-lease administrator with the rank of minister and in August of that year he headed the U.S. delegation of a joint U.S.-British mission to Moscow. On Oct. 1, 1943, Pres. Roosevelt named him ambassador to the U.S.S.R. and Harriman attended the tripartite conferences there the following month. He later attended the Yalta and Potsdam conferences and also the Big Three parley in Moscow in December 1945. Harriman resigned his post as ambassador to Moscow, Feb. 14, 1946, and the following month (March 23) succeeded John G. Winant as U.S. ambassador to Great Britain. On Sept. 22, however, he was appointed secretary of commerce, succeeding Henry A. Wallace in that post. The following day Harriman declared that he endorsed the Truman-Byrnes foreign policy and expressed his belief that the commerce department should remain out of foreign politics.

Hart, William S. (1872–1946), U.S. actor, was born on Dec. 6 in Newburgh, N.Y. Dissatisfied with his humdrum existence as a postal clerk in New York city, he haunted the theatrical casting offices and finally made his way behind the footlights in small roles. In the 1890s he established a reputation as an actor of force and polish and soon became one of Broadway's leading Shakespearean interpreters. He also had starring roles in melodrama. Like other Shakespearean actors—notably William Farnum and John Barrymore—who left the footlights for the screen, Hart went to Hollywood in 1914, and there he made a sensational success in western pictures. However, the scope for acting in the early "horse-operas" was limited and Hart soon became typed as the tall, stern hero, whose face only relaxed in a smile during the final fadeout when he clasped the heroine in his arms. Some of his better known films were *The Toll Gate*, *Square Deal Sanderson*, *Wagon Tracks*, *Sand*, *White Oak*, *Tumbleweeds* and *Singer Jim McKee*. During the height of his success, Hart had his own studio where he produced his western action films. He later turned to writing, producing several juvenile books and an autobiography, *My Life East and West* (1929). Many of his old films were turned over to the film library in the Museum of Modern Art. He died in Los Angeles on June 23.

Harvard University. Founded in 1636, Harvard university is the oldest institution of higher education in the United States. Gifts during the academic year 1945-46 totalled \$6,235,887.

In 1946, all departments of the university continued to operate on a 12-month, 3-semester schedule, with two regular 16-week terms and an optional intensified 12-week summer term. This system made it possible for a student to be graduated by Harvard in three years instead of the normal four. All departments of the university had special arrangements for war veterans.

During the year the university was straining all its old resources and developing new ones to accommodate veterans and young men fresh from secondary schools as well as returning

upperclassmen newly out of uniform. The opening of the fall term on Sept. 23, 1946, found the university enrolling an all-time record total of more than 12,000 students. This total continued to grow through the term. New dormitories, new living quarters for married veterans, new laboratories and vastly augmented equipment were still in process of installation. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Hauptmann, Gerhart (1862–1946), German author, was born on Nov. 15 in Obersalzbrunn, Silesia. For his early career, see *Encyclopædia Britannica*. One of Germany's greatest dramatists and literary figures of the 20th century, Herr Hauptmann achieved fame in 1892 with his celebrated play, *The Weavers*. In 1912, he was awarded the Nobel prize for literature. Although it was not believed that Hauptmann endorsed the nazi regime, he did not publicly condemn its excesses and accepted honours from the Hitler government. His 75th birthday was celebrated by the State theatre in 1937–38 with productions of six of his plays, including such later works as *The Daughter of the Cathedral* and *The Golden Harp*. After the close of World War II, he accepted an invitation of the soviet military government to move to Berlin. He died at his home in Agnetendorf, Silesia, on June 8.

Hawaii. The territory of Hawaii consists of a group of 8 larger islands and numerous islets in the Pacific ocean between latitudes 18° 55' and 22° 15' N. and between 154° 50' and 160° 30' W. longitude. The total land area is 6,441 sq.mi. The islands are of volcanic origin. From southeast to northwest they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition stretching northwestward beyond Niihau more than 1,100 mi. is an archipelago of rocks, reefs and shoals including Midway (longitude 177° 22' W.) which, although part of the archipelago, is not politically a part of the territory. The capital of the territory is Honolulu, on the island of Oahu. It is a completely modern city. Its 1940 census population of 179,326, exclusive of military and naval personnel, was estimated to have increased to 261,033 on June 30, 1945. The civilian population of the territory in 1940 was 423,330. The 1946 estimate was 519,503. The proportion of noncitizens in the population, which in 1940 was only 19.5%,

DAMAGED PIERS and small boats near Honolulu, Hawaii, after tidal waves hit the area on April 1, 1946

was still further reduced by death and migration.

History.—Ingram M. Stainback, appointed by the president, entered on his second term as governor on Aug. 24, 1946. Joseph R. Farrington was re-elected territorial delegate to the congress in 1946. General fund revenue receipts of the territorial government for the year ended June 30, 1946, amounted to \$28,065,240.72, of which \$26,684,913.35 was derived from taxes and \$1,380,327.37 from rent, interest and earnings. Government cost payments for the same fiscal year totalled \$23,060,168.64. As of June 30, 1946, the territorial government had a general fund current surplus of \$11,687,496.61. Outstanding bonds of the territory totalled \$14,737,000, as compared with \$26,278,000 on June 30, 1945. Bills were introduced in the congress many times to enable the people of Hawaii to become a state. In a plebiscite in 1940 there was a favourable vote of approximately 2 to 1 for statehood. The record of the territory during World War II, when its residents played a steadfast and vital part in assuring the defense of the U.S., gave a marked impetus to the movement. Further encouragement was given when, in Jan. 1946, a committee of the congress, after holding detailed hearings in Hawaii, recommended that immediate consideration be given to the statehood legislation.

Agriculture.—Hawaii's chief crops and the bases of its industry were sugar and pineapples. Sugar production totalled 821,216 tons in 1945 compared with 951,411 tons in 1940. Canned pineapple produced in 1945 amounted to 10,030,836 cases, and canned pineapple juice to 7,891,793 cases.

(E. G. A.)

Hay. The U.S. production of hay of all kinds in 1946 estimated by the U.S. department of agriculture was 100,860,000 tons compared with 108,559,000 tons harvested in 1945 and a 10-year average of 91,306,000 tons 1935-44. This 1946 crop was the smallest in five years but was exceeded only twice prior to 1942, indicating the unusually favourable weather that favoured crop production during World War II. The yields were lower than in 1945 of both wild hay and alfalfa in most states. The total acreage changed little, being 74,352,000 ac. in 1946 and 77,017,000 ac. in 1945 compared with an average of 70,431,000 ac. in 1935-44. A slight increase in clover and timothy offset a decline in alfalfa.

The total crop included 31,817,000 tons of alfalfa, 34,330,000 tons of mixed clover and timothy and 11,530,000 tons of wild hay. Small quantities of various other crops made up the remainder. Alfalfa made up about one-third of the total and continued to be grown in about the same acreage as in prewar years. The leading alfalfa-producing state was California with more than 4,623,000 tons, Minnesota 1,917,000 tons and Nebraska 1,786,000 tons. Of clover-timothy New York led with 4,676,000 tons, Wisconsin 4,383,000 tons, Iowa 3,454,000 tons.

The big production of wild hay was in South Dakota 2,024,000 tons, North Dakota 1,978,000 tons and Nebraska 1,836,000 tons. Increasing quantities of lespedeza, sweet clover and soybean hays were being produced and stored in mow and silo.

The carry-over of about 16,000,000 tons of old hay on May 1, 1946, together with the new crop of 96,000,000 tons, provided a supply of 1½ tons per hay-consuming animal. This supply was only slightly lower than in 1945 and one-tenth of a ton more than the prewar average.

Hayseed.—The weather was favourable for seed production in 1946 and the harvest was large for most varieties. Alfalfa seed turned out 1,658,400 bu., about 9% more than the previous record in 1939 and 40% more than 1945. The yield was about the average of 1.55 bu. per acre but the acreage harvested was 40% more than the average. Red clover seed harvested was almost equal to the record of 1929, 2,112,800 bu. compared

with the average of 1,314,420 bu. The yield was .82 bu. per acre on 2,584,000 ac., the largest area ever harvested. Alsike production was estimated at 390,200 bu., 11% more than 1945 and 28% more than average. This increase was because of a yield of 2.62 bu. per acre compared with 2.29 bu. in 1945 and 2.23 bu. average. Sweet clover seed turned a better yield and the crop was 616,000 bu. compared with 883,550 bu. Lespedeza seed production was 213,900,000 lb. compared with 187,000,000 lb. in 1945 and an average of 143,169,000 lb. Both acreage and yields were higher since this crop was expanding steadily. The timothy seed crop was 1,398,000 bu. compared with an average of 1,783,130 bu., 1935-44. Redtop seed was estimated at 16,100,000 lb. in 1946, near the average of 16,380,000 lb. Sudan grass seed was 21% below the crop of 1945 at only 23,000,000 lb. compared with an average of 57,514,000 lb., 1935-44. The acreage harvested was only 58,000 ac. compared with an average of 158,000 ac. The demand for seeds was strong throughout the year, large amounts going for European relief at prices well above the average. (See also ALFALFA; SOYBEANS.)

Heart and Heart Diseases. Two occurrences in particular marked the advances in the cardiovascular field in 1946. The first was the Second Inter-American Cardiological congress held in Mexico City in October. Prof. I. Chavez presided and, for the first time following the conclusion of World War II, invited guests were able to come from across the water. These guests from Europe who addressed the congress included Prof. Charles Laubry, Gaston Giraud and M. D. Routier of France, Prof. Ivan Mahaim and P. Duchosal of Switzerland, Prof. Jean Lequime of Belgium, Prof. Herman A. Snellen of the Netherlands, Prof. Erik Warburg of Denmark, Prof. G. Nylin of Sweden, Prof. Joseph Brumlik of Czechoslovakia and Prof. Vittorio Puddu of Italy. Many recent advances were discussed at this congress, some word of which will be presented below. An international council was organized to arrange for international co-operation in the study and treatment of heart disease and for the initiation of an International Cardiological congress at some time in the future. This committee consisted of Laubry of France, John Parkinson of England, Nylin of Sweden, N. D. Staschesko of the U.S.S.R., A. C. Taquini of Argentina, Jonathon C. Meakins of Canada, Chavez of Mexico, A. Hurtado of Peru, Paul D. White of the United States and some German-speaking cardiologist not then selected.

The second event was the resumption throughout much of the world of peacetime researches in the diagnosis and treatment of heart diseases. World War II, although it stimulated medical and surgical work along certain lines, was in general the cause of great retardation of advances in the cardiovascular field. With the release of many young medical investigators from medical service and of some of the older physicians from the overload of war duties, much new progress was expected.

New methods of study of the circulation were introduced. Two interesting developments in electrocardiography concerned the taking of endocardial electrocardiograms by way of cardiac catheterization. A. Battro of Argentina, for example, among others, obtained a large series of such cases and made thereof a report at the meeting in Mexico City. Duchosal of Switzerland ingeniously devised models of cardioelectrography which, if they could be obtained in a practical manner, might eventually prove to give patterns that are more distinctive than those obtained by other methods of electrocardiography. In a study of the veloc-

ity of the circulation there was a further development of the use of fluorescent materials and there was also an introduction of radioactively labelled erythrocytes with detection of their course in the circulation by Geiger counters. One of the most interesting developments concerned the use of catheterization of the heart for determination of pulmonary and right heart chamber blood pressure. The normal range was found to be about what had been anticipated before actual measurements were made; for example, right auricular pressure of -2 to $+2$ mm. Hg., and right ventricular systolic pressure averaging 25 mm. Hg. Under certain conditions, in particular mitral stenosis, left heart failure and congenital defects, this right heart pressure is greatly raised. Blood pressure curves in the pulmonary artery, right ventricle and right auricle were being recorded with the help of the Hamilton manometer.

Further developments also took place in the vascular surgery concerned with congenital defects and more experience was gained in the operations already introduced, in particular those of ligation of the patent ductus arteriosus, plastic surgery on the coarcted aorta and arterial anastomosis for pulmonary stenosis, in particular the tetralogy of Fallot. A new technique of anastomosing the pulmonary artery and aorta in the last-named condition was introduced by W. G. Potts, S. Smith and S. Gibson. Up to Jan. 1947 no surgery to correct intracardiac defects had been clinically introduced.

Intensive studies of hypertension and its treatment were also initiated. Trial of such drugs as tetraethylammonium bromide (or chloride) which has a specific effect on the sympathetic nerve ganglia with a marked reduction of blood pressure for some hours after administration was suggested as a means of testing the suitability of patients for sympathectomy in serious hypertension. The applicability of this therapy in the treatment itself is unsuitable because of its side effects. The reversibility of hypertension and hypertensive heart disease was clearly shown in many patients by symptoms, signs, X-ray study and electrocardiogram following specific treatment of hypertension, especially by lumbodorsal sympathectomy and also by the rice diet.

Coronary heart disease was under intensive study, particularly from the standpoint of its etiology. Young coronary heart cases of 40 years of age and younger were analyzed from the standpoint of the cholesterol content of the fasting blood and the basal metabolic rate. In the majority of young cases the fasting blood cholesterol was much too high and the basal metabolic rate low in level, approaching or even exceeding -20% . The prophylactic use of thyroid therapy in these young cases was initiated. A related study in these young coronary heart patients is that of an analysis of body build by the help of anthropometry. It was the general impression, which, however, needed confirmation or the reverse, that most of the early cases occur in the more masculine males.

Pulmonary embolism as a hazard in medical patients was clearly demonstrated and its treatment discussed. At the Massachusetts General hospital a study over a period of ten years of the incidence of pulmonary embolism in the medical and surgical wards showed more than twice the incidence in the medical patients as in the surgical patients postoperatively. The majority of the medical patients were cardiac cases who had been at rest or were invalids. The use of bilateral leg vein ligation and of anticoagulants was advocated and in both instances with definite benefit. The former is a more permanent protection. Either method of treatment may be lifesaving if carried out soon enough.

Finally, in the prevention and treatment of important cardiac arrhythmias, quinidine sulphate continued to be used freely and beneficially. A difficulty arose during World War II in the

United States because of the lack of supply of this drug. As a result, synthetic quinidine (developed from quinine) and dihydroquinidine were tested out to see if they would serve the purpose of the commercial quinidine. It was found that these two preparations were effective but that quinine, on the other hand, was much less satisfactory. Fagarine, a new drug being tested in Argentina, was suggested as a possible substitute for quinidine, but up to Jan. 1947 it had not been proved as effective or safe.

Helium. Although no official report was made revealing the progress in helium output in the United States during World War II, it was generally known to have increased several fold, through the addition of new plants and the enlargement of the single prewar plant. The latest official statistics available at the close of 1946 placed the output at 9,500,000 cu.ft. in the fiscal year 1939-40, 16,173,000, cu.ft. in 1940-41, and 15,721,000 cu.ft. in the second half of 1941, and while no later figures were given, a report stated that postwar output could supply for industrial and scientific use, over and above government requirements, monthly amounts up to 10,000,000 cu.ft. The chief war uses were for the inflation of blimps for submarine patrol work, the inflation of weather observation balloons, and the provision of an inert atmosphere for the arc welding of magnesium. (G. A. Ro.)

Hemp. The war boom in hemp-growing for fibre ended with the 1944 crop when 72,600 ac. was grown in five states. In 1946 only 4,600 ac. were planted for fibre, all in Wisconsin, and a yield of about 975 lb. of fibre per ac. was expected in December. Only 400 ac. were planted for hempseed, all in Kentucky, returning a crop of 212,000 lb. The growth of the crop was under the control of War Hemp Industries, Inc., a government agency. At the maximum period of development there were 42 processing plants in operation. Domestic hemp production could not compete with the imported product because of the low price of the latter. In prewar years most of the United States supply came from Italy. Imports averaged around 700 tons before World War II but increased to 1,195 tons in 1941 and 2,144 tons in 1942. World War II cut off imports which began to increase in 1946. (J. C. Ms.)

Herriot, Edouard (1872—), French politician, was born July 5 at Troyes in Champagne. See *Encyclopædia Britannica* for his early career. The elections of May 1932, marked by a swing to the left, brought Herriot back into power as premier and foreign minister for the third time. While he opposed Germany's claim to armament equality, he did agree at the Lausanne conference, June 1932, to reduce Ger-

man reparations. Herriot insisted that France should pay its war debt instalment to the U.S. at the appointed time, but the chamber of deputies balked and his government was overthrown on Dec. 14, 1932. Herriot was vice-premier in the Doumergue cabinet (1934) and the Flandin government (1936), and in June 1936 he was elected president of the chamber of deputies.

He remained in France after the German occupation in June 1940 but was arrested in 1942 for protesting against Henri Pétain's dissolution of the permanent bureaux of both houses of parliament. He was liberated by soviet troops from a German prison camp in April 1945 and returned to France. He testified at the trial of Pétain (July 30, 1945) and accused the aged marshal of having staged a coup d'état in 1940 when he abolished the third republic. Herriot resumed leadership of the Radical Socialists and was elected to the national assembly Oct. 21, 1945. He was re-elected in the national balloting on June 2 and Nov. 10, 1946, and was named to the French academy on Dec. 15. The following month he was elected president of the national assembly of the fourth republic (Jan. 21, 1947).

Hertz, Joseph Herman (1872–1946), British rabbi, was born on Sept. 25 in Rebrény, Hungary, and was educated in the United States. In 1913 Dr. Hertz became chief rabbi of the United Hebrew Congregations of the British empire and thereafter took a leading role in Zionist affairs, associating himself with numerous organizations working for the advancement of British Jewry. He was made a Companion of Honour in 1943. Dr. Hertz died in London on Jan. 14. (See *Encyclopædia Britannica*.)

Hess, Rudolf Walther (1894–), German politician, christened Richard Rudolf, was born on April 26 at Alexandria, Egypt. He studied in Switzerland and at Godesberg, Germany, and met Adolf Hitler while serving in the German army during World War I. He participated in the Munich beer hall putsch on Nov. 9, 1923, was imprisoned with Hitler in the Landberg fortress and in 1925 became Hitler's personal secretary. After the nazis took power, he was appointed (April 21, 1933) as personal deputy of the fuhrer, and on Dec. 1 of that year he was named reich minister without portfolio. Hess gave vigorous support to Hitler's policy of rearmament.

On May 10, 1941, Hess made a spectacular and "unauthorized" flight from Germany to Scotland, to bring peace proposals to the British. The British held him incommunicado throughout the war. At the time nazi authorities tried to explain his flight on grounds that he was suffering from "hallucinations and a mental disease." Subsequently it was revealed at the Nuernberg trial that Hitler knew of Hess' peace proposals but had no knowledge of his intended flight.

Hess allegedly was suffering from a mental ailment in 1945 when the international military tribunal opened the trials of war criminals at Nuernberg, and he created a sensation on Nov. 30 when he declared that he was in full possession of his senses and that he had been feigning amnesia. The court, in its final verdict, said that there was not sufficient evidence to establish Hess' guilt on charges of committing war crimes and crimes against humanity. However, it did find him guilty of conspiracy to commit acts named in all three counts and of crimes against the peace and he was sentenced to life imprisonment, Oct. 1, 1946.

Highways: see ROADS AND HIGHWAYS.

Hillman, Sidney (1887–1946), U.S. labour leader, was born at Zagare, Russia (then in Lithuania) on March 23, the son of a merchant. He became active in

Russian revolutionary movements and, hounded by tsarist police, he fled to England. He then emigrated to the United States (1907) where he worked first as a clerk and later as a garment cutter. He became a labour organizer, and in 1915, the first president of the Amalgamated Clothing Workers of America, a position which he held until his death. After a period of bitter struggle, the organization won almost universal adoption of a 44-hour work week in the clothing industry, substantial wage increases and establishment of management-employee relations on a stable basis. By the time of Hillman's death, the union's membership had increased to about 350,000. In 1933, President F. D. Roosevelt named Hillman as a member of the NRA's Labor Advisory board, and in 1935 he was appointed a member of the National Industrial Recovery board. (Subsequently, he was named as one of the vice-presidents of the Congress of Industrial Organizations). He became a key figure in U.S. defense activity in 1941 when Roosevelt made him associate director general of the Office of Production Management and director of its labour division. In that capacity, he played an important part in preventing and settling strikes on defense projects. In July 1942, he resigned his post as special assistant to the president on labour matters to resume active guidance of the A.C.W.A. The following year, he became chairman of the C.I.O.'s Political Action committee, which, it was conceded, had effectively mobilized enough labour and liberal votes to elect Roosevelt to his fourth term in 1944. In 1945, Hillman attended the World Trade Union conference in London, where he urged (Feb. 13) prompt creation of a new permanent World Labour organization to speak for labour in the peace settlement. He was elected, Oct. 6, 1945, as one of the vice-presidents of the new World Federation of Trade Unions. Hillman headed a W.F.T.U. commission that went to Germany in early 1946 to study labour conditions; the body reported on Feb. 27 that the occupation authorities of all four zones still maintained nazis in responsible administrative positions. He died at Point Lookout, L.I., N.Y., on July 10.

Hirohito (1901–), emperor of Japan, was born April 29, the son of Emperor Yoshihito. For his early career, see *Encyclopædia Britannica*. On Pearl Harbor day, Dec. 7, 1941, he proclaimed the nation at war with the United States and the British empire. During the early part of World War II, when Japan was amassing victories, the emperor remained in semi-seclusion. Toward the end of the war, however, he admitted in an imperial rescript that the situation was "truly grave." After the Potsdam declarations, the atomic bombings and Russia's entry into the war, the Japanese indicated they were willing to end the conflict provided the emperor retained his prerogatives. President Truman answered (Aug. 11, 1945) that Hirohito would be permitted to retain his throne for the time being, subject to the authority of the supreme Allied commander. Thus Hirohito on Aug. 15 (Tokyo time), 1945, broadcast to his subjects that he had ordered acceptance of the "provisions of the joint declaration" of the Allied powers. He later blamed Hideki Tojo, former premier, for "misusing" his war rescript, and pledged that any social reforms in Japan would be made by constitutional means. In a rescript issued Jan. 1, 1946, the emperor declared to be false the "conception that the emperor is divine and that the Japanese people are superior to other races and fated to rule the world."

In keeping with his new character as a "mortal," the emperor made several tours among his people in 1946 and during a visit to war-damaged areas in Yokohama on Feb. 19, he stopped and talked with women workers in industrial plants; subsequently the soviet authorities were said to have complained that Hirohito's freedom to travel permitted him to build up sentiment

favouring the monarchy. On Nov. 3 the emperor read an imperial rescript before the diet officially promulgating the new constitution which outlawed war as an instrument of national policy and reduced the throne to the status of a national symbol.

Hogs. The decline in hog production in the United States, begun in 1945 after the high record year of 1944, was checked in 1946. On Jan. 1, 1946, the number on farms was estimated by the United States department of agriculture at 62,344,000 head compared with 59,759,000 head a year earlier and the record number of 83,852,000 head of 1944. The annual pig crops likewise declined from the record of 121,706,000 pigs raised in 1943 to 81,424,000 head in 1946. The spring pig crop of 1946 was slightly above 1945 at 52,324,000 head while the fall crop was only about 30,000,000 head. The total pig crop was considered inadequate and the United States department of agriculture set the goal for the spring of 1947 at 58,000,000 head or about 11% above the 52,324,000 head produced in 1946, or about equal to the average for 1941-45. Large supplies of corn and other feeds were available and the 1946 spring pigs were fed out to heavy weights.

The slaughter of hogs in July-August was 36% above the same period a year earlier but then dropped to a low record when price control was restored in September and early October. Receipts at the markets were extremely responsive to the price changes. Hog prices were above both 1945 and the average for 1935-44 at \$14.30 through 1946 to July when the price control lapsed and the top of \$23 per 100 pounds was reached for October and an average of \$22.70 for December, compared with \$14 average for the whole year 1945.

Support prices on hogs were to be mandatory through 1948. A new schedule was announced by the government on Oct. 4, 1946, ranging, for different grades, from \$15 per 100 pounds on Oct. 1 to \$13 on Dec. 29. With the removal of all price ceilings on Oct. 15, 1946, prices again advanced, only to decline later when consumer demand slackened. Lard continued scarce.

Pork consumption at 69 lb. per capita continued higher in 1946 than in 1945 but below 1943-44. Lard consumption was only 11.3 lb. per capita in 1946 compared with 12 lb. in 1945. With the reduced purchases for relief and military forces the supply for civilians was increasing at the end of the year and appeared to equal the strong demand from heavy consumer employment. Home Economics. The American Home Economics association membership reached 16,637 in 1946. The national president reported that in 1946 the association gave leadership in the formulation of the permanent school lunch legislation and saw it come through to enactment; strengthened its support for legislation of particular interest to consumers; helped build a youth organization, the Future Homemakers of America, as a part of home economics programs in secondary schools; strengthened the 336 college home

economics clubs with memberships that reached 18,000 during the year; developed an apprentice training plan to include nursery schools, extension service teaching and home economics in business.

The association held 15 province "work shops" which were attended by about 700 students and faculty advisers from 150 of its college clubs.

The largest single project of the association in 1946 was the "Consumer Speaks" project with which 30 states co-operated on four projects dealing with house dresses, fruit, meat and household equipment.

U.S. Office of Education.—The enrolments in homemaking education federally reimbursed in 1946 showed a total enrolment of 912,941. Of these, 527,355 were recorded in all-day schools and 385,586 were recorded in part-time and evening schools.

Approximately two-thirds of the public high schools offered home economics courses, and approximately 66% of the girls and 5% of the boys in these schools were reached with home economics instruction.

During the school year 1945-46 conferences and classes in homemaking education for adults emphasized helping families with postwar problems in child development, family relationships and housing and money management in light of rising prices. Emphasis was also given in many schools to the problems of families in other lands, to the cultural contributions different forms of family life make to the world and to sharing material goods with peoples in other countries. Home, school and community projects carried on or participated in by high school home economics pupils stressed co-operation among family members and among school or community groups, particularly in improving living conditions with the materials available.

U.S. Bureau of Human Nutrition and Home Economics.—The outstanding accomplishments of 1946 included: An appraisal of the nutrition value of national food supply; devising an objective method for deriving family food budgets from customary food patterns in accord with a selected set of nutritional specifications; making a study of how foods supplement each other in nutritive value; continuing research on nutritive value of the aminoacid content of protein-rich foods of both plant and animal origin; developing further a study of dried eggs by adding powdered egg shell to increase calcium content of dried eggs; gathering information of importance to the development of the school lunch program; completing canning studies on 12 commonly canned low acid vegetables, two meats and one kind of poultry, which marked a long step forward in improving the canning process; developing considerable work on freezing and packaging foods at home for freezer storage in addition to developing useful information on handling food in home freezers when freezer service is temporarily interrupted.

Considerable work was done in 1946 on the following studies: miscellaneous clothing purchases which are a key to clothing buying-patterns of farm and urban men; durability of construction in cotton garments; home tailoring of women's garments and clothing conservation; quality of fabrics on retail market; knitted cotton fabrics; protective finishes for cotton fabrics.

Use of these research findings of the bureau of human nutrition and home economics was made in 1946 as follows: On popular requests, the bureau distributed 4,951,349 copies of its popular and technical bulletins. This included 29 printed and processed publications, 20 technical articles for professional journals, 159 popular articles and fact sheets for press and radio use; 31 radio scripts and broadcasts. In addition an educational motion picture, *Freezing Fruits and Vegetables*, was filmed.

The home economics extension service helped more than 2,225,000 families with preservation of home-raised food; helped about 17,000 schools to establish or maintain school lunch programs; made 2,000,000 and more contacts with families on clothing problems through classes or radio programs; helped 162,000 families and communities use electricity to better advantage; assisted more than 250,000 families in improving family relations; gave help to 201,779 families in child development and guidance; assisted 451,280 families with home recreation and gave considerable help with an expanding health program; gave assistance to 1,600,000 young people between 10 and 20 years of age who carried on one or more projects through 4-H clubs and to the 400,000 4-H club members who worked on home safety.

Experiment Station Research.—A survey of home economics research in land grant college institutions in reports both published and unpublished indicates that research on nutritive value of foods, human nutrition and home economics offered rich fields for investigation in 1946. There was considerable development and improvement in methodology. (See also DIETETICS; FOOD RESEARCH.)

Homma, Masaharu (1888?-1946), Japanese army officer, was an observer with the British forces in France during World War I. He served as Japanese resident officer in India, 1925, and as military attaché in London, 1930, and was decorated with the Military cross of the British empire. In 1939 he commanded Japanese forces at Tientsin, China, when the Japanese army blockaded the foreign concessions there. In Dec. 1941, a few days after the attack on Pearl Harbor, Homma, then a lieutenant general, led the Japanese invasion of the Philippines. Although it had been commonly supposed that Homma had been superseded by Gen. Tomoyuki Yamashita after the campaign had bogged down at Bataan and Corregidor, subsequent evidence suggested that Homma held the supreme command throughout the campaign.

He surrendered to U.S. army forces in Tokyo after the close of the war and in Dec. 1945 was brought to trial. He was formally charged with having been responsible for the "Death March on Bataan," which occurred shortly after the Japanese conquest and in which an estimated 17,200 Filipinos and U.S. soldiers were killed. The trial opened in Manila, Jan. 3, 1946, with a military commission presiding. Convicted, Feb. 11, for ordering the death march and for condoning other atrocities, he was sentenced to be shot. Homma's appeal to the United States supreme court was rejected. The general was executed by a firing squad at Los Banos, Luzon, on April 3.

Honduras. A republic of Central America bounded by Guatemala, El Salvador and Nicaragua. Area: 59,145 sq.mi. with 14,870 sq.mi. in dispute. Pop. (1945 official est.) 1,201,310, including approximately 35,000 tribal Indians. The capital is Tegucigalpa with a pop. (1945) of 55,715; other principal cities are San Pedro Sula (22,116) and La Ceiba (12,185); smaller urban centres are Puerto Cortés (about 8,000), Choluteca (5,000), Santa Rosa (6,000) and Tela (9,000). Religion: Roman Catholic; language: Spanish. President in 1946: General Tiburcio Carías Andino.

History.—The year 1946 was peaceful except for demonstrations by Democratic Action groups which were rigorously suppressed. Gen. Carías completed his 13th year as president without serious challenge, but early in the year he was reported to have promised to step down from power in 1947 and allow a free election of his successor with ample guarantees for the opposition. Dr. Octavio Williams, the vice-president, and Dr. Juan Manuel Gálvez, former cabinet member, announced their candidacies early and were seeking the support of Gen. Carías. A large measure of freedom of speech, assembly and press were allowed during the early months, after wartime state-of-siege restrictions were lifted late in 1945, but a wave of popular criticism of the Carías régime resulted in new suppression measures in July and August. Police raids broke up student mass meetings and closed newspaper offices in Tegucigalpa and other cities.

Food scarcities and black market operations as well as political suppression were noticeable during the year. Honduras did not participate in the movement for Central American reunion which was launched by the Salvadorean government.

Education.—There were 1,083 primary schools in 1944 with 53,956 students and 1,803 teachers; 21 intermediate schools had 2,787 students; and the national university had 367 students. Less than 25% of the school-age children were enrolled during 1944, and approximately 82% of the population was illiterate, but a nation-wide effort to reduce this figure was under way with each literate citizen under obligation to teach at least five persons to read and write each year.

Finance.—The monetary unit is the lempira, valued at 49.02 cents U.S. on Nov. 15, 1946, but U.S. coins account for almost half of the money in circulation. The budget for 1944-45 provided for expenditures of 11,384,521 lempiras. On June 30, 1946, \$800,000 was outstanding and \$1,700,000 remained undischarged of the total U.S. Export-Import bank credits authorized for Honduras.

Trade and Resource.—Exports during 1944-45 were valued at \$12,133,070, up 28% over the previous fiscal year, while imports (up 8%) amounted to \$13,247,486. The United States purchased 83% of the exports and supplied 66.5% of the imports. Bananas (12,906,716 stems) comprised 53% of the exports; silver (3,055,197 troy oz.), 11%; gold (21,746 troy oz.), 6%; coconuts (13,799,114 units), 6%; livestock (43,930 head), 5%; coffee (2,724,508 kg.), 4%; tobacco (1,597,992 kg.), 3%; cigars (91,558,000 units), 1%; and lumber, mostly mahogany and pine (1,667,103 bd.ft.), 1%. A new saw mill with a capaci-

ty of 6,000,000 bd.ft. a year was established on the south coast in 1946. The 1946 abacá crop was estimated at 5,800,000 lb. (2,520,375 lb. in 1945). Coffee was expected to fall 40% short of the 1945 production.

Communications.—The railways (about 900 mi.) were confined to the banana area of the north; highways (about 740 mi., 450 mi. surfaced) connected most of the chief cities; but airways (serving some 40 municipalities daily) remained the most effective means of internal communication. The government operated 2,321 mi. of telephone and 4,140 mi. of telegraph lines in 1944; fruit and mining companies operated 1,624 mi. of telegraph.

Hoover, Herbert Clark (1874–), U.S. statesman and 31st president of the United States (1929–33), was born Aug. 10 in West Branch, Ia. For his earlier career see *Encyclopædia Britannica*.

In March 1946 Hoover accepted Pres. Harry S. Truman's offer to investigate food conditions in Europe. As honorary chairman of the president's National Famine Emergency committee he toured the greater part of Europe and the far east. On his return to the United States he reported (May 13) that the world grain shortage of 3,600,000 tons could be eased by better co-operation from Britain and the soviet union plus more vigorous conservation in countries with grain surpluses. Shortly afterward Hoover departed for South America as U.S. "food ambassador" to enlist the help of the Latin American republics in staving off the world food shortage.

While in Lima, Peru, he made a denial of charges (June 4, 1946) appearing in South American Communist newspapers that he was playing politics with food; and on June 15 he said that Communists the world over were "trying to break down the provision of food for hungry people and thus produce chaos."

Hopkins, Harry Lloyd (1890–1946), U.S. politician, was born on Aug. 17 in Sioux City, Ia. He was graduated from Grinnell college (Iowa) in 1912 and then went to New York, where he engaged in social service work. He was called to Albany in 1931 by Gov. Franklin D. Roosevelt to take the post of executive director of the New York state temporary relief organization. When Roosevelt became president, he again called on Hopkins to come to Washington in 1933, to take over the post of federal emergency relief administrator. Hopkins thereafter organized and directed the Civil Works administration, the Federal Surplus Relief corporation and the Works Progress administration. In the next five years, during which Hopkins expended some \$10,000,000,000 for relief, he was the target of both praise and criticism.

By 1938 he had become a close adviser and personal friend of President Roosevelt, and the latter named him secretary of commerce in that year. Two years later ill health forced Hopkins to resign. In Jan. 1941, however, he went to London as the president's personal envoy. On March 27 of that year he was named lend-lease co-ordinator and journeyed to both London and Moscow to confer with high government officials on the lend-lease program. He was chairman of the Anglo-American Munitions Assignments board (1943) and attended the principal war conferences at Washington, Casablanca, Quebec, Cairo, Tehran and Yalta. He also was named to a special committee

to study manpower problems.

After the death of Roosevelt in April 1945, Hopkins remained to advise and assist Pres. Harry S. Truman. His last diplomatic mission was to Moscow, where (May–June 1945) he laid the plans for the Potsdam conference of the Big Three. His influence with Premier Joseph Stalin later smoothed over a snag at the San Francisco conference, where the United Nations were deadlocked over the issue of freedom of discussion in the Security council. Hopkins resigned as adviser to Pres. Truman on July 3, 1945, because of his failing health. He died in New York city on Jan. 29. (See also *Encyclopædia Britannica*.)

Hops. The 1946 hop crop in the United States was 53,171,000 lb. compared with 56,772,000 lb. in 1945 and a 10-year average of 39,631,000 lb., 1935–44. The yield was 1,306 lb. per acre which was above the 10-year average of 1,168 lb. but below the 1,395 lb. yield in 1945. Yields were reduced by September rains in Oregon and Washington, while California yields were

U.S. Hop Production by States, 1946, 1945 and 10-Year Average
(In pounds)

State	1946	1945	Average 1935–44
Washington	19,720,000	21,996,000	11,499,000
Oregon	18,800,000	20,398,000	17,719,000
California	14,651,000	14,378,000	10,413,000

about up to 1945. The season average price in 1945 was 70 cents per pound which was almost twice the parity price of 41 cents. Through 1946 prices rose steadily to an average of 90 cents for the year. (J. C. Ms.)

Hormones: see ENDOCRINOLOGY.

Horse Racing. Horse racing in North America, and especially in the United States, in 1945 had reflected the abnormal and disturbing conditions under which it was carried on, yet despite these it attained an altogether unexpected volume of success. In 1946, with these drawbacks for the most part removed, it registered gains far in excess of what might legitimately have been expected and registered new "highs" that were again surprising. The removal of wartime restrictions had, of course, much to do with this, but even with their being discounted, the official returns were sufficiently amazing.

There was \$32,300,000 distributed to the money-winners in 19,587 races run at "recognized" meetings held in the U.S., Canada and Spanish North America, between Jan. 1 and Dec. 31, 1945. In 1946 this rose to \$49,289,144 which was paid out to the money-winners in 23,941 races. The total attendance at these meetings rose from 17,227,548 to 26,834,218, during the same period. The total amount of money wagered in the totalizers rose from \$1,421,951,753 to \$1,794,386,668. Thus the daily average attendance rose to 11,177 persons and the daily average amount bet by them to \$747,350. The largest amount of money distributed in stakes and purses by any association was \$2,482,888, by the Los Angeles Turf club, of Santa Anita park, Arcadia, Calif. The largest daily distribution was \$52,070.57, by the Westchester Racing association, Belmont park, Long Island. About 19 different associations distributed more than \$1,000,000 each. The largest number of days' racing given at any one point was 103, at Pascoag, R.I., over a half-mile track. This, one of numerous similar so-called "merry-go-rounds" which such places provide for the use of taxation-revenue raising for state purposes, turned more than \$1,000,000 into the state treasury. (A "merry-go-round" is a meeting at which the horses racing and the contests are of the lowest possible grade.) Hence, it is not at all surprising that taken en bloc the 20 different states in which racing was held under legal provision received the sum of almost \$1,800,000,000.

STARTING GATE for harness races being demonstrated by inventor Steve Phillips at Westbury, N.Y., in 1946. Speed is increased gradually to get horses in gait and position. When they reach the starting point the wings are folded and the car leaves the track

In 1946 the King Ranch's three-year-old colt Assault, by earning \$424,195, placed to his credit the largest sum ever amassed by a race horse in a single season, the previous record having been \$308,275 by Gallant Fox in 1930. Besides this, the leading winning sire of 1946, Mahmoud (imported), was credited with a grand total of \$680,900 captured by his get, the previous leader having been War Admiral, whose get won \$591,352 in 1945. In this direction it is significant of the trend of the times to state that whereas War Admiral's credit was the first in history, at home or abroad, showing earnings of \$500,000 or more by the get of any single sire, in 1946 no less than seven different horses passed that "line of demarcation." Assault, aside from being voted the "Horse of the Year" was also voted the champion three-year-old; Col. C. V. Whitney's filly First Flight, the best two-year-old; Calumet Farm's Armed, the best handicap horse and W. L. Brann's Gallorette, the best all-aged mare. The honours as steeplechaser went to K. Miller's Elkridge. The leading money-winning stable was that of Calumet Farm, with a credit of 71 races and \$564,095. The leading money-winning trainer was H. Jacobs, with 99 races and \$560,077, but the leading race-winning trainer was W. Molter, with 122. Ted Atkinson led the jockeys both in points of races (233) and money (\$1,036,825). Such audits as these had the natural consequence of raising race horse values to new highs, for with single events being worth as much as \$100,000 to the winner, prices naturally kept pace. "The pulse of the market" is always gauged by the average selling price for yearlings at public sale. This rose from \$5,146.37 for 986 head in 1945 to \$5,983.42 for 1,265 head in 1946. The top price for a single colt, \$65,000, had, however, been excelled in previous seasons; but a unique record of its kind was set when in the late fall Mrs. Elizabeth N. Graham paid \$50,000 for a weanling colt by War Admiral—Baby League, by Bubbling Over, own brother of Busher, the "Horse of the Year" in 1945. A notable development of the season was the rush to import horses from foreign lands for both breeding and racing purposes with some very large prices being paid.

While the season did not proceed so sensationally with harness racing as with thoroughbred, it followed similar lines and was similarly successful. For the first time in history the Grand Circuit invaded California where a long spring meeting was

given at Santa Anita, the program including two \$50,000 events, won respectively by Kaola (trotting) and Blue Again (pacing), but as usual the richest event of the year was the Hambletonian stake for three-year-olds, worth \$57,485.57 and won by Chester-town, owned by Mr. and Mrs. Walter E. Smith. The strength of the trotting market was shown by the price of \$50,000 paid by an Italian buyer for the young stallion Dr. Spencer (1:59 $\frac{1}{4}$), the seller being E. J. Baker; and the same sum was paid for the two-year-old Hoot Mon (2:03 $\frac{1}{2}$), the season's leading stake-winner of his age. (J. L. HE.)

Great Britain.—In 1946 a return was made to a more normal racing program; more courses were opened, and the Derby and St. Leger were once again run on their own courses. Stake money showed a very substantial increase over the meagre prizes of the war years, the value of the Ascot gold cup alone having risen from £1,455 in the previous season to £7,200.

Unexpected results occurred in the races for the Two Thousand Guineas and Derby. At the close of the 1945 season among the six most promising two-year-olds were five colts by Hyperion: Gulf Stream, Aldis Lamp, Edward Tudor, Radiotherapy and Khaled. But the winner of the Two Thousand Guineas was Happy Knight, a Colombo colt who had run only once before. Airborne, a gray by Precipitation, won both the Derby and St. Leger. Khaled, however finished second in the Two Thousand Guineas, as did Gulf Stream in the Derby; Radiotherapy was third in each of these races.

The One Thousand Guineas was won by King George's Hypericum, a daughter of Hyperion. Steady Aim won the Oaks for Sir Alfred Butt.

A wartime diet, coupled with the restricted paddock room necessitated by the ploughing-up program, left its inevitable mark upon the homebred runners, with the result that horses which came over from France met with an unprecedented run of success, particularly in the long-distance races. Thus, Marsyas II won the Queen Alexandra stakes at Ascot, the Goodwood and Doncaster cups, White Rose stakes, and Lowther stakes; Caracalla II won the Ascot gold cup; Priam II the Hardwicke stakes at Ascot; Ardan the Coronation cup at Epsom; Sovereign the very valuable King George VI stakes, a new race, more than 2 mi., in which he beat Airborne; Felix II the Jockey club cup; and finally the three-year-old Sayani defeated 33 others by a head in the Cambridgeshire, under 9st.-4lb., the highest weight ever carried to victory in this race.

The Middle Park stakes, the "Two-year-old Derby," was won by Princess Aly Khan's Saravan. Monsieur l'Amiral, the winner of the Cesarewitch, was also French-bred, though in English ownership. Amongst the best of the homebred stayers (apart from Airborne) were Reynard Volant, winner of both the Ascot and Goodwood stakes, Voluntary, Trimbush and Wily; these four, as well as the French horse Marsyas II were descendants of Son-in-Law. The Bug, a three-year-old by Signal Light, proved the best sprinter, winning all his five races. Of the younger horses, Tudor Minstrel remained unbeaten throughout the season, but he did not meet either Petition or Ranjit, his two most formidable rivals,

ETERNAL REWARD winning the \$102,250 American Derby at Washington park, Chicago, Ill., on Aug. 24, 1946. At 102-1 odds, he scored one of the great upsets in turf history

both of whom won four of their five races.

Gordon Richards was champion jockey in the 1946 season for the 19th time. H. Wragg, retiring after a long and distinguished career, rode for the last time in the Manchester November handicap and won on Las Vegas. (F. M. Pr.)

Horses. The decline in the number of horses and colts continued through 1946 at about the same rate as in earlier years. The steady increase in tractor power continued to force the horse off farms and out of cities. On Jan. 1, 1946, there were estimated to be 8,259,000 horses on farms compared with 8,841,000 in 1945 and 10,935,000 in 1939. The war emergency did not check but rather accelerated it since the loss from 1945 to 1946 was about twice that from 1939 to 1940. The release of 50,000,000 ac. from the production of feed for work animals which occurred previous to 1939 was increased by 5,000,000 ac. in 1940-45.

An outlet for the surplus horses developed in the relief shipments to Europe by the United Nations Relief and Rehabilitation administration. More than 150,000 mares were requisitioned for shipment to Europe and were expected to be shipped before the work was completed. Exports of horses on private accounts were 14,000 head in 1945 and 54,000 in the year ending June 30, 1946.

The value of horses per head continued to decline through 1946 notwithstanding the demand for export and slaughter. The Dec. 1945 average price was \$56.70 per head, in Oct. 1946 \$56.50 and in Dec. 1946 \$55.50. This was in contrast to the sharp rise in prices of all other farm animals. In 1918 horses and mules made up 26% of the animal units on farms but in 1946 less than 18%.

The slaughter of horses for meat continued at a high level—77,887 head in 1945 and about 65,000 head in 1946. Most of the meat for human consumption was exported by U.N.R.R.A. to Europe. The bulk of horsemeat produced in the United States was made into dog and other pet animal feeds. Retail shops for the sale of horsemeat were opened in New York during the period of severe meat shortage.

Mules.—The number of mules declined less rapidly than horses and on Jan. 1, 1946, there were estimated to be 3,196,000 head on farms compared with 3,405,000 a year earlier and 4,250,000 head in 1939. More than half of the mule population was in the southeastern states—Texas, Georgia and the Carolinas. Mississippi maintained its mule population, the Carolinas lost less than 3% and Texas 13% during 1945. The value of mules held firm and even advanced through 1946. The average value was estimated at \$96.10 per head in Dec. 1945, \$106.00 in Oct. 1946 and \$105.00 in Dec. 1946.

The mules were valued most highly in the Carolinas where the average on Jan. 1, 1946, was \$229 in North Carolina and \$217 in South Carolina compared with an average of less than \$100 for the northern states from New York westward to the mountain states. The army's uses for mules practically disappeared and the chief support of the market was the demand for export to eastern Europe where the mule was still a preferred farm power animal. Exports of mules by U.N.R.R.A. and other agencies were more than 4,500 in 1945 and 60,000 in 1946. (See also SHOWS.) (J. C. Ms.)

Horse Shows: see SHOWS.

Horticulture. European countries began readjusting their horticultural activities with the help of the United Nations Relief and Rehabilitation administration (U.N.R.R.A.) but met many obstacles. The Netherlands exported a large number of spring bulbs to the United States but shipping conditions caused a large proportion to reach their destination late, with corresponding losses. Visitors to the Nether-

THE RED HYBRID TEA ROSE RUBAIYAT which was the only rose to receive an All-America Rose award in 1946; the award committee designated it the All-America Rose Selection for 1947

lands reported a total lack of shade trees along the streets and roads, all having been cut down for fuel.

Denmark began growing orchids and other plants on a large scale, stock having been saved by using heat from peat fires.

Central European countries were worse off because of a lack of fertilizers, lack of manpower and attacks by grasshoppers. Locust pests appeared in Italy, Greece and other countries in unprecedented numbers, but the use of a new insecticide called gamm-exane promised better control in the future.

South America also had heavy losses from locusts. Argentina imported 4,000 lb. of DDT for distribution in infested areas.

The U.S.S.R. continued to develop citrus plantings and began experimenting with the Kazanlyk rose; which yields attar of roses. The U.S.S.R. also began planting a protective fence of trees and shrubs for about 1,000 mi.

Yugoslavia had smaller crop yields than were expected and potatoes intended for seed were used as food. U.N.R.R.A. distributed great quantities of vegetable seeds in Europe and in China, where 3,435,000 U.N.R.R.A. seed packages were delivered. People in China were found eating straw, weeds and the bark of trees.

In England conditions were somewhat improved but there was a great lack of fertilizer and insecticides. The country continued to grow and eat greatly increased quantities of potatoes, with the per capita consumption up 95%. Home-grown potatoes took the place of imported potatoes and other food formerly imported.

In the United States, the Oregon section had an increased apple crop, but in the east the yield of McIntosh apples was greatly reduced by a widespread blight. Similar losses were sustained by tomato growers from the worst blight in history, which ruined both commercial and amateur crops, greatly reducing the number of tomatoes available for canning.

Much anxiety was created by the spread of the Dutch elm disease in the eastern states and a disease known as *Phloem necrosis*, deadly to elm trees, in the Ohio river valley. The

use of DDT in fog-producing sprays gave promise against the Dutch elm disease by destroying the carriers. Dusting forest lands by plane went far toward controlling gypsy moths in the eastern states.

Maine grew more potatoes than found a market and many were lost through freezing, but the government subsidized them. Oregon and Washington had very large crops of potatoes and also of cranberries. Massachusetts' output of cranberries was very large and sold at high prices.

The grape-producing area in New York and northeast Pennsylvania was expanded 25% by the planting of 18,000,000 grape cuttings.

Shipping strikes delayed receipts of rotenone from Peru, which had become almost the only source for that commodity and which exports about 8,000,000 lb. annually. Cryolite stocks were low.

Seed production, especially on the west coast, was somewhat below the average. European countries began again to produce vegetable seeds, causing U.S. growers to expect a gradual falling off in demands from abroad. Bulb growers in the northwest apparently found no serious competition from European countries, in spite of increased imports.

Several important insecticides came onto the market and attracted wide attention, among them benzene hexachloride, which was offered as a certain means of controlling wireworms in the soil. Previously, there had been no adequate control for these pests, which sometimes ruin an entire field of potatoes and other root crops. A material known as DD, another new chemical, gave control of nematodes, which abound in the soil of some western and southern states, and in greenhouse soil. Experiments at Cornell university found fermate useful in the rose garden, especially in combination with sulphur, to give protection from blackspot and mildew. Sabadilla dust used experimentally was found the most effective remedy yet introduced for dealing with chinch bugs, which often ruin lawns. Also, it was found useful in controlling squash bugs. Rynania gave greater control of the European corn borer than any other remedy which had been introduced, but gave no results in combatting the corn earworm. Experiments showed that DDT and magnesium oxide in combination successfully protected stored seeds, especially beans, from attacks by weevils. DDT, used for the first time in many gardens, gave unusual protection from thrips on gladioli.

Weed killers under various trade names appeared in the market. 2,4-D, a synthetic hormone substance named 2,4-dichlorophenoxyacetic acid, caused certain weeds to grow so fast that they destroyed themselves. It was found successful in killing dandelions, plantain and chickweed in lawns.

The red, hybrid tea rose "Rubaiyat" was the only rose to be approved by the All-America Rose committee in 1946; it thus became the All-America rose selection for 1947.

The George Robert White medal of honour for 1946 was awarded by the Massachusetts Horticultural society to Dr. Elmer D. Merrill, retiring director of all of Harvard university's botanical and horticultural institutions. (See also BOTANY; VEGETABLES.) (E. I. F.)

Hospitalization Insurance: see INSURANCE.

Hospitals. Outstanding in the hospital world for 1946 were the final report of the Commission on Hospital Care and the passage of the Hospital Survey and Construction act by the 79th congress.

The Commission on Hospital Care was an independent commission headed by Dr. Thomas S. Gates, chairman of the University of Pennsylvania, assisted by representatives of pro-

fessional, industrial, public welfare, farm, labour and other consumer groups. This two-year study was financed by grants from three of the large foundations and carried out by a professional and technical staff under the direction of Dr. Arthur C. Bachmeyer, director, University of Chicago clinics.

The report finds a need for 195,000 additional general hospital beds and the replacement of 25% of the existing 503,000 existing general hospital beds due to obsolescence or other unsatisfactory conditions. It proposes larger, more comprehensive facilities and elimination of many small hospitals; outlines an integrated hospital system of complete medical centres in large communities, regional and district hospitals in intermediate areas, and smaller hospitals, medical and health centres in less populous and rural areas. It suggests methods for attracting physicians and skilled medical personnel to rural areas and for utilization of the services of specialists and consultants in these areas.

The Hospital Survey and Construction act (S. 191) was passed by the 79th congress and approved by the president on Aug. 13. The purpose of the act is to assist states (a) in surveying existing hospital facilities and potential needs and to develop programs for meeting such needs and (b) to construct public and other nonprofit hospitals in accordance with such programs and authorize the appropriation of \$3,000,000 for the purpose of making the above surveys. These funds were to be allotted to the several states on the basis of population but not to exceed 33⅓% of the total cost of such surveys. In order to become eligible for these funds, each state was to designate a state agency as the sole agency for carrying out the survey and devising the program.

Section 621 of the act authorized the appropriation of \$75,000,000 each year for five years to assist states in the construction of hospitals provided for in the approved state programs. It was provided that the funds should be allocated to the several states according to a formula based on the total population and average per capita income in such a manner that low-income states should receive larger per capita allotments than high-income states.

The provision of the act set the total number of beds provided in any state at not to exceed 4½ beds per 1,000 of population for general hospitals, 2½ beds for tuberculosis for each death from tuberculosis per year, 5 beds per 1,000 of population for mental patients, and 2 beds per 1,000 of population for chronic disease patients.

At the close of 1946, 41 states were in process of making the necessary surveys and formulating their state-wide programs, 5 had made preliminary surveys, and 2 were awaiting the meeting of their legislatures for enactment of the necessary enabling legislation.

Another development which promised to be of great importance in the financing of hospital operation was the adoption by the Veterans' administration of the principle of remunerating civilian hospitals for the care of veterans with acute service-connected disabilities on a so-called "reimbursable cost" basis. In view of the fact that the better service the hospital renders its patients, the more it costs the hospital, the formerly used flat rate system had a net effect of penalizing the hospital which gave the best care and rewarding the hospital which gave the poorest care. The entire formula for computing "reimbursable cost" had not been completed by the end of the year.

Hospitals continued to operate under overcrowded conditions due largely to lack of sufficient bed facilities but, in many cases, due to inability to secure sufficient nursing personnel to properly care for as many patients as might be accommodated in the physical facilities available. (See also VETERANS' ADMINISTRATION.)

Hotels. With no substantial reconversion problems to meet, the hotel industry might have been expected to make rapid progress toward a return to normal operating conditions in the year 1946. Unfortunately for the travelling public this did not occur. Rather, hotels and their patrons were increasingly plagued with difficulties akin to those experienced by the greater industry which hotels serve—transportation.

The primary trouble was a demand for accommodations which exceeded capacity everywhere. Travel reached new peaks, in spite of the fact that automobiles had scarcely begun to return to the highways. Long lines of waiting guests, their luggage stacked, were daily observed at every registration desk from coast to coast. A situation completely beyond the control of management developed, and standards of hotel service deteriorated to a degree that even wartime years did not witness.

Continuing emergency regulations, high house counts and shortages of every kind of replacement material and equipment restricted hotel maintenance to a point below the minimum requirement for proper upkeep of the properties. Personnel was continually scarce. Understaffed departments were helpless to meet the excessive demand upon every type of hotel service. Morale of employees was affected. There was much complaint of discourtesy.

A black market in hotel rooms rapidly became a nationwide problem. For this the travelling public itself was largely at fault. Bribes, or tips as they were sometimes euphemistically termed, were offered to hotel clerks in large amounts. The temptation in many cases became too much to resist. In one particular instance two clerks on night duty were offered a total of \$250 within three hours. There were stories of managers who succumbed to venality. Auditors reported that rooms were being withheld for bribes, and often some were left unsold while guests clamoured vainly for their confirmed reservations.

Hotel management was equally troubled in the conduct of restaurants. Food scarcities and rationing limited menus and handicapped intelligent planning. By midsummer policy changes of the Office of Price Administration often reversed without apparent reason except political expediency, skyrocketed prices and increased difficulties on every hand. Patrons of restaurants suddenly clamoured for beef when none was available.

Cooking equipment for replacement of apparatus, obsolete or worn out by overuse, was unobtainable. It was impossible to procure new silverware or china. Linen became threadbare. Patterns no longer matched. Maitre d'hôtels turned in desperation to stainless steel, to any substitute. Imperative renewals to the extent of millions of dollars were of necessity deferred until 1947, even 1948.

Tipping in overcrowded restaurants grew out of all proportion. Waiters in popular night clubs earned more than their superiors. All of it was take-home pay, since it was not a common practice to report tips as income for tax purposes. Late in 1946 the internal revenue bureau launched a campaign to estimate annual tip income of service employees for taxation, but no method of computation had been agreed upon by the year's end.

For the first time recognition was given to the difference in earnings between tip and nontip employees, and allowance was made for this difference in wage adjustments. Hotels, completely unionized, found themselves faced with wage demands beyond their capacity to pay. There were hotel strikes in New York, Washington, Pittsburgh and Los Angeles. The ratio of pay roll

LAKE STEAMER "City of Grand Rapids," which accepted transient overnight guests during excursion cruises during the late summer of 1946 to relieve a critical shortage of hotel accommodations in Chicago

to receipts became a threat to the solvency of the industry. In a large Chicago hotel monthly pay checks totalled \$225,000 against monthly room rental revenues of \$200,000. For each dollar of hotel income as much as 50 cents went to the employees.

With mounting expenses and frozen ceiling charges only abnormally high room demand saved hotels from financial disaster. National accounting firms reported the unprecedented rate of 96% room usage for the 12 months, a figure impossible to maintain. The "break even" point of occupancy percentage rose from the old figure of 66% to 85%.

In spite of chaotic conditions the great hotel chains expanded. Hilton, Kirkeby, Sheraton and others acquired control of additional hotels. It was significant that these chains contented themselves with the acquisition of hotels already built. Even gossip about construction of new hotels subsided. Estimated cost of a modern hotel of the steel frame type rose to \$15,000 a room, completed. The Statler company announced that it would build a 1,400-room hotel in Los Angeles, but this plan was abandoned, at least temporarily, when it was discovered that a minimum room charge of \$8.80 per day would be necessary to yield even a moderate return upon the investment.

In the summer of 1946 a situation of utmost gravity to management and patronage alike developed. In June an early morning fire swept the Hotel LaSalle in Chicago, long considered to be of the highest type of so-called fireproof design. Sixty-one deaths resulted, with many more injured, and the hotel was so badly damaged that it was unable to open by the end of the year. A wave of hotel fires followed. In Dubuque, Ia., the Canfield hotel burned with 19 fatalities. Then in December the most disastrous conflagration in the history of hotel enterprise gutted the Wincoff in Atlanta, Ga. Fire regulations in that city did not require buildings to be equipped with fire es-

capas and more than half the residents of the hotel died or were injured in the catastrophe.

Hotel executives, who had relied, perhaps too complacently, upon the false assurance of the phrase "fireproof" were forced to revise their conception of fire safeguard. The immense increase in the use of cigarettes had more than doubled the fire hazard. Warnings were posted, urging greater care in the disposal of burning cigarettes since every lighted cigarette was a potential fuse. Realistic studies revealed that stair wells and elevator shafts became flues which permitted the rise of hot and poisonous gases, as well as flames, with unbelievable rapidity. A reappraisal of fire danger resulted, with enactment of new regulations in municipal and state codes.

Thoughtful managers went beyond these requirements. Doubled inspection, rapid disposal of combustibles, installation of safety equipment of every character, structural changes to enclose stair and other vertical openings, sprinkler systems, not demanded by law and other measures were taken to combat this increasing menace.

At the end of 1946 the beginning of a decline in travel as well as in patronage of night clubs and amusement restaurants became discernible. Lowest occupancies in the history of hotel operation in ten years were recorded in the Christmas period. Hotel proprietors and directors were once again faced with the problem of revising policies to meet decreasing receipts and rising operating costs.

(E. By.)

Housing. Housing continued to be a problem of the greatest urgency in 1946. Returning veterans demanded homes. A department of labour survey of 197 cities published in May 1946 showed that only 6 cities did not have an acute housing shortage. The materials output, hampered by reconversion problems and by strikes, could not satisfy all housing, industrial and commercial requirements.

Wilson W. Wyatt, expeditor and administrator of the National Housing agency, set a goal of 2,700,000 homes for the Veterans' Emergency Housing program for 1946 and 1947. For 1946, he set a goal of 1,200,000 homes started, of which 700,000 would be conventionally built homes, 250,000 permanent prefabricated and assembled on site from prefabricated parts, 250,000 temporaries (200,000 would be war-built temporaries moved to other sites and 50,000 would be new trailers). For 1947, he set 1,500,000 starts of which 900,000 would be conventionally built homes, 600,000 permanent prefabricated and assembled on site from prefabricated parts. According to estimates this would leave 3,916,000 families doubled up and, therefore, there would still be a need for 1,958,000 units. This estimate did not take into account the need to replace existing substandard units.

To accomplish this goal Wyatt did the following: (1) on Jan. 15, 1946, returned 18 scarce building materials to priority ratings (by Nov. 1 there were 66 materials on the priority list); (2) promulgated on March 26, 1946, Veterans' Housing Order No. 1 placing limitations on con-

CECIL JENSEN of the *Chicago Daily News* drew a pessimistic picture of the plight of the veteran looking for a home in 1946, in this cartoon "Golden Wedding Celebration"

struction competing for materials with housing. Builders of commercial and industrial construction were required to apply to local Civilian Production administration committees for permission to proceed. The committees were to screen out nonessential construction. But interest in local industrial and commercial advancement worked against curtailment. On May 9, 1946, CPA tightened its order, but by that time a huge amount of non-housing construction was under way. There was, however, a sharp decline in new approvals. In the week ending April 25, the dollar volume of approvals had been \$230,000,000; in the week of June 14, the dollar volume of approvals was only \$36,000,000. Further

restrictions upon commercial, industrial and public construction were made in Aug. and Sept. Nonresidential construction was reduced to \$155,000,000 in Aug. and in Sept. to \$115,000,000. (3) Because the veterans' demand was for moderate and low cost homes, priorities issued after March 26, 1946, were issued to veterans and to builders for homes costing no more than \$10,000 or renting for no more than \$80 a month. (4) In an attempt to minimize faulty construction NHA required (June 1946) all builders (except veterans building for their own occupancy) to submit detailed plans and specifications to be checked against Federal Housing administration standards and had FHA make two inspections of new construction (one at roughing-in and one at completion). (5) In order to hasten construction, the president and the housing expediter asked congress for certain aids on Feb. 7, 1946. On May 22 congress passed the Veterans' Emergency Housing act. It gave emergency powers to the housing expediter and provided \$400,000,000 for premium payments for scarce materials and market guarantees for new materials and for factory-built houses. It authorized up to \$2,000,000,000 for a continuation of the war-born Title VI FHA guarantee provisions of 90% mortgages on home loans by private lending institutions. This legislation, coming late in the first half of 1946, had no effect upon building in that period. The first premium payment arrangement was announced on June 19 and the first guaranteed market contract on Oct. 19. (6) The expediter urged the passage of the Wagner-Elender-Taft (W-E-T) bill cited as the "General Housing Act of 1945" which was introduced in congress on Oct. 29, 1945. It passed the senate in 1946 but died in committee in the house. A separate attempt to create a permanent National Housing agency through the president's authority to reorganize executive departments was rejected by both houses.

For the 1,200,000 goal of permanent and temporary homes set for 1946, more than 800,000 starts were made in the first 9 months.

In terms of houses ready for occupancy the Veterans' Housing program got a slow start.

Costs rose. The spiral continued upward month by month.

Table III.—Average Percentage Increases in Prices of Homes and Home Sites:

Sept. 1945 to Feb. 1946

	HOMES		HOME SITES		
	Under \$6,000	\$6,000-12,000	Raw Land	lots	H-2 Houses Above Ceilings

Cities under 100,000	17.8	14.6	21.8	22.4	30.7

Source: NHA report.

The greatest lack was in the production of new permanent rental units desired by the veteran who did not want to buy at inflated prices. There was practically no new construction for those of moderate or low income.

On Nov. 10, 1946, building materials were released from Office of Price Administration control. The president requested Wyatt to present a new housing program. When it was presented, the president disagreed. Wilson Wyatt resigned on Dec. 4, 1946. The president, in accepting the resignation, praised his accomplishments but stated that the housing program must now be adapted to "the government's announced policy of relaxing controls." On Dec. 12, the president appointed Raymond M. Foley, commissioner of FHA, as administrator of NHA and Frank Creedon as housing expediter, separating the two offices which Wilson Wyatt had held. On Dec. 14, the president issued a new housing program emphasizing the need to stimulate rental housing and the policy of relaxing controls. He announced the discontinuance of the priority rating system for builders; a gradual relaxation of the nonhousing construction order; relax-

ation of the veterans' preference order insofar as persons building homes for personal occupancy were concerned; authorization of housing construction by federal permits issued on the basis of year-round occupancy, restricted floor footage (no price ceiling on sale housing), and, in the case of rental housing, maximum rents averaging not more than \$80 per unit per project; continuance of premium payment and guaranteed market programs; studies which would promptly lead to recommendations for legislation for federally-aided housing for low income groups. BIBLIOGRAPHY.—Reports of the National Housing agency, Federal Housing administration, Federal Home Loan Bank administration, Federal Public Housing authority, the Bureau of Labour statistics, the Department of Commerce, the National Committee on Housing; *Architectural Forum*; F. W. Dodge corporation. (D. R.N.)

Federal Home Loan Bank Administration.—The Federal Home Loan Bank administration directs the operations of the Federal Home Loan Bank system and the Federal Savings and Loan Insurance corporation—two permanent, self-supporting agencies, established to encourage home ownership and economical home financing and to protect savings. The administration supervises federal savings and loan associations. FHLBA also directs the Home Owners' Loan corporation, which was in liquidation during 1946.

Federal Home Loan Bank System.—Established in 1932, the Federal Home Loan Bank system provides a nation-wide home mortgage credit reserve for thrift and home-financing institutions. During 1946 11 regional Federal Home Loan Banks served member home-financing institutions in their respective areas by making short-term and long-term loans to them. From the time they were created, they had advanced \$1,925,115,719 to their member institutions, of which \$258,443,608 was outstanding on Nov. 30, 1946.

Of the 3,696 member institutions of the system at the end of the year, 3,659 were savings and loan associations, co-operative banks and home-stead associations; 25 were mutual savings banks and 12 were insurance companies. Assets of members amounted to approximately \$10,000,000,000.

Federal Savings and Loan Associations.—Chartered and supervised by the Federal Home Loan Bank administration, federal savings and loan associations are locally operated home-financing institutions, either newly-organized after they were authorized by congress in 1933 or converted from state charter. On Nov. 30, 1946, there were 1,471 federal associations in operation with combined assets of \$4,580,000,000.

Federal Savings and Loan Insurance Corporation.—In 1946, about 4,900,000 investors in 2,495 savings and loan associations were protected up to \$5,000 each by the Federal Savings and Loan Insurance corporation, created in 1934. Insurance is mandatory for federal associations, optional for state associations.

Home Owners' Loan Corporation.—From 1933 to 1936 the HOLC refinanced delinquent mortgages on more than 1,000,000 homes by providing low-interest, long-term loans, which in the meanwhile have enabled most owners to retain their properties. In these rescue operations, \$3,093,000,000 was loaned, an amount later increased to nearly

"RHODY VET ROW" was named by the student veterans who occupied this block of Quonset huts on the Rhode Island State college campus in 1946; each hut accommodated 11 students

PREFABRICATED HOUSES on the University of Chicago campus which were occupied by married veteran students and their families in 1946

\$3,500,000,000 through advances to borrowers and other costs.

Up to Oct. 31, 1946, about 81% of this investment had been liquidated. When liquidation was completed, the corporation expected to return to the U.S. treasury its \$200,000,000 of original capital, plus a moderate return.

Federal Housing Administration.—The Federal Housing administration was established in June 1934 by the National Housing act "to encourage improvement in housing standards and conditions, to create a sound mortgage market, and to provide a system of mutual mortgage insurance."

Under the Veterans' Emergency Housing program, the FHA is the operating constituent of the NHA which processes and issues priorities on materials for housing for veterans. It also insures home loans which meet FHA conditions.

The FHA does not lend money but insures residential mortgage loans made by private lending institutions and also insures lenders on property improvement loans. The maximum interest rate, under Title II of the National Housing act, is 4½% plus the FHA insurance premium of one-half of 1%, both calculated on annual outstanding balances.

In peacetime, FHA insurance normally is governed by Titles I and II of the National Housing act. Title VI was added as a defense war measure.

Title I provides for FHA insurance of qualified financial institutions on loans for property improvements, alterations and repairs. Although loans for those purposes ordinarily are limited to a maximum amount of \$2,500 and a maximum term of 3 years, loans up to \$5,000 for terms up to 7 years are insurable if the funds go to provide additional housing accommodations for veterans. Title I loans are repayable in monthly installments.

Title II provides for insurance of mortgage loans ranging up to \$16,000 made by approved lending institutions. All loans are amortized in monthly payments and under certain circumstances may be repaid over periods of as long as 25 years.

Title VI was added to the National Housing act specifically to assist in providing housing for defense and war workers. A separate Housing Insurance fund, nonmutual in character, was established. FHA temporarily stopped taking applications for Title VI loans in Sept. 1945 when its authorization was virtually used up, but such insurance was resumed in May 1946 upon the approval of the Veterans' Emergency Housing act.

Mortgages insured under Title VI are limited to a maximum of \$5,400 on a single family house; \$7,500 on a two-family house; \$9,500 on a three-family house; and \$12,000 on a four-family house. Insured loans may cover up to 90% of necessary current costs. In areas where builders cannot provide sound standards of construction, design or livability within these limits, the federal housing commissioner may permit maximum mortgage amounts up to \$8,100 on a single family house; \$12,500 on a two-family house; \$15,750 on a three-family house; and \$18,000 on a four-family house.

Title VI authorizes FHA also to insure mortgages on large-scale rental projects for a maximum of 90% of FHA cost estimates.

Before FHA resumed Title VI insurance in May 1946 with a total insurance authorization of \$1,800,000,000, it had insured loans for approximately 450,000 dwelling units for war workers. Amendments permit FHA to issue additional insurance up to \$1,000,000,000 for housing for veterans and members of the armed forces. This may be increased with the approval of the president by an additional \$1,000,000,000.

By the end of 1946, the long-term program of the FHA had enabled more than 1,760,000 families to build, purchase or refinance their homes or to rent modern quarters. FHA insurance written under Title II

amounted to more than \$5,442,000,000 as of Nov. 30, and FHA-insured property improvement loans under Title I exceeded 6,064,000 in number and aggregated \$2,427,000,000.

In addition to being self-supporting, the FHA was able, under the participation provisions of the Mutual Mortgage Insurance fund, to declare on certain groups of mortgages 41,000 dividends through March 31, 1946. By Jan. 1, 1946, equity balances had accumulated in a total of 81 groups. Dividends would be received eventually by approximately 226,000 mortgagors who still remained in these groups on that date.

Federal Public Housing Authority.—The Federal Public Housing authority has responsibility for federally-financed public housing functions. At the beginning of 1946, the FPFA had four principal assignments:

1. To provide federal aids for low-rent housing built before the war, or deferred because of the war, and to convert war housing under the U.S. Housing act to low-rent status.

The U.S. housing act program provides public housing for low-income families formerly living in slum dwellings. Administration of this program, in co-operation with local housing authorities, is FPFA's basic and long-run job. Projects are financed with loans from the FPFA or private investors. All loans are being repaid in full, with interest, in accordance with established amortization plans. To help keep rents within the means of low-income families, the FPFA and the community make annual contributions.

As of Nov. 1, 1946, the total housing built or authorized under the U.S. Housing act comprised 193,522 dwellings in 747 projects. This total included some 21,000 low-rent units on which construction had been deferred pending availability of labour and materials.

2. To provide emergency temporary housing for veterans, in co-operation with schools and other local bodies by re-using any surplus war housing on hand, plus barracks and quonset huts.

Congress appropriated \$445,000,000 to pay the federal costs of relocation and remodelling, and in the same legislation authorized FPFA to transfer additional temporary structures to local bodies for remodelling at their expense. Including units on which local bodies were bearing all expenses, the temporary re-use program was expected to provide about 250,000 dwelling accommodations for veterans.

3. To manage public war housing during the period of reconversion and demobilization for distressed families of veterans and servicemen, for certain civilian employees of the war and navy departments and of private industries completing war contracts and for distressed families dislocated as a result of the war or demobilization.

The major wartime function of FPFA was to provide some 700,000 housing units—about four-fifths of all publicly financed war housing—for in-migrant war workers and their families. Most of this housing remained in the total housing supply, and would be managed by FPFA until disposed of.

In addition to veterans accommodated by the re-use of surplus facilities, on Nov. 1, 1946, about 272,000 veterans' and servicemen's families were living in public housing remaining at its wartime location. Such families accounted for more than 44% of all occupied war and low-rent housing units in programs administered by the FPFA.

4. To dispose of federally-owned housing as it becomes surplus. On Nov. 1, the FPFA still had about 517,000 units to dispose of when they become surplus to veterans' and other demobilization needs. Within the requirements of law and sound housing policy, housing would be disposed of in ways consistent with local plans. Most of the stock consisted of 249,000 temporary units, which must be removed from the site within 2 years after the emergency; and 169,000 units to be sold for permanent residential use.

In addition to these assignments, other FPFA housing included: (a) 50 projects built by the Public Works administration and operated as low-rent housing; (b) 30 subsistence homesteads projects, which were transferred from Farm Security administration and were being disposed of; (c) 3 greenbelt towns which were transferred to FPFA in 1942 for management and eventual disposition; and (d) mortgages on 3 limited dividend projects constructed by private corporations with the aid of government loans.

(H. F. V.)

Great Britain.—At the end of World War II, 4,000,000 new houses were needed in Great Britain within ten years; precisely that number had been destroyed or damaged by enemy action during the war. In addition, housing was urgently needed to provide accommodation for those living in overcrowded conditions, to accommodate all the young couples who had married since the war and to allow for the increased number of families. The Labour government adopted two main policies: the creation of temporary prefabricated houses as a short-term measure, for which no further contracts would be made after Dec. 31, 1946, and the construction of permanent standard houses of the size 950 sq.ft. floor area and more, recommended by the Dudley report. The government decided that houses should be built for letting at rents that the working classes could afford, and that houses built for selling should be in the proportion of one house for sale to four houses to let. By the end of 1946, 96,000 temporary houses and some 20,000 permanent houses had been constructed, while a further 100,000 houses had been provided by the reconstruction of war-damaged property.

In the late summer of 1946 large numbers of families, discontented with the slowness of the housing program, took forcible possession of unoccupied service camps with the general

sympathy of the community. When they extended their activities to unoccupied dwelling houses, blocks of flats and hotels, public sympathy evaporated and the government took all legal action necessary to restrain the "squatters."

There were many bottlenecks in materials and in fittings. The shortage of steel was most marked, but there were other shortages of such materials as asbestos and wood-wool which caused delay. The building industry was, however, rapidly mobilized; building workers were given special opportunities of early release from the forces, and by the middle of the year there was a larger labour force employed in house building than at any previous time in British history. This fact was reflected not so much in the number of houses actually constructed as in the number of sites acquired by local authorities and the number of sites which were in actual course of preparation. By the end of 1946 the number of sites acquired by local authorities amounted to 700,000 while the number of sites under active preparation was 300,000.

Rents tribunals, with power to reduce rents, were set up in London and elsewhere to hear complaints of excessively-rented furnished accommodation.

Europe.—The U.S.S.R. began the task of rebuilding the wrecked houses in formerly occupied regions with great energy. The government allocated the sum of 42,300,000,000 roubles for the period 1946–50, as against a previous expenditure of 15,500,000,000 roubles in the period of the third Five Year plan. The aim was to build 72,400,000 sq.m. of living space in the five-year period, with an additional 12,000,000 sq.m. to be built by individual owners aided by government loans. Partly in order to avoid a high labour turnover, business organizations were encouraged to provide blocks of one-family and two-family houses with gardens and vegetable plots to be sold on the instalment system to workers, clerks, technicians and engineers.

A vigorous attack was also being made on the rural housing problem, and loans to collective farms and to peasants for the next five-year period provided for a total of 3,400,000 houses.

Sweden proceeded steadily with a rehousing program particularly notable for the high standard of architectural design. The number of houses and flats built during 1946 was approximately 45,000 in the urban areas.

In the British zone in Germany the work on the reconstruction of damaged houses was concentrated on those houses which had been damaged up to 60%. A modest program for the construction of miners' houses was planned but the only houses erected in 1946 were for testing experimental forms of construction. (G. McA.)

Humbert (1904–), prince of Piedmont, was born Sept. 15, the son of Victor Emmanuel III. His education emphasized military arts and sciences and included a period at the Royal Military academy in Turin. In 1930 Humbert married Princess Marie José, daughter of King Albert of Belgium. In 1940 he was placed in command of Italy's army of the Alps, with the rank of full general. On June 5, 1944, Humbert was designated lieutenant general of the realm when Victor Emmanuel signed over to him all his royal powers without exception, retaining for himself only the designation "King of Italy and

head of the house of Savoy." The prince was backed by a political party drawn largely from aristocratic families and military and naval officers.

After the abdication of Victor Emmanuel III, Humbert assumed the throne, May 9, 1946, as King Humbert II. However, following the elections of June 2, in which the Italian people voted in favour of a republic, Humbert went into exile, June 13, after a rule of only 35 days.

Hungary. A republic in central Europe. Area 35,911 sq.mi.; pop. (Dec. 1936) 8,989,000. The majority of the population is Roman Catholic but there is a large Protestant, and there was a considerable Jewish, minority. Capital: Budapest. Chief cities (pop. 1939): Budapest (1,115,877); Szeged (141,254); Debrecen (128,442); Kecskemét (83,837). President: Zoltan Tildy; prime minister (1946): Ferenc Nagy.

History.—The elections on Nov. 4, 1945, had resulted in a sweeping victory for the Small Landowners party. The chairman of the party became prime minister. His cabinet, however, represented a coalition in which the Communists, though they had received only 17% of the votes, held decisive key positions. At the same time they dominated the all-important supreme economic council. The leading representative of the Communist party in the cabinet was vice-premier Matthew Rakosi, in the supreme economic council, Zoltan Vas.

On Feb. 1, 1946, the national assembly proclaimed the end of the 1,000-year-old Hungarian monarchy. Hungary had been a republic before for two short-lived periods in 1848 under Lajos Kossuth and in 1918 under Count Michael Károlyi. Now Zoltan Tildy was elected president of the Third Hungarian republic for a four-year term. The majority party, the Small Landowners, suggested Deszö Sulyok as prime minister but as a result of Communist opposition another member of the party was elected premier. On Feb. 4, Ferenc Nagy. The party was forced one month later under Communist pressure to expel 20 "reactionary" members who under the leadership of Deszö Sulyok formed a new party called the Kossuth party. The ministry of the interior, which controls the very active secret police, remained in Communist hands when Imre Nagy was replaced by Ladislaus Rajk.

The main effort of the government was directed toward

PEOPLE OF BUDAPEST, Hungary, seeking to get in, or on, a train for a ride to the country where they could search for food, which was exceedingly scarce in their city during 1946

stemming the economic chaos and at the same time toward preserving some economic independence from Russia. Russia had successfully established economic control over the two most important natural resources of Hungary, oil and bauxite, and acquired controlling shares in Hungary's transportation, especially the navigation of the Danube and the air lines, and in Hungary's leading financial and credit institutions.

The Hungarian economic crisis was aggravated by the payment of reparations to Russia, which carried heavy penalties for any arrears in payment. The Russian government agreed to extend the period of reparations payments from six to eight years. The U.S. government complained in several notes, of which the most important was that of July 23, that the Russian government refused to honour its agreement at the Yalta conference to concert the policies of the Big Three governments in assisting the peoples of the former axis satellites to solve by democratic means their pressing political and economic problems. The note requested that the soviet chairman of the Allied Control commission in Hungary be asked to co-operate so that the economic disintegration of Hungary might be halted. The United States at the beginning of the year had granted a loan of \$10,000,000 to Hungary and U.N.R.R.A. relief had been a great help to the country. To assist in the stabilization of Hungary's currency, the U.S. government turned over to Hungary \$32,000,000 of Hungarian gold reserves held in Germany.

The tremendous inflation in Hungary brought the country to the brink of catastrophe. The value of the pengő, which normally was 20 cents, had dwindled by May 14 so much that the dollar reached the fantastic value of 2,500,000,000 pengős. On that day a new bank note of 1,000,000,000 pengős went into circulation, after a 100,000,000 pengő note was issued on April 29. This dizzying process of inflation crippled the whole national economy. In a desperate effort to check this development, the government worked out a plan for a severe deflation. On Aug. 1 a new currency was introduced. Its unit, the forint, represented 0.0757 grams of fine gold. The official dollar exchange rate was fixed as 11.7393 forint to one dollar. The strict deflation process brought about an economy of sharp economic restriction. On Dec. 10 the first Hungarian budget after 1943 was announced in the parliament. It called for an expenditure of 4,420,700,000 forint (roughly \$376,000,000), against an estimated income of 4,045,000,000 forint.

The Small Landowners party was determined to establish the new Hungary on the prosperity of the small independent farmer class. The second land reform by its redistribution of land created some 400,000 new proprietors with holdings of 7 to 13 ac. who were added to a similar number holding from 25 to 50 ac. The party drew up a program for them to engage in intensive types of agriculture and modern poultry and dairy methods. These quality food products could be exported to western and central Europe in return for manufactured goods. Agricultural co-operative societies after the Scandinavian model were to help in the development of this new independent farm class which would represent a bulwark for democracy.

The Russian occupation forces and the Hungarian Communists conducted a sharp campaign against a number of Catholic youth organizations and against the Boy Scouts. The resignation of a number of leading members and journalists of the Small Landowners party, of a number of non-Marxist prefects, and a general purge of the political life were demanded categorically at the end of June. A renewed wave of arrests on political charges was carried through, among them personalities who had had a clean record of opposition to the Germans. The Hungarian government complied and dissolved the Boy Scouts, the Catholic youth groups, an organization similar to the Y.M.C.A., and a student union. The Small Landowners party replaced the

entire management of its own youth organization. The government also called upon the Catholic priesthood to refrain from all anti-Communist or political activities.

A number of former prime ministers and ministers of the Hungarian governments favourable to Germany were executed by sentences of the people's court. Among them were Ferenc Szalasi, Bela Imredy, Laszlo Bardossy and Doeme Sztójay.

At the Paris peace conference in Oct. 1946 the peace treaty with Hungary was elaborated. The U.S. delegation attempted to reduce the amount of reparations payable by Hungary from \$300,000,000 to \$200,000,000, but was not successful. Concerning the amount of compensation which Hungary must pay for damage to Allied property, the French proposal for a 75% compensation was accepted. The difficult problem of population transfer between Czechoslovakia and Hungary was settled by compromise according to which Hungary should enter into bilateral negotiations with Czechoslovakia in order to solve the problem of those inhabitants of Magyar ethnic origin residing in Czechoslovakia who would not be settled in Hungary within the scope of the treaty of Feb. 27, 1946, on the exchange of population between the two countries. Should no agreement be reached within a period of six months after the coming into force of the Hungarian peace treaty, Czechoslovakia should have the right to bring the matter before the council of foreign ministers.

(H. Ko.)

Finance.—The monetary unit is the forint, formerly the pengő, containing 0.0757 grams of fine gold. The official exchange rate in 1946 was 11.7393 forint to one U.S. dollar. The revenue for 1944 was \$196,000, expenditure \$205,000. Gold reserves were \$3,000 and the national debt was \$217,000. Values were computed on the basis of the 1945 value of the pengő (30,000 pengős=\$1).

Transportation and Communication.—Hungary had in 1945, 4,848 mi. of railroads, 15,159 mi. of highways and 1,222 mi. of waterways. There were 39,618 telephones, 6,214 mi. of telegraph lines and 178,319 radio sets. All these figures were preliminary.

Trade.—The principal items of export and import for 1944 were as follows:

Exports			Imports		
	\$	Tons		\$	Tons
Wheat	686	60,676	Timber and wood . .	559	135,966
Livestock	1,000	56,000	Raw metals	976	10,207
Poultry	186	9,000	Raw cotton	300	1,183
Electrical machinery and apparatus . .	404	...	Paper and manufactures . . .	2,000	97,696

(1945 value of pengő used)

Nearly all of the trade was carried on with Germany.

Agriculture, Manufacturing, Mineral Production.—In 1943 mineral production was as follows: lignite, 11,892,274 tons; coal, 1,513,017 tons; bauxite, 1,099,544 tons; iron ore, 377,428 tons. The 1945 crops included: turnips, 1,804,729 tons; wheat, 725,095 tons; corn, 2,062,566 tons; potatoes, 1,863,761 tons; sugar beets, 195,642 tons. Livestock for the same year numbered: swine, 1,145,504; cattle, 1,008,700; sheep, 311,152; horses, 368,844. The value of manufactures for 1943, based on the 1945 value of the pengő, was: food, \$73,000; textiles, \$41,000; metals, \$28,000; machinery, \$57,000. (See also RUMANIA.)

Hunter College. Hunter College reopened its Bronx campus to students on Oct. 14, 1946. Previously (1943-45) this campus had served the United States navy as a training school for WAVES. Then (1946) it became the headquarters of the Security council of the United Nations. About 600 male veterans were admitted to a course of study in the liberal arts. The regular college curriculum was enlarged to include courses leading to the B.S. degree in music and home economics. New interdepartmental majors in liberal arts were introduced early in 1946. Library facilities in the Bronx buildings were being expanded considerably. More intensive use of the buildings on Park and Lexington avenues was made necessary by abnormally heavy enrolment. Offerings in the evening college and particularly in adult education were greatly increased, since the number of students was nearly twice as large as it was in 1939. Gifts and bequests during 1946 included the James Picker fund, the Clara Fischer fund and the Abbie W.

Nooney bequest, all designed to aid needy students. Other donations were received from the Altman foundation, the Littauer foundation and the Jewish Education association. Generous public support was also accorded the student activities conducted at Sara Delano Roosevelt Memorial house. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (G. N. S.)

Husseini, Haj Amin el (1900–), Arab politician and grand mufti of Jerusalem, was born in 1900 and educated at El Azhar university in Cairo. During World War I he served with Feisul al Husain at Damascus and gave lukewarm support to the Allied cause. Husseini was appointed grand mufti of Jerusalem by the British in 1921 and was one of the prime instigators of anti-Jewish disturbances in Palestine. He encouraged the violent Arab attacks on Jews in 1937, and in July of that year was forced to flee to the Lebanese republic. He went to Iraq after the outbreak of World War II and later made his way to Rome and Berlin, where he became an active anti-Semitic propagandist and broadcast anti-Jewish and anti-British propaganda over axis radio channels to the middle east.

The mufti again became a fugitive after the collapse of Germany and in May 1945 crossed into Switzerland. Denied refuge by the Swiss, he was deported to France, but turned up in Alexandria, Egypt, on June 20 where he was given sanctuary by King Farouk. Both the British and French governments were accused of collusion in the latest flight of Husseini although official spokesmen of both countries denied the charges. Shortly after his arrival in Egypt, the grand mufti was appointed spiritual head of the newly-created Palestine committee formed by the anti-Zionist Arab league.

Hutchins, Robert Maynard (1899–), U.S. educator, was born Jan. 17 in Brooklyn, N.Y. His father, William James Hutchins (1871–), minister and theologian, was subsequently president of Berea college in Kentucky. Hutchins left Oberlin college, Oberlin, O., in 1917 to enlist in the U.S. ambulance corps, winning the *Croce di Guerra* in action with the Italian army. Entering Yale university, New Haven, Conn., in 1919, he received his A.B. in 1921 and his LL.B. (*magna cum laude*) in 1925, subsequently receiving honorary degrees from many colleges and universities. In 1923 he was appointed secretary of Yale university and in 1927 dean of its law school. In 1929, at the age of 30, he became the fifth president of the University of Chicago, where his reforms and proposals for reform made him one of the best known and most controversial figures in the history of American education.

In 1946, with his famous "Chicago plan" in full operation and the university relieved of its wartime training and research, Hutchins, having resigned the presidency and taken the post of chancellor the year before, took a year's leave of absence to be chairman of the board of editors of *Encyclopædia Britannica*, Inc. Announcing his intention to devote himself to the spread of adult education through the reading and discussion of the "great books," Hutchins declared: "The world may not last long enough for the restricted campus education of today to affect the course of events. If there is a choice to be made between youth and adult education, then the urgency of our time gives priority to the adult." Prior to his assumption of full-time duties with the *Britannica*, Hutchins was chairman of the executive committee of its board of directors, a director of *Encyclopædia Britannica Films Inc.*, and editor-in-chief of a set of

the "great books" scheduled for publication by the *Britannica* in 1948.

His university activities in 1946 included the consolidation of his college reforms in the Chicago four-year liberal arts curriculum beginning with the usual junior year in high school. He also established on the campus the Institute of Nuclear Studies and the Institute of Biophysics, for research in the physical and biological adaptations of atomic energy. Although he opposed the entrance of the United States into the war in 1940 and 1941, the University of Chicago, under his administration, played a central role in the development of the atomic bomb.

In 1946 he also campaigned, in speeches and writings, for international civilian control of atomic energy and against peacetime military conscription. Calling for immediate world organization and the abandonment of national sovereignty as the only hope of saving civilization from atomic destruction, he accepted the chairmanship of the Committee to Frame a World Constitution. (M. S. MR.)

Hygiene, Industrial: see INDUSTRIAL HEALTH.

Ibn-Sa'ud (1880?–), king of Saudi Arabia, was born about 1880 in Riyadh, the son of 'Abd-al-Rahmān, leader of the Wahabi sect of Arabs. Ibn-Sa'ud was christened 'Abd-al-'Azīz Ibn-'Abd-al-Rahmān Ibn-Faisal Ibn-Sa'ud. For his early history, see *Encyclopædia Britannica*.

In 1933, Ibn-Sa'ud granted concessions for exploitation of his oil-rich lands to the Standard Oil Co. of California and later gave similar privileges to the Texas Co. The rentals from these leases made him independently wealthy.

Ibn-Sa'ud was neutral during World War II, although he favoured the British. He later endorsed the pan-Arab stand in the controversy over establishment of a Jewish homeland in Palestine.

He journeyed to Cairo in Jan. 1946 for a conference with King Farouk and the two monarchs jointly declared that "Palestine must remain an Arab country." Ibn-Sa'ud (May 6, 1946) branded the United States-British inquiry commission's report recommending the admission of 100,000 Jews into Palestine as "an injustice without precedent." He criticized Pres. Harry S. Truman's appeal for admission of more Jewish immigrants into Palestine and declared in a letter to the president on Oct. 17, 1946, that his statement was in complete contradiction to a presidential assurance to the Arabs and violated previous promises made to them.

ICC: see INTERSTATE COMMERCE COMMISSION.

Ice Cream. The total 1946 ice cream production was estimated by the U.S. department of agriculture at about 750,000,000 gal., the largest on record, compared with 471,265,000 gal. in 1945 and an average of 315,126,000 gal. 1937–41. During the first seven months of 1946 production was 84% more than the same period of 1945. This great increase followed the termination of the control on ice cream manufacture on Sept. 1, 1945. Only the shortage of sugar was restrictive. Fall production declined in 1946 through November which was only 7% more than the same month in 1945. The output of ice cream varied by months from 39,755,000 gal. in January, always the low month, to 99,190,000 gal. in July which usually is the high month. The states of highest production were, in order of output, Pennsylvania, New York, Ohio, Illinois and California. Per capita consumption in prewar years was about 10 lb., then rose to 15 lb. in 1945 and nearly 20 lb. in 1946. Supplies for civilians were short early in 1946 but became easier in the fall. The smaller supplies needed for the armed forces eased the

general supply situation. The output of sherbets and other frozen dairy foods declined as plenty of ice cream became available. The sugar used in these substitutes for ice cream was shifted to the latter when control ceased. (J. C. Ms.)

Ice Hockey. Les Canadiens de Montreal came back into their own as the double kings of hockey, winning the National league championship and going on to corner the Stanley cup and the world championship which went with it. Montreal won the regular league campaign by five points, humbled the Chicago Blackhawks in four straight semifinal cup games and won the Stanley trophy with four out of five victories over Boston.

The seasoned line of Maurice Richard, Elmer Lach and Toe Blake once again led the Canadiens, in league as well as cup competition. In 9 Stanley cup games the Canadian No. 1 line scored 19 goals and had 22 assists. During league action the Richard-Lach-Blake combination led all scoring units with 69 goals. Of equal importance to the Montreal victory was the goal-tending of Bill Durnan, who won his third straight Vezina trophy as hockey's leading goalie. Durnan allowed 104 goals in 40 games and scored 4 shutouts.

Hockey established a new attendance record during 1945-46 when more than 2,000,000 fans witnessed the 150 league games. The Chicago stadium, home of the Blackhawks, led in attendance with 419,924 spectators for 25 home games, an average of 16,797. Chicago drew the largest hockey crowd in history when 18,475 witnessed a Hawk game with Montreal on Jan. 20. In 1944-45 Chicago drew 348,821 spectators for 25 dates.

The Dr. David A. Hart trophy, awarded to the player "most useful" to his team, went to Chicago's Max Bentley. Bentley was the league's leading scorer with 31 goals and 30 assists. Edgar Laprade, New York forward, was named the outstanding rookie of the year, while Montreal's Toe Blake won the Lady Byng trophy as the league's most gentlemanly player.

In the American league the Buffalo, N.Y., Bisons captured the championship for the third time in four years. Buffalo won the eastern division title and defeated the Cleveland Barons, 4 games to 3, in the final playoff. Kansas City, Mo., topped the U.S. hockey league and went on to defeat Tulsa, Okla., in the playoff finals, 4 games to 2.

For the third straight year, the Boston Olympics won the Eastern league championship, but lost to the Vancouver, B.C., Canucks, 4 games to 3, in the final of the Amateur Hockey association playoff. Vancouver won the northern division of the Pacific Coast league and toppled Portland, Ore., in the playoff windup. Yale and Dartmouth were tied for first in the Eastern Intercollegiate league.

The entire Chicago first line of Doug and Max Bentley and Bill Mosienko was placed on the National league managers' all-star team. Jack Stewart of Detroit and Ed Bouchard of Montreal were placed on defense, while Harry Lumley of Detroit and Durnan shared the goal-tending assignment. (M. P. W.)

Iceland. An island republic of the north Atlantic. Area, 39,709 sq.mi.; pop. (census 1940) 121,474; (est. 1945) 126,000. Capital, Reykjavik, the only large town (pop. 1945 est. 46,000). Religion, Lutheran Christian. President, Sveinn Björnsson. Prime minister, Olafur Thors (whose two-yr.-old coalition government resigned on Oct. 10, but continued to function on an interim basis).

History.—Iceland's chief problems in 1946 continued to stem from the fact that it was an innocent bystander in a world of tensions.

Government and people were struggling to reorient the economy to the new peacetime situation. During World War II the

United States had bought most of Iceland's fish and lend-leased them to Great Britain—90% of Iceland's exports went to Britain, while the United States supplied 65% of Iceland's imports. With the close of the war Britain ceased buying the fish, perhaps largely because of the high prices caused by Icelandic inflation. New markets had to be sought, and on May 27, 1946, Iceland signed a trade agreement in Moscow. A few months later a soviet trade delegation visited Iceland. It was authorized to purchase the entire fish catch and offered prices considerably more than war rates—about 30% higher on frozen fillets and 60% on herring oil. The U.S.S.R. also offered to sell Iceland all needed imports, such as coal, lumber, etc.

The United States had found Iceland important as a North Atlantic base for shipping and for flying. Long term privileges were therefore sought by the United States at Keflavik airport, developed by the U.S. during World War II. But the United States-Icelandic agreement provided for the withdrawal of U.S. soldiers as soon as the emergency was over. The soviet union repeatedly called attention to the continued presence of the soldiers of the United States in Iceland. The difficult negotiations were avoided by the Icelanders for some months, but an agreement was ready for the Althing in September. It provided for the withdrawal of all U.S. military personnel (already down from 45,000 to 1,000), but provided for special privileges at the Keflavik airport for U.S. planes en route to Germany for the duration of the U.S. occupation of Germany. The Icelandic Communists, who held 10 seats out of the 52 in the Althing and 2 places in the coalition cabinet, led a vicious attack against the treaty. In September a general strike protested its ratification, and when the Althing approved it (Oct. 5) by a vote of 32-19 the Communists withdrew support from the government (Oct. 10). The whole cabinet resigned, but Olafur Thors was asked to continue in office until a new government could be formed.

General elections on June 30 left the party line-up much as it had been—the Progressives lost two seats to the Social Democrats. The vote gave:

	Votes	Seats
Independence party	26,428	20
Progressive party	15,072	13
Communist party	13,049	10
Social Democratic party	11,911	9

Iceland clung to its neutral status and did not join the wartime United Nations. It was, however, among the first to apply for membership in the postwar United Nations organization, and on Nov. 9, 1946, it was officially admitted, along with Sweden and Afghanistan.

Finance.—Monetary unit: króna=18 U.S. cents (1939), about 15.37 U.S. cents in 1942. In 1939 government revenues were 19,930,879 krónur (estimated for 1943 at 33,736,100 kr.); expenditures, 19,378,318 kr. (estimated for 1943 at 28,333,238 kr.); national debt (1939), 56,648,000 kr.; notes in circulation (Dec. 31, 1945) 177,410,000 kr.; gold reserve (Dec. 31, 1945) 5,736,000 kr. Bank deposits were 452,421,000 kr. in July 1943. Note circulation jumped from 24,580,000 kr. in Jan. 1941 to 123,810,000 kr. in Aug. 1943; loans in the same period from 92,137,000 kr. to 170,594,000 kr. Gold reserves and bank capital remained in 1946 practically at the 1939 figures.

Trade and Communication.—In 1945 exports totalled 267,261,000 kr. and imports 319,755,000 kr.; 90% of the exports went to Great Britain and most of the rest to the United States while about 65% of the imports were supplied by the United States and 21% by the United Kingdom. Exports were almost entirely fish and fish products (95%); imports consisted chiefly of: fuels and lubricants 26,000,000 kr., metal and mineral products 39,000,000 kr., machinery and appliances 31,000,000 kr., textile products 56,672,000 kr., food products and tobacco 40,000,000 kr., and wood cork and paper 26,000,000 kr.

Iceland has no railroads, but in 1944 highways totalled 3,107 mi. There were 1,923 passenger cars, 192 busses, 1,991 trucks and 172 motorcycles. Also in 1944 Icelanders could listen on 11,500 telephones and 27,339 radio sets.

Of the population 7.2% was engaged in business, 21.3% in industry and 8.7% in communications.

Agriculture.—For 1944 the chief crops were: field hay 140,000 metric tons, meadow hay 80,000 metric tons and potatoes 8,000 metric tons. Of the population 30.6% was engaged in agriculture. The planted and seeded area covered 135,000 ac. Livestock (1944) numbered: sheep 610,000, cattle 40,000, horses 60,000, goats 2,000, hogs 1,000, poultry 75,000 and fur-bearers (fox and mink) 5,000.

Fisheries.—Of the population 15.9% was engaged in fisheries, and the

total product was 461,314 metric tons (1944).

BIBLIOGRAPHY.—Halldor Laxness, *Independent People* (1946); Helgi P. Briem, *Iceland and the Icelanders* (1945). (F. D. S.)

Ice Skating. Following a four-year recess because of World War II all national ice skating championships, speed and figure, were contested during 1946. Bob Fitzgerald, a 22-year-old air corps veteran, brought the men's speed championship to Minneapolis, Minn., once again, defeating a fellow townsman, defending champion Ken Bartholomew in the process.

Fitzgerald won the nationals with a 180 to 130 margin over Bartholomew. He also captured the 41st annual North American championship over his fellow townsman, 140 to 130. Mrs. Elaine Bogda Gordon of Chicago, Ill., captured the women's national speed championship, while Eileen Whalley of Winnipeg, Man., topped the women's field in the North American.

Bartholomew, who won the national and North American in 1942 before going into the army, defeated Fitzgerald in the eastern championships. Norma Davis of Long Island, N.Y., won the eastern women's. Robert Beal of Poughkeepsie, N.Y., won the men's middle Atlantic, while Beatrice Amann of Meriden, Conn., and Norma Davis of New York city were tied in the women's division. Roy Erickson of Brooklyn swept the men's indoor competition with firsts in the New York state, tri-state and eastern championships.

Richard Button of Philadelphia, Pa., won the national men's figure skating championship, revived after a two-year recess. Gretchen Van Zandt Merrill of Boston, Mass., won her fourth straight women's title. Other national figure skating champions were: pair—Donna Jeanne Pospisil and Jean Pierre Brunet, New York; four—Joan Yocum, Jacquelyn Dunne, Edward Van Der Bosch and Larry Van Der Bosch, Chicago; dance—Anne Davies and Carleton C. Hoffner, Jr., Washington, D.C. (M. P. W.)

Ickes, Harold L. (1874–), U.S. government official, was born March 15 at Frankstown Township, Pa. He was graduated from the University of Chicago law school, Chicago, Ill., in 1907. President Franklin D. Roosevelt, after assuming office in 1933, selected Ickes as his secretary of the interior. In July of the same year, he appointed him head of the Public Works administration. Ickes also held a multitude of other posts. He became solid fuels administrator in Nov. 1941 and coal mines administrator in 1943, and was petroleum administrator for war (Dec. 1942–Nov. 1945). In Feb. 1944 his proposal that the U.S. government build an oil pipe line across Arabia aroused the ire of many U.S. oil companies and the plan eventually fell through. In the fall of 1945, Ickes travelled to London where he signed the revised Anglo-American oil pact (Sept. 24).

Ickes stated before a senate naval affairs committee (Feb. 5, 1946), that Edwin W. Pauley, who was then up for consideration as under-secretary of the navy, tried to use political pressure to halt a government suit over oil lands. This led President Truman to assert that Ickes may have been mistaken in his charges, and Ickes thereupon resigned from the cabinet on Feb. 13.

Idaho. One of the far northwestern states of the U.S., belonging to the group regionally designated as the Pacific northwest and part of the original Oregon territory, Idaho was admitted as a territory by authority of Pres. Abraham Lincoln in 1863 and as a state on July 3, 1890; it is popularly known as the "Gem state." Area, 83,557 sq.mi., pop. (1940) 524,873, of which 66.3% was rural, 33.7% urban; (est. 1944) 531,573. There were 3,537 Indians in the state in 1940. Principal cities (1940) were Boise, the capital (26,130), Pocatello (18,133), Idaho Falls (15,024), Nampa (12,149) and

Twin Falls (11,851).

History.—State officers for 1945–46 were all Democratic, but new officers elected in Nov. 1946 (all Republican) were: governor, C. A. Robins; lieutenant governor, Donald S. Whitehead; secretary of state, J. D. Price; attorney-general, Robert Ailshie; auditor, N. P. Neilson; treasurer, Leila D. Painter; superintendent of public instruction, Elton Jones; both senate and house with a large Republican majority. The most important questions be-

GOV. C. A. ROBINS of Idaho, was elected on the Republican ticket on Nov. 5, 1946

fore the legislature were the acceptance of Peabody institute recommendations toward a revision of the public school system, increased taxation to carry on proposed postwar road improvement and public building construction. The following were elected to the U.S. congress: Henry Dworshak (former U.S. representative (Republican) senator; Representatives John C. Sanborn (Rep.) and Abe Goff (Rep.); Glen Taylor (Dem.) was elected to the senate in 1944.

Education.—School population 1945–46 greatly increased in the higher branches because of returned servicemen and women and totalled approximately 126,000. Elementary schools remained about the same with 81,673 pupils and 1,020 elementary schools with 3,800 teachers. High school enrolment was about 30,000 pupils with 1,318 teachers in 176 high schools.

Social Insurance and Assistance, Public Welfare and Related Programs.—There were two institutions for the insane—one at Blackfoot and one at Orofino, also a home for the feeble-minded at Nampa and a school for the deaf and blind at Gooding. A new tuberculosis hospital was also established in 1946 at Gooding. The penitentiary at Boise had an average of 235 inmates during the year; it has a capacity of 400. The State Industrial (Reform) school is located at St. Anthony and had a fairly constant population of 250.

Communications.—There were 4,910 mi. of state highway and approximately 33,000 mi. of county and forest roads with large appropriations for 1947 construction. There were about 3,000 mi. of railroads and an increased number of commercial air lines throughout the state. Telephone companies owned about 162,000 mi. of wire with an estimate of 86,000 instruments in use. Telegraph mileage approximated 9,000 mi.

Banking and Finance.—On Dec. 31, 1946, there were 36 state banks and 54 national banks with a combined capital of \$6,240,000 and a surplus of \$3,971,000; deposits for 1946 were \$148,999,000.

Agriculture.—Southern Idaho's main sources of income were dairying, fruit, hay, sugar beets, beans and potatoes.

Principal Agricultural Products of Idaho, 1946 and 1945

Crop	1946	1945
Wheat, bu.	31,148,000	30,696,000
Corn, bu.	1,289,000	1,334,000
Oats, bu.	6,806,000	6,806,000
Barley, bu.	11,600,000	11,840,000
Sugar beets, short tons	900,000	800,000
Dry beans, cwt.	1,824,000	1,726,000
Dry peas, bu.	1,500,000	1,760,000
Hay (tame), tons	2,246,000	2,103,000
Potatoes, bu.	49,321,000	44,220,000

Manufacturing.—No accurate figures were obtainable for 1946, but most factories had been reconverted to prewar use and were expected soon to be on a productive basis.

Mineral Production.—Because of strikes, portal legal procedure, etc., no average figures were available in 1946. Principal mineral products of the state were gold, silver, lead, copper and zinc. Idaho had 3 gem collecting associations which derived a sizeable income from the manufacture of jewellery and novelties from the state's 73 varieties of precious and semi-precious stones. (L. Md.)

Illinois. A north central state of the United States, admitted to the union in 1818, nicknamed the "Sucker state," sometimes called the "Prairie state." Total area 56,400 sq.mi. of which 55,947 sq.mi. are land. Pop. (1940) 7,897,241, including 3,957,149 males and 3,940,092 females; 7,504,202 white, 393,039 nonwhite. Population classed as urban was 5,809,650, rural not on farms 1,119,488, rural farm 968,103. Chicago (3,396,808) is the largest Illinois city, followed by Peoria (105,087); Rockford (84,637); East St. Louis (75,609); Springfield, the state capital (75,503).

History.—Despite two coal strikes, closing most of the state's mines, and the railroad strike, 1946 was a year of practically full employment in Illinois. Production was somewhat spotty. Only 2,966 Illinois veterans required a full year of government unemployment aid. A survey of 1,150 major manufacturing concerns disclosed an employment increase of 110,000 in 1946.

Illinois participated in the Republican sweep of the 1946 elections Nov. 5. The entire state Republican ticket was elected but the major change occurred in Chicago and Cook county where normal Democratic majorities were wiped out in most of the contests.

The total vote, 3,619,322, was a record for an off-year election but the gain in the poll of Cook county was 482,985 while the rise "down state" was only 87,025 over the previous off-year election of 1942. William G. Stratton, Republican candidate for congressman at large, defeated Mrs. Emily Taft Douglas, Democratic incumbent, by a plurality of 367,469, reversing Mrs. Douglas' 1944 plurality of 191,235. Richard Yates Rowe, Republican candidate for state treasurer, polled a plurality of 474,184 over Sam Keyes, Democrat. Vernon L. Nickell, Republican, state superintendent of education, had a plurality of 520,093 over his Democratic opponent, C. M. Engle.

A proposal to pay a bonus to all Illinois veterans of \$10 for every month in service at home and \$15 for every month served overseas was adopted by a vote of 2,173,425, for, to 980,345, against. A proposed constitutional amendment to make the state constitution easier to amend was defeated for lack of a majority of all votes cast. The vote was 1,273,653, for, to 368,108, against.

Dwight H. Green, Republican, was governor of Illinois in 1946; Edward J. Barret, Democrat, was secretary of state. Other incumbents, all Republicans, were Hugh W. Cross, lieutenant governor; Arthur C. Lueder, state auditor, and George F. Barret, attorney general.

The results of the 1946 elections gave the Republicans 20 representatives in congress from Illinois, the Democrats 6.

Education.—Public schools of Illinois in 1946 had 1,148,195 pupils, of whom 396,644 were in Chicago, 751,551 down state, with approximately 33,000 teachers.

Illinois ranked 40th among the states in percentage of school costs borne by the state. In 1946 approximately \$55,000,000 in state appropriations went to schools. Despite 174 consolidations affecting 897 school districts, the state still had more school districts than any other. The total was in excess of 11,000. Passage of a minimum teacher's salary law of \$100 per month, intended to force consolidation, did not prove effective and increases were planned.

The total of Illinois' educational expenditures for the year 1946 computed in full, was \$204,754,288.

Social Insurance and Assistance, Public Welfare and Related Programs.—

For the fiscal year ended June 30, 1945, expenditures for old age pensions and other public aid and welfare work constituted 43% of the cost of state government, the total being \$8,964,487. In 1946 the number of pension receivers rose to 126,388 and the average pension paid increased 18% over the year previous.

State unemployment compensation receivers dropped from around 80,000 in midsummer to 50,000 in Dec. 1946. Veterans drawing unemployment compensation under the federal veterans' readjustment act dropped from 74,500 in August to 30,000 in Dec. 1946. In the same period job offers increased from 136,940 to 143,452. Planned expenditures for public works and public housing were virtually at a standstill in 1946 because of shortages of labour and materials.

Communications.—Highway construction in 1946 amounted to only \$14,000,000 and about \$35,000,000 of unobligated highway revenues lay in the state treasury at the end of the year. Total collections of highway revenue for 1946 were about \$46,000,000.

Before World War II, Illinois had 13,683 mi. of high-type paved roads connecting with 75,000 mi. of township roads, lanes, etc., of which 50,000 mi. were unsurfaced. Illinois railway mileage in 1946 was 11,758, giving service to 80% of the communities in the state.

Banking and Finance.—The feature of Illinois banking in 1946 was the chartering of numerous new national and state banks. The state prohibits branch banking and after the failure of many small banks, 1931-33, was handicapped by the lack. This was only partly taken care of by a mushroom growth of private "currency exchanges."

The Illinois banking system comprised on June 30, 1943, 813 banks, of which 340 were national; 120 state banks were members of the federal reserve system; 353 state banks were nonmembers. The growth of deposits and holdings of government bonds was so rapid that the bank call at the end of 1945 disclosed that deposits of Chicago banks alone had increased to a greater total than those of the entire state on June 30, 1943.

The state government operated in 1946 on the biennial appropriations of the general assembly of 1945 which totalled \$773,000,000 and were to run until June 30, 1947. Total expenditures for the fiscal year ending June 30, 1945, were \$226,531,927 divided as follows: relief, pensions and social welfare 43%; highways 18%; education 15%; debt retirement 6%; federal aid matching 4%; all other purposes 11%. State revenues for the same fiscal year were \$270,066,886 classified as follows:—sales tax 33%; motor fuel tax 13%; liquor taxes 9%; motor vehicle taxes, 8%; federal aid 15%; public utility tax, 4%; cigarette tax 4%; all other taxes, licences and fees 11%.

Because of heavy sales tax collections the state's general revenue balance rose to \$169,266,062 in Oct. 1946, but was reduced to \$165,657,737 because of the state's purchase of an office building in Chicago for \$6,000,000. This balance was partly earmarked to care for a \$101,000,000 postwar public works and building program. The state debt prior to the referendum authorizing the soldier bonus bond at \$150,000,000 in noncallable bonds due in 1954 and 1959.

Agriculture.—Illinois farmers produced crops valued at \$1,100,000,000 in 1946, a year of bumper yields and high prices.

Table I.—Leading Agricultural Products of Illinois, 1946 and 1945

Crop	1946	1945
Corn, bu.	514,368,000	391,000,000
Soybeans, bu.	75,036,000	74,000,000
Oats, bu.	168,693,000	158,102,000
Wheat, bu.	19,553,000	25,000,000

Manufacturing.—The value of products manufactured in Illinois in 1939, according to the U.S. biennial census (last before World War II), was \$4,794,860,733; the number employed was 688,800; total wages and salaries were \$988,453,881. The principal industries and the value of their products were as follows: meat packing \$479,501,224; steelworks and rolling mills \$207,301,815; petroleum refining \$122,933,528; tractors \$121,550,621.

Table II.—Production of Coal and Petroleum in Illinois, 1944, 1943 and 1942

	1944	1943	1942
Bituminous coal, net tons	73,492,000	72,430,000	65,071,000
Petroleum, bbl.	76,987,000	77,637,000	106,590,000

Mineral Production.—Bituminous coal production was cut sharply in 1946 by two strikes of the United Mine Workers of America and by some sympathy walkouts of members of the rival Progressive Mine Workers union. Oil production continued to depend largely upon new wells. As many as 35 new wells with total daily production of 4,389 bbl. were reported in one week of October as a result of intense exploration. The value of minerals produced in Illinois in 1944 was \$331,497,000. (L. H. L.)

Illinois, University of. George Dinsmore Stoddard, formerly New York commissioner of education and president of the University of the State of New York, became president of the University of Illinois on July 1, 1946, upon the retirement of Arthur Cutts Willard, president from 1934.

Dr. Andrew C. Ivy, noted Chicago physiologist and clinical investigator, became vice-president and head of the Chicago professional colleges of the university in Sept. 1946, succeeding Dr. Raymond B. Allen, executive dean.

The university met one of the greatest emergencies in its history by providing educational facilities for almost every individ-

STUDENTS lined up at Chicago's Navy pier on Oct. 15, 1946, to enrol in the new Chicago undergraduate division of the University of Illinois

ual who qualified for admission in the fall of 1946. Two undergraduate divisions were opened at the Navy pier in Chicago and at Galesburg, Ill., and the extension division offered freshman courses in 30 high schools throughout the state. Including the medical, dental and pharmacy schools in Chicago, total enrolment reached 27,216, of whom more than 50% were veterans.

Temporary housing of various kinds enabled 18,560 to enrol at Urbana-Champaign, 4,000 were at Navy pier and 2,000 at Galesburg.

The institute of aeronautics, a pioneering venture launched in 1945 as a horizontal administrating unit for all university aeronautical activity, had become a leader among institutions of higher learning. Flight instruction was provided at the 762-ac. airport. Organized on a similar basis was the new institute of labour and industrial relations, established in Sept. 1946, and engaging in research, extension programs and on-campus instruction.

Under construction on the Urbana campus was a new building to house a betatron designed to generate more than 250,000,000 electron volts of energy and expected to produce cosmic ray effects in the laboratory. The betatron was invented in 1940 by Prof. Donald W. Kerst of the university's physics department.

A university committee continued to work with community leaders in effecting the development of industrial and recreational resources in the southern Illinois region, where there was surplus labour and widespread dependency. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Illiteracy. The year 1946 saw a sharp focusing of the eyes of the world on education and the need for reducing the illiteracy rates in every nation.

The educational situation in Germany was typical of the situation throughout the war-devastated countries of Europe. The university student taking notes on the margins of newspapers exemplified one of the most pressing needs of the Ger-

man educational situation, paper. This was only one example of a dearth of teaching and learning aids at every level. Even where school buildings escaped fire and bomb, many were still unavailable for educational purposes because of requisitioning by the occupation forces, by United Nations Relief and Rehabilitation administration and by German housing authorities. On Sept. 1, 1946, 349 elementary schools in the U.S. zone were still used for purposes other than education. Another distressing fact was the lack of youth in the ranks of the German teaching profession. The average age of teachers in one section was 52.

The minister of education in New Zealand stated that New Zealand's objective is a maximum of 30 children in primary and secondary school classes and extension of the distribution of free textbooks. A school building program designed to raise the standard of classroom accommodations at all levels was to be put into effect and the compulsory school age was to be raised.

In Ecuador it was estimated that almost-two thirds of the 3,000,000 inhabitants were incapable of the fundamental processes of reading and writing. Following Frank C. Laubach's "Each one teach one" theory, every literate pupil was instructed to pass on his knowledge to one of his less fortunate fellows. More than 60,000 people were instructed in the rudiments and received the diploma which admits them into the ranks of enfranchised citizens.

Of Mexico's 20,000,000 people 45% were still illiterate in 1946. Experience proved that additional schools were not enough to boost the literacy rate. When the children could bolster the family budget by working, parents were reluctant to send them to school and adults employed for long hours at low wages refused to attend educational centres. The Mexican literacy law makes it compulsory for each educated citizen between 18 and 60 years old to teach one illiterate person between 6 and 40 to read and write. All children between 6 and 14 and all illiterates between 14 and 40 are required to learn.

In the U.S. a comprehensive one-year project to attack the problems of functional illiteracy among Negro adults was advancing into its third phase. The purpose of the project is the lifting of the educational level of the large group of adult Negroes described as "functionally illiterate."

The interest of the United Nations Educational, Scientific and Cultural Organization (U.N.E.S.C.O.) was drawn to the problem of illiteracy throughout the world and U.N.E.S.C.O. members proposed that "this Organization should launch upon a world scale an attack upon ignorance, by helping all member states who desire such help to establish a minimum Fundamental Education for all their citizens." At the Nov. 19, 1946, U.N.E.S.C.O. conference in Paris, it was suggested that in the education section of the permanent secretariat a panel on fundamental education be established, consisting of a permanent staff continuously in service at U.N.E.S.C.O. headquarters in Paris supplemented by other personnel to be brought in for consultation at various times. This staff would be available for conferences and consultation in every country and for the study of achievements, national needs and the part U.N.E.S.C.O. should take in the movement. Some of the proposed activities of the panel are: preparation of bibliographical data; statistical studies; dissemination of lists, brochures and governmental enactments; documentation of films, radio programs, charts, maps and all teaching aids.

Immigration and Emigration. The migration of aliens to and from the United States is regulated by law and treaty, and is under the jurisdiction of the commissioner of immigration and naturalization of the department of justice. The principal immigration acts are the act of Feb. 5, 1917, which sets certain mental, physical, moral, racial and economic standards; and the quota act of May 26, 1924, which limits the number of aliens who may enter for permanent residence from certain countries.

More than 76,000,000 aliens and citizens, principally persons who crossed and recrossed the land borders, entered the United States during the fiscal year ended June 30, 1946. Arrivals and departures during 1945 and 1946, exclusive of border crossers, travellers between the United States and the insular possessions and agricultural and railway track labourers admitted from Mexico, were as reported in the table.

*Arrivals and Departures of Aliens and Citizens
During Fiscal Years Ended June 30, 1945 and 1946*

	1946	1945
Arrivals:		
Aliens admitted	312,190	202,366
Immigrant	108,721	38,119
Nonimmigrant	203,469	164,247
U.S. citizens	274,543	175,568
Aliens debarred	2,942	2,341
Departures:		
Aliens	204,353	93,362
Immigrant	18,143	7,442
Nonimmigrant	186,210	85,920
U.S. citizens	230,578	103,019

During the fiscal year 1946, 108,721 immigrant aliens were admitted to the United States for permanent residence. This represented an increase of 185% over the 38,119 immigrants admitted in the previous year and was the largest number admitted in any year after 1930. The principal countries from which these immigrants came were: England (30,922); Canada (20,414); Mexico (7,146); and France (5,708). Among the immigrants were 2,551 displaced persons from the U.S. occupation zones in Europe who were admitted under the president's directive of Dec. 22, 1945. There were 29,095 quota immigrants admitted, or 18.9% of the permissible quota of 153,879, and 79,626 non-quota immigrants. The principal groups of nonquota immigrants consisted of 44,775 wives, 61 husbands and 721 alien children of citizen members of the U.S. armed forces admitted under the

IMMIGRANT ORPHANS sent to the U.S. by the U.N.R.R.A. arrived in New York on June 18, 1946. The one on the left was from Lithuania, and the other two from Poland

act of Dec. 28, 1945, and 29,396 natives of nonquota countries. More than half of the war brides came from England and most of the natives of nonquota countries came from the bordering countries of Canada and Mexico. Aliens admitted for temporary stay and resident aliens returning from a brief sojourn abroad totalled 203,469.

There were 18,143 emigrants who departed during the fiscal year 1946, as compared with 7,442 in the preceding year, or an increase of 144%. The principal countries to which the emigrants went were Great Britain (3,798); West Indies (1,384); France (1,192); and Mexico (1,069).

During the fiscal year, 2,942 aliens seeking admission for 30 days or longer and 2,708 aliens who wished to come in for less than 30 days were excluded from entry into the United States.

The continued man power shortage led to further appropriations for the continuation of the importation of alien labourers from near-by countries. On June 30, 1946, there remained in the United States 65,745 agricultural labourers and approximately 3,000 railway track workers.

The number of illegal entries to the United States increased greatly, especially along the Mexican border. The immigration border patrol apprehended 99,591 deportable aliens, the greatest number recorded from the time the patrol was organized in 1924. During the fiscal year 1946, 14,375 aliens were deported from the United States, 101,945 aliens who had been adjudged deportable were allowed to depart at their own expense without warrants of deportation and 21 indigent aliens were returned to their own countries at the expense of the government of the United States. (See also ALIENS; CENSUS DATA 1946; REFUGEES.) (U. C.)

Income, Distribution of: see WEALTH AND INCOME, DISTRIBUTION OF.

Income and Product, U.S. Preliminary estimates of the national income and gross national product of the United States for the year 1946 show only moderate changes from the 1945 aggregates. The national income increased slightly to \$164,000,000,000, compared with the 1945 total of \$161,000,000,000. On the other hand, a small decline was recorded for the gross national product which decreased to \$194,000,000,000 in 1946 as compared with \$199,200,000,000 in 1945. In the case of both aggregates the current dollar totals for 1946 reflect the substantial rise in prices which occurred after the middle of the year as wartime controls were relaxed. Nevertheless, the reconversion of industry to peacetime production was so rapid during the year that the level of economic activity did not fall far short of wartime peaks.

Meaning of National Income and Gross National Product.—National income as understood in this survey represents a summation of the net earnings of the various factors of production derived from their association in current economic production. Both money income and income in kind are included, so long as they are derived from participation in current production. Such income receipts as relief, unemployment benefits, pensions, gifts, capital gains or losses and gains from illegal activities are excluded since they do not represent earnings derived from current productive activity. The incomes included in the compilation are net incomes; that is, in the case of business enterprises, the incomes are counted after deduction of costs of doing business and after allowance for depreciation and business taxes. In the case of corporations, the income is taken after allowance for income and excess profits taxes. The esti-

mates are limited to those incomes which are ordinarily derived from the market economy. Thus, the value of the services of housewives is not included, whereas the income derived from government employment or government obligations is included. It is well to emphasize that the national income is not simply the sum of money incomes of all persons in the United States, such as might be reported for income tax purposes.

The gross national product, as measured by the U.S. department of commerce, represents a summation of three major components: (1) the market value of goods and services flowing to consumers, (2) the value of the gross output of capital goods retained by private business and (3) the cost value of the goods and services produced or purchased by government. The gross national product differs from the national income in that no allowance is made for depreciation and other reserves (which constitute business expenses in the computation of income) or for taxes paid by business.

Taken together, the national income and national product estimates provide a comprehensive picture of the current economic activity of the United States as a whole. The two sets of estimates represent the receipts (national income) and expenditures (national product) sides of a consolidated national account showing the major transactions that occurred during the year relative to current production of goods and services. The data are useful in giving quantitative expression to economic trends and problems of the national economy as well as in comparing the operations of an individual business firm with the national totals for all economic activity.

Changes in U.S. National Income, 1919-46.—Estimates of national income from 1919 to 1946 are shown in Table I. It should be noted that the economic boom associated with World War I reached its high point in 1920. There followed a sharp and short liquidation in 1921 and then an almost continuous upsurge of economic activity during the prosperous '20s, with a new high for national income in 1929 not surpassed until 1941.

The estimates in the accompanying tables are in terms of dollars, and consequently are affected by the general level of prices as well as by the physical quantity of goods and services produced. Since for many purposes the physical quantity of national production, or real national

national income rose more than \$6,000,000,000, even though the program was not inaugurated until the middle of that year. It was not until 1941, however, that the full impact of the rearmament program became apparent. In that year the national income rose by \$17,000,000,000.

With the actual outbreak of war at the end of 1941 the efforts to obtain the maximum output of armaments in the United States were intensified, leading to an ever greater use of available economic resources. As a consequence, the national income continued to expand in 1942 and 1943 with a gain in the earlier year of more than \$25,000,000,000 and a gain of more than \$27,000,000,000 in the latter.

As may be seen by a comparison of the national income in current dollars and in 1935-39 dollars as shown in Table 1, the rise in the national income after 1940 was in part the result of the rising trend of prices, but the larger part of the expansion represented an increase in real income.

The period of rapid wartime expansion of the national income came to an end at about the close of 1943. By that time the national income was flowing at an annual rate of approximately \$155,000,000,000, and represented virtually complete utilization of economic resources. Since inflation of the national income through rising prices was held in check during 1944 by the price control and rationing programs, the national income in that year rose only moderately to \$160,700,000,000. It may be seen, therefore, that the fairly substantial increase in the national income from 1943 to 1944 occurred largely during the earlier year. Even so, 1944 national income exceeded the 1943 total by only 8% in terms of current dollars, while in terms of constant dollars the increase was limited to 6%.

This trend continued until the middle of 1945 when the national income reached its wartime peak. After the end of the war in Europe there was some curtailment of the war production program but rapid re-employment in civilian industries tended to maintain the level of income. With the ending of the war in the Pacific, however, the economic situation was drastically changed. The immediate liquidation of

income, is required, a series depicting this volume is also shown in Table I, average prices of 1935-39 being used as a base.

In assessing the importance of the rise in national income over a period of time, it is essential to take account of the increase in population. As population rises, there are more persons to share in the goods being produced for present and future consumption and also more hands available for contributing to total output. The changes in income produced per capita, after adjustment for fluctuating prices, are shown in Table I.

The outbreak of World War II marked 1939 as the end of a definite phase in the economic life of the United States. The stimulus provided by the great U.S. defense effort was already evident in 1940, when the

the war production program was begun with the result that employment and income turned downward. Although controls over peacetime production were removed, the reconversion problem was so large that the expansion of civilian output could not immediately fill the gap left by the elimination of war production. As a consequence, the level of national income in the late months of 1945 was significantly below that prevailing in the earlier part of the year.

The reconversion decline in economic activity reached its low point in the first quarter of 1946. During the remainder of the year the trend was sharply upward with the expansion in the output of civilian goods more than offsetting the further decline in the military sphere. The rising volume of production produced a corresponding upward trend in the national income, and this was augmented by a sharp rise in prices after the middle of the year as wartime price controls were relaxed. The net result was that total national income for 1946 was slightly higher than the aggregate for the preceding year.

Distributive Shares of the National Income.—The distributive shares of the national income are shown in Table II. Changes in the distributive shares in 1946 followed a different pattern than during the World War II years of income expansion. After the end of the war total wages and salaries began to decline as a result of the decline in total employment, the demobilization of the armed services and the reduction in overtime work. These contracting influences were offset to a considerable extent by the continuous increase in wage rates. In 1945 total salaries and wages were only a little more than \$1,000,000,000 below the peak level of 1944. In 1946, however, wage and salary payments dropped to \$106,000,000,000 from the total of \$111,400,000,000 in the preceding year. As civilian wages and salaries increased from \$95,200,000,000 in 1945 to \$99,800,000,000 in 1946, the reduction in the aggregate reflected the contraction of military pay rolls.

In contrast to the record of recent years corporate profits after taxes increased substantially in 1946. This component of the national income showed the largest percentage rise for the year, from \$9,000,000,000 in 1945 to an estimated \$12,000,000,000 in 1946. While the favourable level of profits indicated the rapid reconversion of business to a peacetime basis, the rise in profits resulted primarily from the elimination of the excess profits tax at the end of 1945. Only a few industries which had special reconversion difficulties or which were adversely affected by labour disputes failed to show substantial increases in profits over the preceding year. The increase in profits was not reflected in dividend payments which rose by only \$500,000,000 from the level which prevailed in 1944 and 1945. Dividend disbursements were held down in part by capital requirements in the reconverting industries, particularly by the need for raw material and goods-in-process inventories.

Noncorporate business also showed a marked increase in income in 1946. In the agricultural field there was a gain of about 20% to a total of \$15,000,000,000 compared with the 1945 aggregate of

†Preliminary.

‡Less than \$50,000,000.

\$12,500,000,000. The large rise in agricultural prices after the middle of the year was the primary factor accounting for the income gain. The net income of nonagricultural entrepreneurs increased by somewhat smaller proportions—the preliminary estimate for 1946 of \$15,000,000,000 contrasting with the previous year's total of \$13,100,000,000. While the rising trend of prices contributed to the income gain, it also reflected the larger volume of civilian goods being distributed to consumers.

Income from interest increased almost \$1,000,000,000 in 1946 to attain a total of \$8,600,000,000. The larger payments of interest on the public debt were the major factor in this rise, though there was in 1946 a substantial increase in private borrowing for the first time in several years. Net rents and royalties rose to only a small extent as fairly rigid controls over rents continued to be maintained throughout the year.

Gross National Product.—The decline in the gross national product in 1946 to \$194,000,000,000 from the figure of \$199,200,000,000 a year earlier resulted entirely from the drop in war spending of the government. The rapid liquidation of the war program is shown by the drop in war expenditures from \$83,700,000,000 in 1944 to \$17,000,000,000 in 1946. The curtailment of military expenditures after the end of the Japanese war had already reduced total war expenditures to \$69,400,000,000 in 1945 from the peak of the previous year.

The release of economic resources from wartime requirements permitted an expansion of all the civilian components of the gross national product in 1946. Nonwar expenditures of the federal government and the outlays of the state and local governmental bodies increased significantly, even though the continuing shortages of labour and materials were still exercising a dampening influence in such spheres as public works expenditures.

Much greater expansion occurred, however, in the availability of goods and services for private use. This vital segment of the gross product increased from \$115,500,000,000 in 1945 to \$159,000,000,000 in 1946, reflecting the increased quantity of goods and services available as well as the substantial rise in prices of those goods. The increase in capital outlays was most spectacular. Gross investment expenditures reached a total of \$32,000,000,000—more than three times as much as the preceding year and far higher than the previous record total attained in 1941. It can be seen from Table III that construction activity made a significant start to a peacetime volume of business with outlays of \$8,000,000,000 compared with only \$2,600,000,000 in 1945. Expenditures on producers' durable equipment approximately doubled from the preceding year to attain a total of \$13,000,000,000. The process of re-conversion, involving the filling of the raw materials and goods-in-process pipe line in the civilian goods industries, led to a substantial increase in business inventories, marking the first period of inventory accumulation since the first year of World War II. With the ending of lend-lease, net exports of goods and services also increased to record levels. The total net balance in 1946 of \$5,000,000,000 reflected the tremendous shortages of goods abroad that resulted from wartime limitations. Its financing was made possible in part by government loans and in part by the gold and dollar assets accumulated by foreign countries during World War II.

Consumers' expenditures recorded a substantial increase in 1946 to attain a record level of \$127,000,000,000. The increase of more than \$20,000,000,000 from the preceding year was in part the result of higher prices. It also reflected, however, the larger volume of goods and services flowing to consumers. This was made possible to some extent by the reduction in military purchases and the transfer of goods to civilian channels. In addition, there was a substantial increase in the production of the consumers' goods industries. Expenditures on durable goods of \$14,000,000,000 in 1946 were almost double the previous year's total, while outlays for nondurable goods showed a spectacular increase from \$65,600,000,000 in 1945 to \$77,000,000,000 in 1946. It was evident that civilians generally were entering the market freely to make good for wartime shortages. The unusual factor in the situation was the purchases of returning servicemen who were re-entering civilian life for the first time in several years.

Use of Consumers' Income.—Statistics on the disposition of income payments to individuals are given in Table IV. The income payments aggregate differs from the national income in several respects. It includes transfer payments of the government for such items as relief,

unemployment compensation and dismissal pay to veterans of the armed forces, whereas these payments are not included in the national income. On the other hand, the national income includes the undistributed profits of corporations and business contributions to social insurance funds which are not included in income payments.

The change in income payments from 1945 to 1946 was approximately equal to the change in national income. The disposition of this income, however, showed a marked change from the wartime pattern. It

Table IV.—Disposition of National Income, 1939–45*

Equals: Net savings of individuals	6.0	33.3	38.9	33.1	18.0

*Detail will not necessarily add to totals because of rounding.

†Preliminary.

may be seen that tax payments declined for the first time after the outbreak of World War II with the result that the disposable income of individuals increased more than total income payments. The spectacular postwar change came, however, in the allocation of income after taxes between expenditures and savings. As already mentioned, consumers' expenditures increased very substantially—to a far greater extent than was made possible by the reduction in taxes. This necessarily implied a substantial reduction in the volume of current savings. Net savings of individuals in 1946 was estimated at \$18,000,000,000 in contrast to the figure of \$33,100,000,000 for the preceding year and the wartime peak in 1944 of \$38,900,000,000. The 1946 level was about a normal proportion of savings to income and reflected the relaxation of the wartime incentives to save as well as the wartime restrictions on spending as a result of the shortages of goods and the limitations imposed by price control and rationing. (See also BUDGET, NATIONAL; BUSINESS REVIEW; DEBT, NATIONAL; WEALTH AND INCOME, DISTRIBUTION OF.) (M. Gt.)

Income Tax: see TAXATION.

India. A subcontinent projecting from the mainland of Asia, comprising 11 major or "autonomous" provinces, five minor areas directly administered by the central British government and a large number (between 500 and 600) of states under Indian rulers. British India (the 16 major provinces and minor areas) has its capital at New Delhi and is under a viceroy and governor-general (Field Marshal Viscount Archibald Wavell), who is also the representative of the crown in its relations with the native states. Total area: 1,581,410 sq.mi. (including the native states and agencies total of 715,964 sq.mi.); pop. (1941 census): 388,997,955. Chief cities (pop. 1941): Calcutta (2,108,891); Bombay (1,489,883), Madras (777,481); Hyderabad (739,159); Delhi (521,849); Lahore (671,659). Languages: Hindi, Tamil and Urdu the most important; religions: Hinduism (approx. two-thirds), Mohammedan (approx. one-fifth). Ruler: George VI, emperor.

History.—The year 1946 opened ominously. The failure of the viceroy to bring Hindus and Moslems together on his executive council had greatly exacerbated communal feeling. There was intense excitement over the trial of members of the so-called "Indian National army," who were accused of acts of barbarity against Indian sepoys, and this led to rioting in the principal cities and attacks on Europeans. Added to all this, there was a threat of a famine in southern India, because of a failure of the rains. The elections to the provincial legislatures, the first held after 1937, resulted in the return of supporters of the Indian National congress in 8 out of the 11 provinces with greatly increased majorities, while the Moslem league captured practically all the seats reserved for Moslems. The minor political parties were virtually eliminated.

In these circumstances the British government decided to send out a cabinet mission, consisting of Lord Pethwick-Lawrence, secretary of state for India, Sir Stafford Cripps, and A. V. Alexander. The object of the mission, which went to India at the end of March, was not to settle the constitution, but to set up

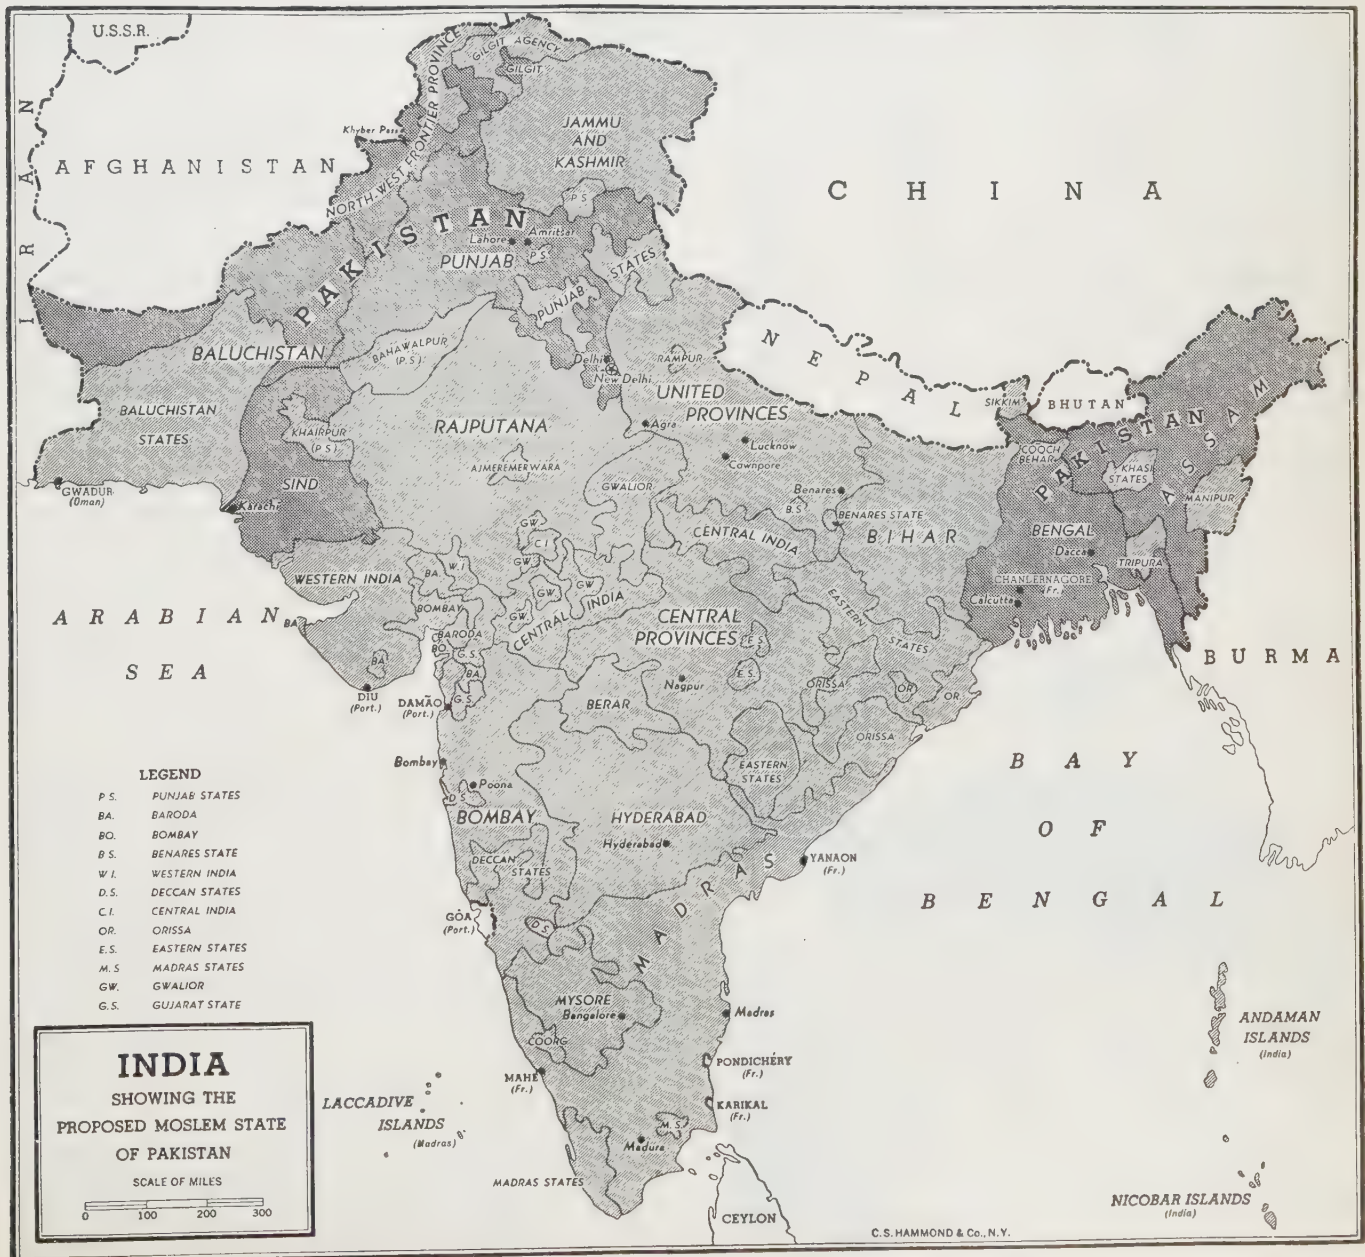

machinery through which Indians could draw up a constitution for themselves. The mission was unable to bring about an agreement, and on May 16 it was obliged to issue proposals of its own. Pakistan was rejected, but the central government was to be a minimal one, limited to defense, communications and foreign affairs. Moreover, provinces were to be empowered, if they wished, to form groups, each with its own executive and legislature. This "three-tiered" constitution would, if adopted, give the Moslems the substance of Pakistan without the partition of India to which the Congress party was so firmly opposed. A constitution-making body would be set up in which each province would be assigned a total number of seats proportionate to its population, the seats being allotted to the main communities in proportion to their numbers in each province. Representatives of the states would also be included. This proposal was accepted by both parties.

The mission returned on June 29. It had failed to secure the concurrence of the parties to an interim government, and the viceroy was forced to set up an executive council of officials as a temporary measure. On July 25 the results of the elections to the constituent assembly were announced; the congress had won 201 out of the 210 seats allotted to general constituencies,

while the Moslem league carried off 73 out of the 78 seats reserved for Moslems.

On July 29 the Moslem league, by way of protest against speeches made by Congress leaders, withdrew its agreement to the cabinet mission's long-term plan. As the result of a "direct action day," serious communal rioting broke out in Calcutta, causing more than 3,500 deaths and damage to property amounting to £1,000,000. On Aug. 25 the viceroy published the names of his new interim government. It consisted mainly of prominent Congress leaders, but Lord Wavell made it clear that the Moslem league was at liberty to propose to him 5 names out of a total of 14, of whom 6 would be members of the Congress party and 3 of the minorities. The interim government assumed office on Sept. 1 with Jawaharlal Nehru as vice-president.

On Oct. 5, by the good offices of the nawab of Bhopal, chancellor of the chamber of princes, a meeting was arranged between Mohammed Ali Jinnah and Pandit Nehru, and on Oct. 15 it was announced that the viceroy's offer had been accepted by the league. Three members of the cabinet resigned to make way for the newcomers, who did not include Jinnah. One of the league nominees was Jogendranath Mondal, the Bengal depressed classes leader. It was announced that A. Kripalani was

to succeed Pandit Nehru as president of the Indian National congress. The opening meeting of the constituent assembly, it was announced, should be held on Dec. 9, but a fresh crisis arose over the interpretation of the cabinet mission's plan. The Moslem league maintained that the question whether a group of provinces should have a separate government should be decided by a simple majority vote of the whole group, and this was the view endorsed by the British cabinet. The Indian National congress held that the provinces should decide individually whether they should form groups; if this were upheld it would disrupt the plan altogether. The Moslem league announced that they would boycott the constituent assembly until the matter was settled. A meeting between the viceroy, the Indian leaders and the British cabinet was held in London at Whitehall, but failed to arrive at any agreement, and the constituent assembly was opened without the representatives of the Moslem league or the Indian states. Pandit Nehru announced that India was to be a sovereign republic, and the meeting was adjourned until Jan. 20, 1947. (See also BURMA; FAMINES; WORLD WAR II.)

"OUT OF THE FRYING PAN . . . ?" drawn by Shoemaker of the *Chicago Daily News* in 1946

Industry.—Total number of factories (1943) 13,209; average number employed 2,436,312. Cotton (1941-42): yarn spun 788,590 short tons; woven goods 4,493,613,268 yd.; number of mills (1944) 407; average number employed daily (1944) 505,562. Jute (1940): number of mills 108; average number employed 488,884. Mines (1943): average number employed 349,361.

Education.—Recognized institutions in British India (1943): primary schools for boys 153,380, for girls 22,654; scholars (boys) 8,566,838, (girls) 3,027,420. Secondary schools for boys 13,536, for girls 1,955; scholars (boys) 2,324,618, (girls) 413,159. Special schools for boys 11,017, for girls 763; scholars (boys) 437,539, (girls) 40,187. Colleges for men 389, for women 66; students (men) 134,832, (women) 13,892. Unrecognized schools: for boys 12,066, for girls 3,676; scholars (boys) 374,094, (girls) 90,599. Universities (1941) 16 in British India (students 109,098 men and 5,006 women), 3 in Native states.

Finance.—Central government: revenue (est. 1946-47) Rs.3,069,993,000; expenditure (est. 1946-47) Rs.3,556,997,000. Public debt (March 1945) Rs.18,818,966,000. Notes in circulation (July 31, 1946) Rs.12,117,374,000. Gold reserve (July 31, 1946): gold Rs.443,412,000. Sterling securities (March 1945) Rs.10,179,481,000. Currency: 1 rupee (Rs. 1): Rs. 100,000=1 lakh (written Rs.1,00,000); Rs. 10,000,000=1 crore (written Rs.1,00,00,000). Exchange rate (Sept. 1946): Rs.1=30.16 U.S. cents.

Trade and Communication.—Overseas trade (1945): imports Rs.2,159,529,000; exports Rs.2,177,536,000. Communication: roads (1942) in British India, 85,792 mi. for motor traffic and 261,340 mi. unsurfaced; railways (route mileage, March 1943) 20,698 mi. broad gauge, 16,010 mi. metre gauge, 3,868 mi. narrow gauge; shipping (monthly average 1939) 924,200 tons entered, 917,500 tons cleared; motor vehicles licensed (March 31, 1940: British India) 94,788 cars and taxis, 43,187 commercial vehicles, 8,602 cycles; wireless receiving set licenses, all India (1945) 199,589; telephones (March 31, 1944) c. 116,000, exchanges 2,600.

Indiana. An east north central state with the popular name of "Hoosier," Indiana was admitted to the union Dec. 11, 1816, as the 19th state. Total area of the state is 36,325 sq.mi., including 314 sq.mi. of inland lakes and rivers. Pop. (1940 census) 3,427,796. The 1940 census showed the population to be 55.1% urban and 44.9% rural; 93.2% native white, 3.2% foreign-born white and 3.6% Negro. Estimated population in 1946 was 3,900,000. Capital, Indianapolis (pop. 1940, 386,972), the largest city. Other cities: Fort Wayne (118,410); Gary (111,719); South Bend (101,268); Evansville (97,062); Hammond (70,184); Terre Haute (62,693); East Chicago (54,637); Muncie (49,720); Anderson (41,572).

Political History.—The general assembly did not meet in 1946. State government officials held a series of "clinics" in various cities to inform the people how their government operated. The retirement of public employees under provisions of the new state retirement act began on July 1, 1946. State troops were used in one strike at Connersville. A faction appeared in the Republican party demanding a direct primary in place of the convention system of nominating candidates for office.

Elected officers of the state in 1946 were Ralph F. Gates, governor; Richard T. James, lieutenant governor; Rue J. Alexander, secretary of state; Frank T. Millis, treasurer; Alvin V. Burch, auditor; James A. Emmert, attorney general; Clement T. Malan, superintendent of public instruction. They were all Republicans.

Education.—The number of schools in the state in 1945-46 was 2,725. Enrolment in the elementary or common schools was 458,822, with 11,656 teachers. Enrolment in the high schools (grades 9-12) was 169,555, with 9,522 teachers. Parochial schools had an enrolment of 46,800 in the elementary grades and 9,352 in high-school. For the year 1945-46, the state added \$30,983,825 to the \$79,420,756 raised by local units of government for the support of schools. The state provided \$7,460,875 for the 4 state colleges.

Social Insurance and Assistance, Public Welfare and Related Programs.—In 1945-46 the state's welfare program cost \$26,628,620, of which \$10,725,288 was paid from federal funds, \$7,990,961 from state funds and \$7,912,371 from county funds. Old age assistance cost \$17,877,825, blind assistance \$720,819, aid to dependent children \$2,803,035 and child welfare \$3,271,468. Receipts of the state for unemployment insurance for the year ending June 30, 1946, were \$25,513,716. Benefits paid out were \$29,595,365, not including federal payments to war veterans.

In 1946 the state maintained nine institutions for mental cases, including an epileptic village; seven homes, hospitals and schools; three university hospitals; and six correctional institutions. As of June 30, 1946, inmates of mental institutions totalled 12,925 and inmates of correctional institutions, 10,414.

Communications.—Total mileage of state highways on June 30, 1946, was 10,389 out of a total of 76,700 mi. of roads in the state. Expenditure of the state highway commission on roads in the fiscal year 1945-46 amounted to \$17,576,170. There were 6,660 mi. of steam railroads (first main tracks) and 241 mi. of electric railroads. The estimated

number of telephones in the state at the end of 1946 was 788,000. There were 190 airports.

Banking and Finance.—On June 30, 1946, there were 370 state banks and trust companies with total resources of \$1,433,561,288 and total deposits of \$1,352,465,842. There were 126 national banks with total resources of \$1,581,279,000 and total deposits of \$1,499,126,000. State savings and loan companies numbered 175 as of Dec. 31, 1945, with resources of \$131,976,745. The assets of federal savings and loan associations as of the same date were \$178,392,000.

On June 30, 1945, the state had a balance of \$84,424,697. During the fiscal year the state treasurer received \$338,767,436, and expenditures amounted to \$315,253,955, leaving a balance on hand June 30, 1946, of \$107,938,177. The state constitution strictly limited borrowing; consequently there was no state debt in 1946.

Agriculture.—Corn production set a new all-time high record in 1946, although the yield per acre was 51 bu., whereas in 1945 the national record of 53 bu. had been established. Other grains ran slightly less than in 1945 because of a dry summer. The apple crop was much improved over the disappointing one in 1945. The Indiana State fair was resumed in September after a war lapse of six years.

Leading Agricultural Products of Indiana, 1946 and 1945

	1946	1945
Corn, bu.	231,489,000*	231,292,000
Wheat, bu.	29,692,000*	34,920,000
Oats, bu.	56,160,000	57,582,000
Soybeans, bu.	25,346,000*	28,587,000

Manufacturing.—During World War II Indiana received government contracts for war supplies amounting to \$9,000,000,000 and ranked 7th in the United States in war production. A year of reconversion to the production of automobiles and automotive bodies and parts, steel, electrical machinery, furniture, glass and farm implements was 1946. Much meat packing, flour milling, food canning and drug compounding was also done in the state.

Mineral Production.—In the fiscal year 1945-46, 9,860,855 tons of coal were taken from 44 shaft mines employing ten or more men. Strip mines and mines employing less than ten men were not included in these figures. There were 7,219,631 bbl. of oil pumped from 2,640 wells in the state during 1946. (H. H. P.)

Indiana University. Indiana university's enrolment in 1946 was approximately double the prewar peak. A housing building program started in the spring in anticipation of a record enrolment enabled the university to house more than 6,000 persons as compared with 1,025 before World War II.

Important academic events at the university during 1946 included the establishment of a school of health, physical education and recreation, the replacement of the extension division with a broader division of adult education and public service and the separation of the geology and geography department into two distinct departments.

One of Indiana university's faculty members, Dr. Hermann J. Muller, professor of zoology, was awarded the 1946 Nobel prize in medicine and physiology.

The Rockefeller foundation made a grant of \$95,500 to the university to finance a six-year research program in genetics, and another one of \$27,500 for the development of east European studies. The university also received from the Research Grants office of the National Institute of Health a grant of approximately \$15,000 a year for three years to further the study of organisms concerned in the cause of gas gangrene of man and certain animal diseases. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (H. B. Ws.)

Indians, American. The federal government took a forward step toward meeting the health and education needs of the natives of Alaska during 1946 by transferring the Sitka naval base to the department of the interior. The existing structures on Japonski Island near Sitka

were being converted to house a vocational boarding high school for 600 children, thus more than doubling the high school facilities for Alaska natives and making it possible to provide facilities for several hundred orphaned and dependent children of elementary age. Funds were also provided for the erection of a 300-bed tuberculosis sanatorium at the same location. Beautiful Mount Edgecumbe, just west of Sitka, gave its name to the new school and hospital.

The Navaho Indians, who constitute the largest Indian tribe in the U.S., were becoming concerned over the lack of educational facilities for their children. Despite the fact that the government signed a treaty with the Navaho in 1868, promising to provide a school room and teacher for every 30 Navaho children of school age, the school facilities of 1946 were adequate for only 5,000 of the 20,000 Navaho children who needed schooling. The entire tribal council visited Washington, D. C., during May and appeared before committees of congress, the budget bureau and the secretary of the interior, appealing for appropriations to provide additional schools.

The Fort Berthold Indians in North Dakota protested vehemently against plans of the army engineers to erect a flood control dam on the Missouri river at Garrison. The reservoir created by this dam would flood the entire agricultural areas of the Fort Berthold reservation. As a result of their protest against the dam, congress prohibited any construction on the proposed dam until an agreement had been reached between the secretary of the interior and the secretary of war providing satisfactory alternate lands for the Indians. This did not satisfy the Indian claim but the army showed no indication of abandoning the project.

On Aug. 13, 1946, the 79th congress passed a bill establishing an Indian Claims commission. This may be one of the most significant steps yet taken to right the chronic wrongs done the American Indians. Early white settlers in North America frequently claimed title to the lands of the new world by right of conquest or discovery. Later the colonists began to acquire additional land through negotiation and purchase from the Indians. This gradually became the basic policy of the colonial governments, and ultimately of the federal government. However, treaties signed with Indians were subject to confirmation by the senate and sometimes the senate failed to confirm a treaty negotiated by government representatives. When this occurred it was most unfortunate because the whites had usually moved in and taken possession of the land at the conclusion of the treaty-making and when the senate failed to confirm the treaty they would not give the land back, so the Indians were without their land and without any compensation for it. They could, of course, appeal to congress for justice and obtain a jurisdictional act permitting them to sue the government in the court of claims. In every session of congress many such claims bills are introduced and the Indian population is in a continual turmoil as to whether their claims will be recognized. The effect of the new claims bill is to provide an opportunity for the adjudication of all existing claims without any further enabling legislation.

The supreme court settled two land controversies during the year. The Quillehute Indians of Washington state had their title to tidelands and the bed of a river flowing through their reservation confirmed on Oct. 25. The decision restrains the state of Washington from interfering with their exclusive right to fish in this stream. The Alsea band of Tillamook Indians, also of Washington state, was on Nov. 25 declared entitled to compensation for lands arbitrarily taken from them without payment. The amount of compensation had not yet been fixed.

Returning Indian veterans were demanding further educational facilities, the right to vote, in a few states in which they

were still denied the ballot, and an amendment in the Indian Prohibition act which would permit the sale of liquor to Indians off the reservations. North Carolina permitted its Indians to vote in the November election for the first time in many years. Bills were before congress covering the modification of liquor control desired. Many Indian veterans were enrolled in advanced vocational schools and colleges and approximately a thousand had returned for specialized training to Indian vocational schools.

A complete regionalization of Indian service administration was put into effect during the year. A new congressional act permits the secretary of the interior to delegate many powers heretofore exercised by him to the commissioner of Indian affairs and certain of his subordinates. Under this new decentralization, district offices were established at Billings, Mont.; Minneapolis, Minn.; Phoenix, Ariz.; Portland, Ore.; and Oklahoma City, Okla. (W. W. B.)

Industrial Health. The developments in 1946 that seemed destined to modify in considerable degree the future course of industrial health were the use of atomic energy and the greatly increased emphasis on health and welfare in employment contracts.

The ways in which atomic energy could be successfully harnessed as a source of power in manufacturing and transportation were unsettled, although new facilities were built and personnel employed to explore the possibilities thoroughly. In other industries medical service was highly desirable—in the production of nuclear energy it was indispensable. The manufacture of atomic bombs appeared to demonstrate that this form of energy could be produced safely if suitable safeguards were employed. However, the techniques essential for safe manufacture were so exacting as to narrow seriously the field of practical application. It was thought that it might be easier to create "health physicists" rather than try to train physicians in the technical complexities of nuclear fission. The physical effects of atomic radiation were under intensive investigation. During the year several deaths occurred and claims in substantial amounts for damages attributed to harmful exposure to atomic radiation began to appear.

Industrial physicians, safety directors and management were impressed with the changing status of the health and welfare of workers as exemplified in the national bituminous coal mines wage agreement between the U.S. government as coal administrator and the United Mine Workers of America. Traditionally, management had always assumed the principal burden of support and direction of industrial health and safety programs. The coal mine employment contract provided for a considerable degree of direct participation by labour in these directions. A new safety code was drawn up providing for federal as well as state mine inspection. Mine safety committees elected by local unions were stipulated, having power of inspection of dangerous conditions. Recommendations of these committees were binding on mine owners unless these powers were conspicuously misused. Mine owners could no longer elect to come under state compensation laws. All, no matter how small, must provide this protection to the workers. Wage deductions for medical and hospital care formerly administered by the employers, were to be administered entirely by a board of trustees appointed by the president of the United Mine Workers. A welfare and retirement fund created by a five-cent royalty on each ton of coal produced was to be managed by three trustees—one appointed

by the coal mines administrator, one by the president of the United Mine Workers and the third chosen by the first two. This fund had definite medical care implications, mainly in the direction of compensation for sickness or disability not otherwise provided for under federal or state laws. Provision was also made for co-ordinating the use of these two funds. Finally, a comprehensive survey of medical and sanitary conditions was ordered with a view toward bringing medical care, housing and public health practices up to recognized U.S. standards. The terms of this agreement defined more clearly than ever before the basic issue of greater labour participation in plans for the health and welfare of workers and strongly implied that safety and health would be important factors in all future collective bargaining. Full implementation of these terms had necessarily to await the return of the mines to the owners who continued to resist some of the recommended changes. Likewise, impending labour legislation was thought likely to modify some of these relationships. The medical profession indicated a sympathetic view toward all bona fide efforts to improve working and living conditions. The American Medical association approved the general policy of co-operative industrial health planning by management, labour and medicine, provided scientific and ethical standards were preserved.

Public law 658 was enacted by the 79th congress. This was an act to provide certain health services to federal employees, to include emergency medical care, pre-employment and periodic physical examinations, control over working environment and health counselling. Under this legislation the U.S. public health service was instructed to draw up and administer general standards for this health program. However, actual administration was an independent function of the affected federal agencies. Several million civil service employees were affected by these provisions.

The division of industrial hygiene in the U.S. public health service completed its reconversion from a war to peacetime status. Improved efficiency was assured through reorganization of its field activities and states relations. Research facilities were re-established in the division of industrial hygiene itself and current appropriations for the U.S. public health service funds were for the first time specifically earmarked for industrial hygiene services.

The demand for qualified physicians and technicians in industry remained active and, in fact, exceeded the supply. An Institute of Occupational Medicine and Hygiene was established at Yale university specifically aimed to develop a training program in recognition of the specialized status of industrial medicine, to promote teaching at a graduate level for physicians, nurses, engineers and public health administrators, to provide opportunities for research and to develop a consultation service to industry. Similar teaching and research programs were being developed at Wayne, New York and Columbia universities. Medical educators took the view that the functions of the physician in industry were moving toward social medicine rather than remedial services, and that specialization would need to be governed by this trend. The American Foundation of Occupational Health was created to advance the cause of medical education, mainly through fellowships in universities and affiliated medical departments and through research. The American Academy of Occupational Medicine was formed to provide the means for interchange of experience, to promote standards of industrial medical service and to foster better industrial medical education.

The charter of the World Health organization as adopted in 1946 contained no specific reference to the health of industrial workers. It was expected that a mixed committee would be appointed consisting of public health experts and others to consider social insurance and industrial hygiene. Reciprocal rela-

tions set up between the World Health organization and the International Labor organization indicated that the latter agency would continue its former objectives and functions. Its division of industrial hygiene was re-established under competent medical direction after a lapse of several years. The safety division was returned to Geneva in preparation for the resettlement of the entire Industrial Labor organization in its old original quarters.

(C. M. Pn.)

Great Britain.—During 1946 the most significant development in British industrial medicine was its recognition as a specialized branch by the decision of the Society of Apothecaries and the Royal Colleges of Physicians and Surgeons to grant diplomas in industrial health. The granting of these diplomas together with the establishment of chairs and readerships in social medicine and industrial medicine proceeded *pari passu* with an increase in the number of doctors and nurses engaged in industrial medical practice and nursing. Industrial nursing was the foundation of good industrial medicine and both the University of Birmingham and the Royal College of Nursing continued to grant their certificates in industrial nursing and other universities might grant diplomas or certificates in the future.

Research both in clinical toxicology and in industrial health was carried out by the Medical Research council and the Industrial Health Research board. During the year reports on investigations were published in the *British Journal of Industrial Medicine* and in the special report series of the Industrial Health Research board. Important among these reports is that of Dr. L. Colebrook on "Artificial Sunlight Treatment in Industry" (*Industrial Health Research Board report No. 89*). This report cleared up a number of difficult points which had arisen as a result of the popular use of ultra-violet light. Among important clinical reports were "Chronic Mercury Poisoning" and "Bronchiolitis Resulting from the Handling of Bagasse" (*British Journal of Industrial Medicine*, Vol. 3, No. 2, April 1946). In research carried out in industry itself excellent work was done by Dr. T. A. Lloyd Davies on manganese pneumonitis (*British Journal of Industrial Medicine*, Vol. 3, No. 3, July 1946).

In addition to these reports attention must be paid to the *Annual Report* of the chief inspector of factories for 1945. In this the senior medical inspector of factories, Dr. E. R. A. Merewether, reviewed briefly the years of World War II, and for the first time after 1939 statistics relating to the incidence of scheduled diseases were given in detail.

Problems relating to the rehabilitation of the sick and injured developed on an extensive scale during World War II and received further impetus by the formation of the British Council for Rehabilitation and by the fuller application of that great humane act known as the Disabled Persons Employment act (1944). During 1946 the number of disabled persons to be employed in industry was increased from 2% to 3% and a start was made in the setting up of government-established factories designed purely for the employment of certain sections of disabled persons. In the resettlement of former servicemen many of the difficulties anticipated had not arisen and the wider picture showed that the former servicemen settled down satisfactorily into his industrial life. Industrial Production: see BUSINESS REVIEW; CIVILIAN PRODUCTION ADMINISTRATION.

Infantile Paralysis. During 1946, more people in the United States experienced an attack of infantile paralysis (acute anterior poliomyelitis) than in any single year after the disastrous epidemic of 1916. This was the fourth consecutive year in which the incidence of infantile paralysis was well above the average for the United States. Infantile paralysis is geographically widespread, including North and South America, Europe, Africa, Australia, Philippine Islands, Japan and Asia.

The history of infantile paralysis indicates a transition from a disease of infrequent, sporadic and dispersed character to that of an epidemic disease. This transition occurred during the 1870s in Scandinavia, during the 1880s in Europe, during the 1890s in the northern United States, during the 1930s in the southern United States and during 1938 and 1940 in Japan. While infantile paralysis was sporadic and during the early years of its epidemic phase, the disease was essentially one of very young children; whereas, after some years as an epidemic disease, infantile paralysis more commonly attacked people during their later childhood, their adolescence, and even during their adult life. Up to 1947 an explanation was not offered which accounts fully for this change in the character of the disease.

Whereas reports were not complete, it would appear that in

SISTER ELIZABETH KENNY, noted for her hot pack method of treating infantile paralysis, working on a young victim of polio in 1946 at the Kenny Infantile Paralysis institute in Minneapolis, Minn.

the United States the epidemic of 1946 was characterized by an unusually large number of bulbar cases affecting the higher centres of the spinal cord and by the frequency with which pregnant women contracted this disease. One investigator drew attention to his observation that women contracting the disease during the first trimester of pregnancy usually were carrying a male foetus, whereas those contracting the disease during the third trimester of pregnancy were usually carrying a female foetus.

The epidemic of 1946 afforded an opportunity to study in one institution large numbers of patients with the bulbar form of infantile paralysis. After careful study it was concluded that the following were strongly contributory to the death of the patient, a consequence frequently associated with this form of the disease: (1) an accumulation of thick viscous mucus in the respiratory passages with subsequent blockade of the pathways for air, a result both of increased secretion of mucus and of the inability of the patient to swallow and cough; (2) an accumulation of fluid within the lungs, brought about in part at least by the high negative pressure within the lungs caused by breathing in a respirator against partial obstruction of the respiratory passages; and (3) incomplete oxidation of the blood, due partly to inadequate aeration because of an accumulation of fluids within the lungs. It was believed that once established any of these changes induce a self-perpetuating vicious cycle of progressive seriousness, resulting in further injury to already damaged nerve cells and not infrequently culminating in death of the patient.

The following regimen was instituted in order to combat positively the conditions so often a consequence of the bulbar form of the disease: (1) tracheotomy, an open tube placed into the windpipe, was performed early in the course of the disease, (2) respiration was carried on by means of a positive-

pressure mechanism attached to the tracheal tube, (3) the inspired air was changed to a mixture of oxygen and helium and (4) the percentage of oxygen in circulatory blood was determined continuously by means of a special photoelectric cell attached to the ear.

Intensive studies of numerous outbreaks of the disease yielded no information to indicate that, except for rare instances, the disease is spread in any other manner than by intimate contact between a susceptible person and some person harbouring the virus. The difficulties encountered in tracing the exact source of the infection for any single victim of the disease is illustrated by the probability that, for every diagnosed case of infantile paralysis, there may be up to 100 persons who have the infection in some unrecognized form, and from whom the virus could be recovered in laboratory tests.

It should not be unexpected that adherents of the theories that the disease is transmitted by food, water and/or insects would use for support of their favoured theory a report that as little as one-tenth of a gram of the faeces of a victim of the disease might contain enough of the virus to infect a monkey. Whereas it was conceivable that such quantities of infected faeces might, under certain circumstances, contaminate food, water and/or insects, this in itself offered no real evidence that the disease might be transmitted by these means. This problem, the means by which the disease is transmitted, could not finally be resolved until there had been developed a more sensitive test for the virus—preferably a test so sensitive that it would reveal the presence of a single virus particle.

Reports were published during 1946 on the value of curare in the treatment of infantile paralysis. These reports were contradictory in nature, and in no case was there performed a critical experiment which included an adequate number of cases and in which there was exercised proper precautions for controls.

Studies on the relationship of certain enzyme systems of nervous tissue to resistance of nerve cells to the virus of poliomyelitis continued. While none of these studies pointed toward a practical means of control for the disease, the results up to 1947 were of great potential value and were most provocative of further work. (See also EAR, NOSE AND THROAT, DISEASES OF; EPIDEMICS AND PUBLIC HEALTH CONTROL; NERVOUS SYSTEM.)

(H. M. Wr.)

Infant Mortality. There was a moderate decrease in infant mortality from 1945 to 1946 for the United States, bringing the rate to the lowest yet recorded for the country; provisional records for the first 11 months of both years indicate a reduction in the infant mortality rate of 3.2%. For the latest year of complete record, 1945, there was reported a total of 104,684 deaths under 1 yr. of age; since 2,735,456 births were registered, the infant mortality rate for the year was 38.3 per 1,000 live births. This is less than one-third of the infant mortality rate prevailing in the U.S. at the beginning of the century.

Quite a substantial decrease in infant mortality was indicated for England and Wales, according to provisional reports for the first 11 months of 1945 and 1946 from London and the large towns; these reports indicate that the improvement was 15%. Deaths under 1 yr. of age in England and Wales as a whole totalled 31,961 during the entire year 1945; the infant mortality rate was 46.7 per 1,000 live births. Canadian reports for 1945, the latest of record, show 14,741 deaths under 1 yr. of age and an infant mortality rate of 51.1 per 1,000 live births. For the same year, 1945, Chile reported an infant mortality rate of 185 per 1,000 live births, a rate practically the same as the year before, and Australia reported 29 infant deaths per 1,000

live births, somewhat less than the preceding year's record; data for 1945 from other countries were not yet available at the close of 1946. Comparable infant mortality rates for 1943 and 1944 for several countries are shown in Table I.

Table I.—Deaths Under One Year of Age Per 1,000 Live Births, 1944 and 1943

Country	1944	1943	Country	1944	1943
Argentina	80	78	Netherlands	—	41
Australia	31	36	New Zealand (white)	30	31
Belgium	77	67	Nicaragua	113	100
Bulgaria	121	130	Palestine	87	96

Costa Rica	125	117	Puerto Rico	99	96
Denmark	48	45	Scotland	65	65
Ecuador	134	136	Switzerland	42	40
England and Wales	46	49	Union So. Africa (white)	42	48
France	77	75	United States	40	40
Ireland	79	80	Venezuela	117	109

Within the United States, 5 states had infant mortality rates of less than 30 per 1,000 live births during 1945; lowest of all was Rhode Island (28.2), followed in turn by Nebraska (28.5), Oregon (28.7), North Dakota (29.3) and Connecticut (29.9). On the other hand, 4 states had infant mortality rates of 50 or more; highest of all was New Mexico, where the rate was 100.8. The sequence in decreasing order from New Mexico downward was Arizona, West Virginia and Colorado. It will be noted that all but one of the states with the highest rates are in the southern tier of the country, while those with the lowest rates are in the northern tier.

Particulars regarding infant mortality rates for the United States according to sex, race, age and principal causes of death are shown in Table II; the data are shown for each year from 1940 to 1944. In the latter year, the infant mortality rate for

Table II.—Infant Mortality per 1,000 Live Births, According to Sex, Race, Age and Cause of Death; United States, 1940–44

Characteristic	1944	1943	1942	1941	1940
Total	39.8	40.4	40.4	45.3	47.5

Coloured	60.3	62.5	64.6	74.8	73.0
Total by age					
Under 1 day	11.5	11.6	12.3	13.2	13.9
1–2 days	5.4	5.2	5.4	5.7	5.7
3–6 days	3.1	3.1	3.1	3.4	3.6
1–3 weeks	4.8	4.7	4.8	5.4	5.4
1–2 months	5.2	5.3	5.2	6.1	6.4
3–5 months	5.0	5.0	4.7	5.7	5.9
6–8 months	3.1	3.2	2.9	3.5	3.6
9–11 months	1.9	1.9	1.9	2.3	2.4
Total by cause of death					
Premature birth	11.9	11.8	12.3	13.3	13.7
Pneumonia and influenza	5.6	6.2	5.7	6.6	7.4
Congenital malformations	5.1	4.9	4.9	4.7	4.7
Injury at birth	3.6	3.7	4.1	4.3	4.5
Diarrhoea and enteritis	3.3	3.0	2.8	3.7	3.5
Congenital debility9	.9	1.0	1.1	1.2
Whooping cough5	.8	.6	1.0	.9
Dysentery4	.3	.3	.4	.4
Syphilis3	.3	.3	.4	.5

males was 44.1 per 1,000 live births, considerably higher than the corresponding rate of 35.2 for females. The white population had an infant mortality rate of only 36.9 per 1,000 live births, in contrast to rates of 59.3 for Negroes and 80.8 for other coloured races, making an average of 60.3 for coloured races generally. However, the improvement in infant mortality after 1940 was at a relatively more rapid rate among the non-white population than among the white population.

Each age period within the first year of life shared in the general improvement in infant mortality after 1940. An interesting point to observe, in the table, is the steady decrease in the rates for the first day of life; the later periods within the first year of life, on the other hand, showed no improvement from 1942 to 1944. As in prior years, premature birth was by far the outstanding cause of death in infancy during 1944, the rate being 11.9 per 1,000 live births; pneumonia and influenza was second in rank with a joint rate of 5.6, followed in turn by congenital malformations with a rate of 5.1 and

injury at birth with 3.6. (See also DEATH STATISTICS.)

Ingram, Arthur Foley Winnington (1858–1946), British prelate, was born on Jan. 26 in Worcestershire. For his early career see *Encyclopædia Britannica*. He was Anglican bishop of London, 1901–39, and held the third highest rank in the church of England, superseded in authority only by the archbishops of Canterbury and York. He enjoyed wide popularity in London's East End, where he had engaged in social work for some 50 years. He wrote many works on religious subjects, among them *What a Layman Should Believe* (1938), which interpreted the church of England report on doctrine from the viewpoint of the "high" church; *The Secrets of Happiness* (1939) and *Fifty Years' Work in London* (1940), which described his activities in the East End. He died in Upton-on-Severn, Worcestershire, on May 26.

Institutum Divi Thomae. The Institutum Divi Thomae is the graduate school of science of the Athenaeum of Ohio, Cincinnati. During 1946 perhaps the most interesting research publications from the Institutum Divi Thomae were in the fields of cancer, of tissue extracts as anti-infectious agents and of the mode of action of organic mercurial antiseptics.

Based upon earlier experimental work in the Institutum laboratories, a collaborative research program was undertaken with the skin and cancer unit of the Post-Graduate Medical School and Hospital, New York, for the treatment of human basal cell epitheliomas (skin cancer) by the injection of tissue extracts derived from both human and animal sources. A considerable degree of success attended these treatments within the four-year observation period covered by the published reports. These studies are of particular interest because they represent the use of a nondestructive agent rather than the use of destructive methods such as radiations or surgery.

For several years the investigation of animal tissues as sources of antibiotic or anti-infectious agents had been in progress. It had been found that certain of these extracts are effective *in vitro* against a number of organisms, including *Streptococcus pyogenes*, *Mycobacterium tuberculosis* and *Staphylococcus aureus*. For the last-named organism, brain extracts in particular have a very high degree of effectiveness in animal infections, being active against strains of *Staphylococcus aureus* which are resistant to penicillin. Unlike the antibiotics derived from micro-organisms, the tissue extracts do not inhibit the growth of staphylococcus but convert it to an avirulent form.

Studies of the germicide, phenylmercuric nitrate, demonstrate that it inhibits the activity of a number of enzymes as well as the over-all respiration of living cells. Its toxicity for some enzymes and cells can be prevented by the addition of compounds like cysteine and glutathione containing sulfhydryl groups with which the mercurial can react. These findings

present an analogy to some of the wartime studies on BAL (British anti-Lewisite) carried on in laboratories in the United States and England.

In extending the Institutum's system of affiliated laboratories, a new unit was opened in 1946 at the College of Chestnut Hill, Chestnut Hill, Pennsylvania. (E. S. C.)

Insulin: see DIABETES.

Insurance. **Life.**—At the end of 1946 the total life insurance (excluding reinsurance) in force in the legal reserve life insurance companies of the United States and Canada was estimated at approximately \$182,500,000,000, about 11% more than 1945. New issue during 1946 totalled about \$25,000,000,000, nearly 50% more than 1945 and a new all-time record. Assets of the companies at the end of 1946 amounted to \$52,000,000,000, after paying or crediting to policyholders and beneficiaries about \$3,000,000,000 during the year.

Mortality in the U.S. during the first nine months indicated that 1946 would set another low record. Death rates from influenza and pneumonia were up early in the year but favourable experience in later months largely offset the increase. Motor accident fatalities unfortunately rose sharply after driving restrictions were lifted at the close of World War II. A final estimate of war claims for the four war years showed that \$200,000,000 was paid by the life insurance companies of the United States for deaths resulting from combat action. Claims on deaths of military personnel from disease and accidents totalled \$113,000,000. Altogether, war claims amounted to about 6.7% of all death benefits paid.

During World War II government securities provided the chief outlet for the investment of life insurance funds. From Pearl Harbor through the Victory Loan campaign in 1945 U.S. companies had added \$15,000,000,000 net to their holdings of federal and dominion government bonds.

Following World War II some federal debt was retired and some refunding accomplished with short-term securities. Corporate flotations increased, still largely refundings, but most of the new capital was stock rather than bonds. Revival of private building began to reopen the field for mortgage investment.

In contrast to the war period government securities held second place in life insurance companies' new investments in 1946. About \$1,000,000,000 was added to their holdings of federals and dominions—only one-fourth as much as in 1945. However, government securities still represented nearly half their assets. Corporate securities, taking first place, were up more than \$2,000,000,000, of which about four-fifths were industrials.

Holdings of urban mortgages increased \$300,000,000. In addition to direct investments in housing, companies began to acquire certain other urban income-producing real estate for investment. This was a departure for eastern companies, permitted by laws passed in New York, New Jersey and Connecticut.

Open market yields on high-grade, long-term investments reached all-time lows early in 1946, but then rose a bit. Reflecting continued low yields on new investments, the interest rate earned on life insurance companies' assets continued downward.

Following a decision of the U.S. supreme court in June 1944 which declared that the business of insurance was commerce, congress enacted a statute which declared that "the continued regulation and taxation by the several states of the business of insurance is in the public interest, and that silence on the part of the Congress shall not be construed to impose any barrier to the regulation or taxation of such business by the several states."

This statute further declared that no act of congress should be construed to invalidate, impair or supersede any law enacted by any state for the regulation of the business of insurance, or which imposed a fee or tax upon such business unless the law specifically related to the business of insurance.

The statute further provided that after Jan. 1, 1948, the Sherman act, the Clayton act and the Federal Trade Commission act should be applicable to the business of insurance only to the extent that such business was not regulated by state law. In the meantime such acts were not to apply to the business of insurance except as to agreements to boycott, coerce or intimidate.

The validity of the tax laws in force in certain states which imposed different premium taxes upon foreign and domestic companies, that is, discriminatory taxes, was subsequently challenged. In June 1946, the supreme court of the United States, under the statute referred to above, upheld the South Carolina statute which levied a premium tax on out-of-state companies but none at all on its own domestic companies. By another decision on the same day the court, without relying on the statute in question, sustained certain regulatory statutes of the state of California.

BIBLIOGRAPHY.—*The Spectator (Life) Insurance Year Book (1946)*; Report of the Superintendent of Insurance of the Dominion of Canada, Vol. II, Life Insurance Companies (Ottawa, Ont., 1946.) (L. A. L.)

Automobile.—Automobile accident frequency increased tremendously during 1946 and the cost of resultant claims also was up substantially, the result being that practically all companies had a very unprofitable year and, for the first time, rates were increased twice within a 12-mo. period. This increase, coupled with the fact that many states adopted financial responsibility laws, substantially increased the volume of automobile insurance written. (F. M. R.)

Blue Cross.—Membership in nonprofit Blue Cross plans for hospital care reached 24,390,763 on Oct. 1, 1946, an increase of 4,401,558 during the first 9 mo. of the year. Growth broke all previous records, exceeding the net gain for the entire year 1945 by Aug. 1. Indications were that membership in the 87 plans approved by the American Hospital association would approach 26,000,000 by the end of the year—more than 20% of the population of the United States. Rhode Island, 65% enrolled, led all states in percentage of population covered. A survey showed 1,637,533 rural residents were Blue Cross members on July 1.

One new plan, covering Idaho, was approved, bringing to 44 the number of states served by Blue Cross, in addition to 7 Canadian provinces and Puerto Rico. Negotiations were under way for establishment of plans in the four states not served—Arkansas, Mississippi, South Carolina and Wyoming. (A. G. S.)

Accident and Health.—The marked expansion of accident and health insurance continued in 1946 with a 15% gain in premiums, bringing the total to more than \$675,000,000. Claims, on individual policies, abnormally low during World War II, increased slightly. Group insurance continued to show gains while claim experience improved somewhat as employment continued high. Considerable controversy developed among various elements in the business over the need for close state rate regulation. Occupational hazard rating-classifications were being studied in view of the many changes after the last revision in 1937.

A U.S. chamber of commerce report on 1945 figures estimated that 5,928,333 employees were covered by private group accident and health insurance, about 12,000,000 by self-administered plans and 8,640,000 by individual policies. (See also SOCIAL SECURITY.) (C. D. Sp.)

Great Britain.—Motor insurance and employers' liability coverage provided the bulk of the increased volume of business transacted during 1946. Personal accident coverage was in demand on the growth of civil aviation; the upswing in burglary premiums reflected the pressure of inflation and the desire for protection because of the postwar crime wave. Motor underwriters bridged a gap in the law by voluntarily setting up a pool from which victims of uninsured motorists would be compensated. The cost of claims, especially motor vehicle, third-party and burglary, tended to rise. (P. Ss.)

Fire.—The most pressing problem before the business of fire insurance for 1947 was the development by each state of a series of laws for the control of the business, commencing Jan. 1, 1948, which would be satisfactory to the U.S. government. On the date mentioned a breathing spell, so to speak, granted after the Atlanta decision of 1943 was to expire and unless the states by that time had adopted satisfactory laws for the control of the business—and this meant satisfactory to the U.S. government—then the government would intervene and supply the missing laws to the extent that they seemed to lack what the U.S. government considered necessary for the proper operation of the business.

According to the *Insurance Year Book, 1946*, published by the Spectator Company, the premium receipts did not materially change from the previous year. The premiums from all the lines written by the fire insurance companies amounted to about \$1,252,000,000 plus. These, it should be known, were the receipts from all forms of insurance written by the fire companies. The receipts for fire insurance alone were \$671,000,000 plus. The losses paid for all lines of insurance were \$625,000,000 plus or just about 50% of the premium receipts for all lines. For fire insurance alone the losses were \$316,000,000 plus or 48%. The other sources of income—rent, interest, dividends, etc.—amounted to \$105,000,000

plus. (See also FIRES AND FIRE LOSSES.)

(E. R. H.)

War Damage.—In view of the substantial discontinuance of public demand for war risk insurance in the United States and its territories and possessions after the cessation of hostilities, issuance of new policies of insurance by War Damage corporation was discontinued on March 15, 1946. Existing policies, which had been extended without payment of additional premiums in 1944 and 1945, were not further extended. Insurance effected between March 1 and March 15, 1946, was limited to a term expiring not later than Jan. 22, 1947.

On April 30, 1946, congress terminated the authority of War Damage corporation regarding damage to property in the Philippine Islands. Pursuant to the provisions of the Philippine Rehabilitation act of 1946 the corporation had transmitted all its Philippine claim files to the newly-created Philippine War Damage commission.

On Aug. 9, 1946, War Damage corporation announced that all claims for free compensation for loss of, or damage to, property in the territories and possessions of the United States must be presented to the corporation before Oct. 16, 1946.

Because of the automatic extension of insurance in 1945 and termination of the insurance program in 1946, there were very few policies written during the calendar years 1945-46. The net income of the corporation from premiums during the year ended June 30, 1946, was \$119,076.84.

During the 11 mo. ended Nov. 30, 1946, War Damage corporation paid 1 claim, aggregating \$193.50 under its premium insurance program and 560 claims aggregating \$145,024.99 under its free program. Most of such claims for free compensation were presented by former civilian employees of contractors at naval air bases on Wake Island and Guam. These persons were captured by Japanese forces in Dec. 1941, interned in China and Japan and repatriated to the United States in 1945 and 1946.

The corporate life of War Damage corporation, if not extended was to expire on Jan. 22, 1947, except for purposes of liquidation. (G. E. A.)

Great Britain.—The cumulative effect of war damage on land was shown in financial statements issued by the government in regard to the various war damage schemes. Under the "business," "commodity" and "private chattels" schemes, the financial position on March 31, 1945, was: premiums £296,000,000; claims and expenses £302,000,000. About 17,500,000 policies were issued and 2,275,000 claims received. In addition, 20,000,000 persons received free cover under the private chattels scheme.

No final estimate of war damage to buildings was issued. About 3,000,000 properties were damaged and 200,000 properties totally destroyed. Contributions under this section of the War Damage act were estimated to yield £200,000,000, but considerably more than this amount had already been absorbed by war damage payments and the exchequer would be heavily drawn upon.

Receipts for the private chattels scheme for the year ended March 31, 1946, amounted to £11,241 and payments to £16,076,476. Outstanding claims were estimated at £4,000,000. Receipts for the business scheme amounted to £33,492 and payments to £3,863,250. Outstanding claims were estimated at £4,500,000. Deferred payment noted for the private chattels scheme was £29,500,000, and for the business scheme £60,291,000. (P. Ss.)

Marine and War Risks.—The premium income from marine risks continued up. This, however, was largely because of the surcharges, which were instituted during World War II, being carried on. If it were not for these surcharges unquestionably the whole marine underwriting picture would have been disastrous. The conditions of navigation were still far from normal. Port facilities were smashed in many parts of the world, and losses as a result of exposure after discharge were heavy. Especially were the losses very great as a result of a world-wide epidemic of thefts and pilferages which in many ports assumed the proportions of organized looting.

The year saw very little change in basic marine rates but the surcharges were subject to various reductions as conditions warranted, even in spite of the lack of improvement in overseas packing.

The wave of strikes, especially those in the U.S., had a paralyzing effect on overseas trade and the great merchant marine of that country was brought to a standstill for long periods several times.

As to the hull market, the year saw the return of a vast amount of government-owned or controlled tonnage to private operation—even some of the great passenger liners. This naturally provided a considerable amount of premium which theretofore had, as a result of government control, passed out of the hands of private underwriters. This transfer of ships back to owners continued. (See also VETERANS' ADMINISTRATION.) (H. C. Tn.)

Inter-American Affairs, The Institute of.

During 1946 the Institute of Inter-American Affairs carried on certain functions of the former Office of Inter-American Affairs, which in turn succeeded to the Office of the Coordinator of Inter-American Affairs. The office was the United States government agency for helping to develop and co-ordinate the western hemisphere's productive and economic power in support of the United Nations. The continuing peacetime mission of the two government corporations is the promotion of better conditions of health, sanitation, food supply and distribution, education and transportation in the other American republics.

An executive order of Aug. 16, 1940, created the Office of Inter-American Affairs, with Nelson A. Rockefeller at its head, as co-ordinator. During 1943 the Inter-American Educational foundation was organized by the office, for the purpose of developing a comprehensive co-operative educational program with the other American Republics. An executive order of President Truman, May 20, 1946, terminated the Office of Inter-American Affairs, a normal process in the government's reconversion program. The major continuing functions of the office were carried on by the two succeeding government corporations—the institute and the educational foundation. They are under the general jurisdiction of the department of state, and are directed by a common president.

The major projects of the institute in 1946 were in the fields of health and sanitation; food supply; a training division and transportation. The educational foundation continued to emphasize co-operative programs with the other American republics in vocational and health education; the training of teachers; the improvement of rural life and agriculture; the development of community schools and the teaching of the English language.

The transportation division, which did especially important war-winning work, in 1946 had virtually completed its program, as far as the parent body, the institute, was concerned. However, the railroad, highway and other transportation improvements which it started would be carried on, it was hoped, by the governments of the various other American countries concerned.

One of the most ambitious and effective transportation projects was among those closed during 1946. This was the United States Railway mission to Mexico, which was a prime factor in the rehabilitation of the Mexican national railroads. These railroads were unable to bear the strain of wartime traffic—because of complicated factors which had developed during many preceding years. And yet, the United States and its Allies had to have vital war materials from Mexico. The Railway Mission with all-out Mexican co-operation made possible the flow of vital supplies from and through Mexico—and, with Mexican technicians, paved the way for continuing future improvements of that country's rail lines.

Under the health and sanitation division, joint inter-American co-operative health programs were set up with both immediate and long-range objectives. The first was to speed and insure the ultimate military victory of the Allies by safeguarding the health of Latin-American workers producing vital war materials, and also protecting the health of troops stationed in strategic areas throughout the Americas. The long-time purpose, of course, is the continued elevation of health standards in the hemisphere. The process is obvious—better health resulting in greater productivity, higher levels of living and an expanding economy in all the Americas.

These health and sanitation programs, thoroughly co-operative and democratically organized, are known popularly in most Latin-American countries as "servicios." Their title is "Servicio Cooperativo Inter-americano de Salud Publica," or Inter-American Public Health Service—which is usually abbreviated to S.C.I.S.P.

Each "servicio" is organized within the framework of the government of the country where it functions, usually under the health ministry. In the beginning, the United States and the host government each contributed a share of the money, materials and trained men and women needed for the work. The direction of activities and expenditures of the pooled funds is decided jointly by the chief of party of the institute, and an appointee of the co-operating national government.

With the rephrasing of agreements as stages of the work were passed, the participating Latin-American countries increased

their proportion of the funds. By 1946 most of them put in more money than did the United States—one South American country ten times as much.

During 1946 there were about 10,900 health engineers, nurses, other technical personnel and unskilled workmen, engaged in the operations of the servicios, with some 130 of the co-operating technicians from the United States.

The training division is a potent factor in all the projects. It deals with the long-range program of providing staffs of national technicians to carry on the public health and sanitation activities in each country after expiration of the co-operative programs. Most of these programs were scheduled to terminate in 1948.

In the field of food supply, that division's direct concern with the winning of the war shifted to peacetime operations for basic improvements of conditions which, ultimately, would improve the level of living and increase the people's purchasing power.

Inter-American Educational Foundation.—The Inter-American Educational foundation had been active in all 20 of the other American republics. During its first two years, the foundation sent 21 specialists in vocational, health and rural education, and in teacher training and English teaching to the other American republics. About 30 more went during 1946. Altogether, between 500,000 and 600,000 books, pamphlets, charts and other teaching materials were made available to the field parties. About 60 distinguished educators were brought to the United States for lectures, study and other participation in the educational life of that country. (A. R. Hs.)

Inter-American Defense Board. During 1946 the Inter-American Defense board held 17 plenary sessions, at some of which reports were given on latest weapons and future developments. The previous recommendations of the board in reference to the standardization of the training, organization and matériel of the armed forces of the American republics served as one of the bases for the proposal for legislation—"The Inter-American Military Co-operation act"—submitted by the president to the congress of the United States with his message of May 6, 1946. Looking toward establishing on a permanent basis the military co-operative measures carried out by the American republics during World War II, and in conformity with Resolution IV of the Inter-American Conference on Problems of War and Peace, held at Mexico City in 1945, the board prepared and forwarded to the governments of the American republics a proposal for the creation of a permanent military agency to succeed the board and to be known as the Inter-American Military Defense council. It was expected that this proposal would be submitted to the next conference of American republics. Staff committees of the board were engaged in new studies of hemisphere defense problems.

The board is an autonomous international organization created in March 1942 in accordance with resolution XXXIX of the third meeting of the ministers of foreign affairs at Rio de Janeiro. It includes military, naval and air delegates from each of the American republics, and is charged with studying and recommending measures for the defense of the hemisphere. The board's offices and conference rooms are in the new War department building, Washington. Lt. General M. B. Ridgway, U.S.A., replaced Lt. General S. D. Embick, U.S.A., as chairman in March 1946. MODERN BEDROOM displayed at Marshall Field and company in Chicago, Ill., during 1946. Beige and yellow were the dominant colours

Interior Decoration.

The year 1946 was remarkable in the United States as elsewhere for highly urgent mass demand for materials that make and furnish homes. The impact of this pent-up demand upon extremely slender supplies was dramatic. In the United States the unavailability of materials was a continuing surprise in view of cited full employment and undamaged means of production. Those countries which had directly experienced World War II worked hard to try to supply minimal domestic needs and to earmark as much as possible for a renascent export trade. Great Britain, in particular, made a heroic start in this direction. However, 1946 saw little export from Europe and that little, because of general inflationary pressures, was not priced for favourable competition.

In the United States new developments emerged from the planning stage to widely-advertised token production, the marginal utility of which could be measured by increasingly intense desire. In those home-furnishings exhibits which were tied to architecture the trend toward contemporary forms was marked but the rehabilitation of old period units in the housing crisis made natural a mass demand for traditional furnishings as well.

Interior Surfaces.—The most prevalent and inexpensive wall treatment was paint in light matt tones but there was a tendency toward rather dark walls offset by bright slipcovers or upholstery. Paints improved through wartime experimentation became available. These included casein paints with gloss finish, luminous paints and paints with increased covering quality and purer stronger colours. Interest in wallpaper was stimulated by advertisements of new plastic-coated papers and by displays of machine-made paper, production of which increased slightly by midyear. Paper designs ranged from neoclassic to rococo but modern oversized floral patterns were stressed, many on dark backgrounds. Plain papers matching background tones were available and a number of papers were developed to match textile designs in glazed chintz. Some papers were highly lustrous. Design competitions and the employment in some instances of notable designers improved standards. Textiles with decorative value were used as wall hangings, and tile and brick were employed in contemporary informal interiors. Interior trim generally was painted to blend into adjoining wall tones or in light shades. Floors were laid in hardwood or tile.

Floor Coverings.—There was a marked increase in demand for shaggy woven cotton monotone rugs and for reversible open weaves of wool or felt and linen in informal patterns made in the United States. Oriental rugs maintained their prestige for conservative interiors but these were in short supply. The com-

pletely carpeted floor was infrequently seen. Linoleum in the better grades was unobtainable because of shortage of linseed oil. Fur scatter rugs were available in limited quantity. There was token production of rugs of paper twine coated with vinyl butyral which were thick, washable, reversible and cheap; and development of Koroseal floor covering, a resilient lifetime floor covering of polyvinyl chloride, was announced in midyear. There was little importation except for a limited number of fur rugs from South America. English and French carpet production averaged about 30% of 1939 and of this about one-quarter was allocated to export at high prices.

Window Treatment, Textiles.—Windows on the whole were treated simply, often with draw curtains forming decorative textile panels against plain walls when drawn. The valance and the ruffled cottage curtain also were in style. Owing to the acute shortage of cotton and linen, plastics, rayon and other synthetic threads were widely used, frequently in bold-textured weaves. Wide usage was foreseen for textiles of mineral fibres, developed during World War II as a Kapok substitute. A noteworthy stimulus to textile design was the fabric competition of the Museum of Modern Art sponsored by leading retail stores throughout the U.S., with guaranteed production for sale of winning designs. Toward the end of the year some very attractive chintzes and satins were available in a wide variety of colours (several with matching wallpapers). Many of these featured giant floral designs but there were also Victorian adaptations and abstract patterns. There was a trend toward dark, sometimes black, backgrounds.

Furniture.—The shortage of domestic and imported woods plus the rising manufacturing costs conspired to make furniture scarce and high-priced. There were no imports to speak of with the limited exception of French Provincial pieces from Canada. A promising development was the mass-production plan inaugurated during the year for the revolutionary contemporary plywood and metal furniture designed by Charles Eames in California. This furniture was completely weatherproof, light, comfortable, elegant and inexpensive. It was frequently impregnated with colour and consistently distinguished by sound design. The chairs had a degree of flexibility owing to the method by which their parts were joined. Less revolutionary but already well established was the functional furniture created by Artek-Pascoe, Inc., using simplified traditional structure and simple upholstery, including hides. Another interesting contemporary development was Module furniture, available in limited display in four New York stores during the latter part of the year. This mathematically-conceived furniture, each unit built in multiples of six inches, could be assembled vertically or horizontally and manipulated into different assemblies according to the plastic sense of the individual. The total line consisted of five bases, five cases, plus shelves, doors, drawers, spacers and legs, simple in form, very easily assembled and well made. Although revolutionary techniques to solve the furniture problem all were contemporary in design there remained a large demand for traditional furniture including Early American and Victorian. Antiques also found ready sale.

Lighting.—Cove and indirect lighting, a logical method for utilizing the slim line structure of the fluorescent tube, were used increasingly in contemporary interiors. There was a trend toward inconspicuous light sources, letting the light itself dramatize the decorative scheme.

Decorative Accents.—Pottery and glass, and silver to a lesser extent, were used widely as decorative accents. Pottery in particular was vigorously developed in the United States and good contemporary designers were designing for mass production. There was little importation although some porcelain and silver came from Denmark and Sweden.

Plants.—Plants continued to be a popular facet of interior planning. Large leaf plants were particularly important. Architects incorporated proper plant conditions in their plans and Frank Lloyd Wright created an indoor garden in a living room.

General.—As a direct result of crowded living conditions wall space was frequently utilized for built-in cupboards and closets, Shaker in their simplicity, which were not only useful but also invited interesting composition of panels. Large decorative screens performed the same function more casually. Blown-up photographs of natural forms or stylized compositions were sometimes used on screens, walls or stair wells.

(G. M. J.)

International Bank for Reconstruction and

Development. During 1946 there came into being two of the three principal specialized organs of world economic policy to be devised during and after World War II by the United Nations. These were the International Bank for Reconstruction and Development and the International Monetary fund. The third, the proposed International Trade organization, was still in process of discussion at the close of 1946.

The International bank was established pursuant to articles of agreement formulated in July 1944 at the Bretton Woods conference which also prepared the agreement for the International Monetary fund. These agreements on being accepted by

the requisite number of nations were declared operative on Dec. 27, 1945. The inaugural meetings of the boards of governors of the two institutions were held in Savannah, Ga. in March 1946 and the first regular annual meetings in Washington, D.C., in Sept. 1946. The bank's executive directors had been in continuous session from May 7, 1946, in Washington where the bank's principal office was located. During the year an international staff was gathered together under four principal divisions—a loan department, a legal department, a treasurer's department and a research department.

The purposes of the bank were to assist in the reconstruction and development of member nations by facilitating investment of capital for productive purposes, to promote private foreign investment by means of guarantees or participations in loans and other investments made by private investors and, when private capital was not available on reasonable terms, to supplement private investment by providing finance out of resources available to it and to promote the long-range balanced growth of international trade and the maintenance of equilibrium in balances of payments by encouraging international investment for the development of the productive resources of members. The authorized capital of the bank was \$10,000,000,000. The total of its outstanding loans and guarantees could not exceed its subscribed capital, reserves and surplus. The bank in 1946 had 40 member countries which subscribed for a total of \$7,790,500,000. The board of governors in September accepted as eligible for membership in the bank Turkey, Syria, Lebanon and Italy which had until April 15, 1947, to complete the requirements for membership.

JOINT SESSION of the boards of governors of the International Bank for Reconstruction and Development and the International Monetary fund meeting in the General Oglethorpe hotel on Wilmington Island (Savannah river), Ga., in March 1946

The subscribed capital of the bank consisted of two parts—20% to serve as the bank's working capital (half of which was called for payment during 1946 and the other half of which was called for payment in the first months of 1947) and 80% to be held and called only to make good on the bank's outstanding obligations or guarantees.

The bank could make or facilitate loans in the following ways: (1) by making direct loans out of its own funds corresponding to its unimpaired paid-up capital, surplus and reserves, (2) by making direct loans out of funds raised in the market of a member country or otherwise borrowed and (3) by guaranteeing in whole or in part loans made by private investors through the usual investment channels. Loans made or guaranteed by the bank in general had to be for specific projects or programs of reconstruction or development. In accordance with this principle the bank had to make arrangements to ensure that the proceeds of each loan were used only for the purposes for which the loan was granted. Competent technical committees appointed by the bank had to make a careful study of the merits of each proposed loan and the executive directors could not make the loan unless the committee had submitted a written report recommending it. On every loan made or guaranteed by the bank which was not a direct obligation of a member country—that is, where the loan was made to a political subdivision or a private enterprise within the country—the repayment of principal and the payment of interest and other charges had to be fully guaranteed by the member government or its central bank or some comparable agency which was acceptable to the international bank. The interest rate, other charges and schedule of principal repayment had to be "appropriate to the project," and the bank had to pay due regard to the prospects of the borrower's being in a position to meet its obligations under the loan.

The bank at the end of 1946 had received documented loan applications from France, Denmark and Chile and letters of intent not fully documented from the Netherlands, Luxembourg, Poland, Czechoslovakia and Iran. It was expected that first loan operations would be entered into in the early months of 1947.

Since by far the greater part of the loan operations of the International bank were to be made with funds raised by the sale to private investors of securities of the International bank, the bank during the latter part of 1946 gave special attention to broadening the market for its obligations and paving the way for eventual issues.

The authorities of the United States interested themselves in efforts to broaden potential U.S. markets for the obligations of the International bank and took a number of steps looking toward the legalization by the several state governments of such obligations for investment by insurance companies, commercial and savings banks, trusts and other fiduciaries. In many states this required the enactment of legislation, if possible, in the legislative sessions beginning in Jan. 1947. (*See also BANKING; TARIFFS.*) (E. G. COL.)

International Court of Justice. The charter of the United Nations provides that the International Court of Justice shall be one of the five principal organs of the United Nations; also that it shall be the "principal judicial organ," and shall function in accordance with the statute which is annexed to and "forms an integral part of" the charter. The statute of the court became operative Oct. 24, 1945, the date of the entry into force of the charter.

The 15 judges were elected by the Security council and the general assembly, at their London meeting in Jan.-Feb. 1946.

They were chosen from a list of 143 persons nominated by national groups within the respective states, members of the United Nations.

The statute provides that in electing the judges, the general assembly and the Security council shall proceed independently of each other; that they shall bear in mind not only that the persons to be elected should individually possess the qualifications required, but also that in the body as a whole the representation of the main forms of civilization and of the principal legal systems of the world should be assured.

In order to be elected, a candidate must obtain "an absolute majority of votes" in each body. Six votes were declared to constitute a majority in the Security council, and 26 in the general assembly. The statute provides that if, after the first "meeting" held for the purpose of electing judges, one or more seats remain to be filled, a second and, if necessary, a third "meeting" shall take place (article 11); and that if, after the third "meeting," one or more seats still remain unfilled, a joint conference consisting of six members, three appointed by each of the two bodies "may be formed at any time at the request of either the General Assembly or the Security Council, for the purpose of choosing by the vote of an absolute majority one name for each seat still vacant, to submit to the General Assembly and the Security Council for their respective acceptance" (article 12).

On Feb. 6, 1946, at 10.30 A.M., the Security council and the general assembly proceeded independently to elect the judges. The following 13 persons were elected on the first ballot in both bodies: Hsu Mo (China); Charles de Visscher (Belgium); Jules Basdevant (France); José Gustavo Guerrero (El Salvador); Sergei Borisovich Krylov (U.S.S.R.); Sir Arnold Duncan McNair (United Kingdom); Isidro Fabela (Mexico); Green H. Hackworth (United States); Alejandro Alvarez (Chile); José Philadelpho de Barros e Azevedo (Brazil); Abdel Hamid Badawi Pasha (Egypt); John E. Read (Canada); and Milovan Zoricic (Yugoslavia).

Thereupon the president of the Security council suggested that "the meeting . . . be suspended now until 3 o'clock this afternoon"; and the president of the assembly announced that the "session will be continued this afternoon for the election of the two remaining members of the Court." Later, on the same day, three additional ballots were taken in the council and in the assembly for the election of the two additional members of the court. The necessity for these several ballots probably resulted from the fact that each body proceeded independently of the other as required by the statute. The two additional persons who thus received the specified majority in each body, and who were therefore elected, were Helge Klaestad (Norway) and Bohdan Winiarski (Poland).

Article 13 of the statute provides that the members of the court shall be elected for nine years and may be re-elected; provided that of the judges elected at the first election, the terms of five shall expire at the end of three years and the terms of five more shall expire at the end of six years, the latter two categories to be "chosen by lot to be drawn by the Secretary-General immediately after the first election has been completed." This drawing of lots took place at the meeting of the general assembly on Feb. 11, 1946. Slips of paper containing the names of the 15 judges elected were placed in the ballot box. The president of the assembly announced that the first five names drawn would be regarded as chosen for a term of three years; that the second five names drawn would be regarded as chosen for a term of six years; and that the judges whose names were not drawn would be regarded as chosen for nine years. The first five names drawn by the secretary-general were those of Judges Zoricic, Read, Winiarski, Badawi Pasha

VIEW OF THE OPENING of the Permanent Court of International Justice at The Hague, Netherlands, in April 1946

and Hsu Mo. The second five names drawn were those of Judges Fabela, Klaestad, De Visscher, Hackworth and Krylov.

The court held its first meeting in the palace of peace at The Hague, April 3 to May 6, 1946. It elected Judge Guerrero as president; Judge Basdevant as vice-president; Edvard Hambro of Norway as registrar; and Jean Garnier-Coignet of France as deputy registrar. It prepared and adopted the rules of court (85 articles), and otherwise perfected its organization. It also prepared recommendations to the general assembly on privileges and immunities of the judges and officials of the registry, prepared a budget, established a chamber for summary procedure (five judges and two substitute judges), as provided in article 29 of the statute.

The formal opening of the court, attended by the diplomatic corps and other high dignitaries, took place on April 18, 1946. It was at this opening that each judge made the solemn declaration required by article 20 of the statute, to exercise his powers "impartially and conscientiously." (See also UNITED NATIONS.) (G. H. H.)

International Emergency Food Council: see FOOD SUPPLY OF THE WORLD.

International Information and Cultural Affairs, Office of.

On Jan. 1, 1946, the Office of International Information and Cultural Affairs was created in the department of state. This new office, often referred to as the OIC, inherited some of the overseas functions and personnel of the two wartime information agencies, the Office of War Information and the Office of the Coordinator of Inter-American Affairs, together with the state department's small cultural relations division created in 1937.

The establishment of the OIC represented the acceptance of

a new instrument of foreign policy. The first year's pattern of organization included five operating divisions and five area divisions.

The so-called "mass media" divisions: motion pictures, press, radio.

The "cultural relations" divisions: exchange of persons, libraries and institutes.

The area advisory divisions: Latin America, Europe, far east, near and middle east and occupied areas.

The Interdepartmental Committee on Scientific and Cultural Co-operation, a co-ordinating body for the international activities of 42 government bureaus, was closely related to the OIC program. Another unit maintained liaison with U.N.E.S.C.O., the United Nations Educational, Scientific and Cultural organization.

Through OIC activities in 1946, millions of the world's inhabitants came to know more about the United States—about U.S. views and trends of thought, the significance of current events and developments in the U.S., the national character of the American people, their faith in a free society and their desire to promote world collaboration and world peace.

Radio.—During the year 1946, 36 short-wave transmitters sent out international radio broadcasts from the United States in 24 languages. Daily programs included news bulletins and commentaries on the news taken from representative editorials carried in papers from Maine to California; round table discussions on topics of current interest; question and answer quizzes; interviews with prominent Americans; dramatic presentations taken from the best in American literature and similar programs combining information with listener interest. Most of the programs originated in OIC studios in New York, although some were prepared by CBS and NBC under contract with the state department. A number of programs well known to U.S. radio audiences were given to the government for use in foreign broadcasts, with the commercials eliminated. There were 50,000 letters received from overseas listeners during the year.

Press.—A daily news bulletin, sent by wireless to U.S. missions abroad, gave about 7,000 words on texts of official documents and speeches relating to foreign affairs. These bulletins were translated by OIC officers abroad and distributed to editors, writers, civic and government leaders at their request. Background stories on U.S. life, with pictures, were mailed weekly. Another service rendered to the foreign press was assistance to foreign correspondents stationed in the U.S. Aid was also given in securing reprint rights for foreign publications.

The only magazine published by the OIC for foreign readers was the Russian-language, illustrated *Amerika*. Circulation in the U.S.S.R. was increased from 10,000 to 50,000 copies during the year by permission of the soviet government. The magazine sold for 10 rubles, or approximately 83 cents a copy.

Motion Pictures.—Documentary and information motion pictures were made available to foreign audiences in 24 languages. It was estimated that OIC films reached approximately 10,000,000 people each month. These documentaries were shown at the request of schools, youth clubs, women's groups, trade union, farm, professional and civic groups and similar non-theatrical audiences. Films available for use abroad included some former OWI documentaries, a newsreel produced privately without cost to the government, selected productions of the U.S. army, public health service and other government agencies and a few documentaries from private industry. Among the most popular films were: *Cowboy, Electricity and the Land, Freedom to Learn, Library of Congress, Northwest U.S.A., TVA and Tuesday in November*. Twenty new films, acquired and translated during the year, were ready for release at the year's end; 21 additional films were in production.

Exchange of People.—In the "exchange of persons" program, the state department acted chiefly as a catalytic agent, stimulating and assisting private agencies in renewing their own international interchanges. A limited number of official exchanges was arranged with the western hemisphere countries.

Although basic legislation limited the official exchange of students, teachers, technicians and specialists to the countries of the western hemisphere, wartime emergency funds available to the OWI enabled the OIC during the first half of the year to bring a limited number of people from other parts of the world to the United States. Prominent among these were groups of foreign correspondents from the liberated countries.

Libraries and Institutes.—U.S. libraries in operation at the year's end totalled 67 in 41 countries. In addition, 27 cultural centres with 45 branches were in operation in the 20 other American republics. Cultural centres differ from libraries in that they have, in addition to books, classes in English and a wide variety of group activities. An estimated 3,500,000 readers came to the libraries for information during the year. In September the library in Yugoslavia was closed, but arrangements for its reopening were worked out in consultation with the Yugoslav government.

In connection with the libraries, photographic exhibits on such subjects as U.S. electoral procedures, prefabricated housing and soil conservation were arranged. Two special exhibits of American paintings were assembled, one showing new trends in American art, another a historical collection.

Personnel.—During the year U.S. information offices overseas were made part of U.S. diplomatic missions, and all U.S. citizens in the OIC overseas became part of the foreign service, serving either in the foreign service reserve or in the foreign service staff corps. Of the 1,800 in the OIC abroad, 370 were U.S. citizens; the others were aliens serving as translators and in other technical and office positions.

Legislation.—Legislation passed by the 79th congress in-

cluded an appropriation of \$19,284,775 for the OIC and \$5,375,000 for the Interdepartmental Committee on Scientific and Cultural Co-operation.

Authorization for a permanent peacetime cultural exchange program in the eastern as well as the western hemisphere was contained in a bill, H.R. 4982 introduced by Rep. Sol Bloom. This bill passed the house and received the approval of the senate foreign relations committee but failed to come up for a final vote in the senate in the closing days of the session. A greatly expanded program for the exchange of students, however, was approved by the passage of a resolution sponsored by Sen. James W. Fulbright. This would make available for scholarships and other cultural purposes a portion of the funds resulting from the sale of surplus war matériel abroad.

The 79th congress also authorized U.S. participation in U.N.E.S.C.O., often thought of as the international counterpart to national programs of information and cultural exchanges. (C. M. H.)

International Labour Conference: see INTERNATIONAL LABOUR ORGANIZATION.

International Labour Organization. The most noteworthy event of 1946 was the affiliation of the I.L.O. with the United Nations organization, effective Dec. 14 when finally approved by the general assembly of the United Nations. The agreement defining methods of co-operation, and making the I.L.O. a specialized agency under the charter of the U.N., "responsible for taking such action as may be appropriate under its basic instrument for the accomplishment of the purposes set forth therein," was negotiated in May 1946 by delegations of the governing body of the I.L.O., and of the Economic and Social Council of the U.N., approved by the latter in June, and by the International Labour conference in September. Thus was established a partnership of autonomous equals in the interests of world peace and world tasks of major import. The continuity of the I.L.O., its tripartite basis and its quarter-century of pioneering experience were preserved. In September Acting-Director E. J. Phelan was elected director, later confirmed as director-general of the I.L.O., effective retroactively from Feb. 1941.

Constitutional changes in the I.L.O., required to meet the new situation and the years ahead, were promptly and democratically made, not by any one man or group but only after full debate in open session at four general conferences (New York-Washington 1941, Philadelphia 1944, Paris 1945, Montreal 1946) and discussion at many meetings of the governing body and special committees. The proposed amendments severed I.L.O. ties with the League of Nations, provided that it perform its own chancery functions in the registration of its treaties, and manage its own finances and budget. They put into the constitution the enlarged economic and financial functions set forth in the Declaration of Philadelphia, and provided for the amendment of the constitution by the general conference and the constituent member states. The instrument of amendment, 1945, came into force Sept. 26, 1946, on receipt of the 39th ratification, being three-quarters of the 52 members of the I.L.O. at that time. The Montreal conference adopted a resolution in September making immediately applicable certain provisions of the instrument of amendment, 1946, still in process of ratification.

The 28th (Maritime) session of the International Labour conference met in Seattle, Wash., June 6-29, and the 29th session in Montreal, Sept. 19-Oct. 9. Some member states have no maritime interests but the Seattle conference was attended by delegations from 32 (23 delegations were complete—2 government representatives and 1 each of shipowners and seamen), and

a total of 295 delegates, advisers and official participants. Nine conventions,¹ four recommendations and nine resolutions were adopted. With 15 previously adopted conventions (12 still in force), the International Maritime code was about completed. The 29th session at Montreal was attended by delegations from 46 member states (35 complete—2 government, 1 employer and 1 worker representative), and a total of 429 delegates, advisers, official observers and other participants. Four conventions,² 2 recommendations and 14 resolutions, and an instrument of amendment (constitution) were adopted. This made 80 conventions and 80 recommendations adopted after 1919, and the ratifications numbered 922 with that of Ireland on Oct. 9 ratifying convention No. 63 (statistics of wages and hours of work, etc.). The conference adopted an operating budget of 16,000,000 Swiss francs (\$3,733,000) for 1947, to be allocated among 51 states.

The governing body held three sessions in Montreal in 1946, its 98th in May and the 99th and 100th in September, and adjourned to meet in Geneva for the 101st in March 1947. Numerous subcommittees—employment, standing orders, finance and others, and committees set up pursuant to conference resolution—women's work, permanent migration, accident prevention and the newer industrial committees, held many meetings and made valuable reports and suggestions summarized in issues of the *International Labour Review*.

The Third Conference of American States Members of the I.L.O. met in Mexico City, April 1–16, for the discussion of hemisphere policy. The 16th session of the Committee of Experts on the Application of Conventions met in Montreal, July 8–12. Many missions, the most important being that to China for technical assistance with labour problems and social insurance, and representation at numerous international gatherings (U.N.R.R.A., United Nations Food and Agriculture organization, Economic and Social Council, general assembly, etc.) taxed the resources of the I.L.O. to the utmost, but yielded worthwhile results.

More than 25 conference documents were issued, several large volumes, replete in encyclopaedic information. The three director's reports to the Mexico City, Seattle and Montreal conferences are of real historic importance. *Studies & Reports* (7 vols.) included *inter alia*: "The War and Women's Employment" and "Labour Conditions and Reconstruction Planning in India." The Serials—*International Labour Review*, *Legislative Series*, *Industrial Safety Survey* and *Official Bulletin*—were maintained at the same high level of usefulness as heretofore. (See also CHILD WELFARE; LEAGUE OF NATIONS.)

(S. McC. L.)

International Law.

There were many events in 1946 which had some relation to international law. How much that law was promoted was debatable. Although the United Nations paid lip service to the system, it was disregarded by most of the agreements made during the year.

Enemy Merchant Ships.—The navy department announced on Feb. 2 that the U.S. navy had sunk 1,944 Japanese vessels, taking 276,000 lives, during the war with Japan. It was admitted that this was in violation of the treaty of 1930 on submarine warfare. (*New York Times*, Feb. 3, p. 20.) The sinkings were not even qualified by war zones. They give ground for

thought as to the justification for the entry of the United States into World War I, April 6, 1917.

Civil Aviation.—Of the one treaty and four executive agreements concluded at Chicago, Ill., Dec. 7, 1944, the treaty was ratified on Aug. 6, 1946, pursuant to advice and consent of the senate July 25. (Dept. of State *Bulletin*, Aug. 18, 1946, p. 337.) A bilateral conference of the United States and the United Kingdom alone, because of Britain's failure to sign the Fifth Freedom at Chicago, was held at Bermuda, Jan. 15–Feb. 11. The text of the final act is printed in the *Bulletin*, April 7, pp. 594–596. There was much dispute concerning the power of the state department to enter into executive agreements concerning commercial aviation. The department insisted on the right pursuant to the Civil Aeronautics act and several statutes; the Commerce committee, 17 to 1, denied the right. The department regarded the executive agreements in force. Others did not. The ratification of the treaty might indicate that the senate had yielded. The American Federation of Labor and others protested against incorporating the aviation agreements as executive agreements, whereupon the attorney general was asked for an opinion. He wrote a somewhat equivocal opinion June 18, 1946, printed in the *Bulletin*, Dec. 8, pp. 1070–71. Another opinion of the attorney general, holding that a joint resolution of congress approved by the president was a law and had the same binding effect as a treaty in superseding inconsistent state laws, will be found in the *Bulletin*, Dec. 8, p. 1068.

The question of granting diplomatic immunity to U.N. delegates was discussed in the *New York Times*, Nov. 30, p. 1.

Yugoslavia.—For the protests against Yugoslavian obstruction to the Allied military government in Venezia Giulia, see the U.S. note May 20, 1946, published in the *Bulletin* Sept. 1, p. 409. Other protests are to be found in the same issue, p. 414 *et seq.* See also *Bulletin*, Sept. 29, p. 579; Oct. 13, p. 676.

U.S. aeroplanes flew over Yugoslav territory and were shot down by Yugoslav officials. This caused violent protest and the payment of an indemnity by Yugoslavia for five lives lost. See the *Bulletin*, Sept. 15, p. 501; Oct. 20, p. 725. Up to the end of 1946 no indemnity had been paid for the planes shot down.

The Potsdam Agreement—Reparations.—The Potsdam agreement provided a system by which the U.S.S.R. was to obtain industrial supplies from the U.S. and British zones in return for some food. This was so greatly in violation of international law that it was not surprising that the scheme had not worked. The Allied governments went so far even as to lay claim to German property in neutral countries, like Switzerland and Sweden, and agreements with these countries were worked out. Whether the threat of keeping their national property "frozen" was a factor was not known. The U.S.S.R. took the view that all property which came into possession of the German government was soviet property, particularly in the soviet zone, and thus Austria was stripped of much of its industry. This conflicted with the Austrian proposals to nationalize those industries, and the conflict was still under debate between the two governments in Jan. 1947.

On April 25 the United States received a soviet note rejecting the U.S. proposal that Manchurian industries and other Japanese external assets be used for inter-Allied reparations, contrary to the soviet view that these movable assets were considered as legitimate war booty. (*New York Times*, April 26, p. 5.) As to what was war booty, see an article by Alwyn B. Freeman in the *American Journal of International Law*, vol. 40, p. 795 (Oct. 1946). As to the earmarking by the U.S.S.R. of certain property in Vienna, see the *New York Times*, March 30, p. 6. For the withdrawal of the soviet demand to land in Austria, see the *New York Times*, April 6, p. 4. For a summary, June 17, of the soviet note of May 10 concerning German assets in

¹ Conventions: No. 68 Food and Catering for Crews on Board Ship; 69, Certification of Ships' Cooks; 70, Med. Exam. of Seafarers; 71, Vacation Holidays with Pay; 72, Crew Accommodation on Board Ship; 73, Social Security; 74, Certif. of Able Seamen; 75, Seafarers' Pensions; 76, Wages, Hours of Work, and Manning.

² Convention No. 77, Medical Examination Young Persons (Industry); 78, Med. Exam. Young Persons (non-ind. occ.); 79, Night Work Young Persons (non-ind. occ.); 80, Final Articles Revision.

Austria, see the Royal Institute of International Affairs *Chronology of International Events and Documents*, June 10–23, p. 342. Gen. Mark Clark's protest against soviet procedure is to be found *ibid.*, June 24, p. 574. As to Reparation Commissioner Edwin Pauley's definition of "German assets" at the Potsdam conference where the term was discussed, see the *New York Times*, July 18, p. 6. As to the soviet position, see the *New York Times*, Aug. 11, p. 37. As to soviet demands on Hungary and their relaxation in view of Hungary's disability, see the *New York Times*, Aug. 5, p. 6. The plan of the Allied Control council on German economy is to be found in the *Bulletin*, April 21, p. 636. As to plants which were available for reparations, see the *Bulletin*, Jan. 20, p. 69.

An agreement pertaining to reparation funds for non-repatriable victims of German action is to be found in the *Bulletin*, July 14, p. 71. The United States was prepared to renounce its share of reparations in Austria, Italy and in some other countries. For an executive order relating to the control of German and Japanese diplomatic property in the United States, see the *Bulletin* Aug. 4, p. 237. Ambassador Pauley's recommendations on Japanese reparations, which reduce that country to innocuousness if not starvation, are published in the *Bulletin*, Nov. 24, p. 957.

An agreement with Switzerland was concluded May 25 as to the division of German holdings between the Allied Reparation pool and Switzerland. See the *Bulletin* June 2, p. 955 and June 30, p. 1101, 1121. The agreement with Sweden had not been published at the end of 1946. That an agreement had been reached was announced in the *Bulletin*, July 28, p. 174.

Spain recognized the Allied Control council as the government of Germany, and on that theory concluded with it an agreement for the searching out of German hidden assets. (*New York Times*, Feb. 14, p. 15.)

In Jan. 1946 an agreement was worked out in Paris for the division of German reparations among the Allied countries. The agreement is printed in the *Bulletin*, Jan. 27, p. 114. A conference among certain Allied states as to how to divide the German-owned patents, convened in London, July 15–27. The agreement reached was in violation of the patent agreement of 1886. An article on the subject is to be found in the *Bulletin*, Aug. 18, p. 297.

Italy desequestered all Allied property in Italy April 9. See *Bulletin*, May 12, p. 817. Denmark released all controls of Allied property decreed by the German occupation according to an announcement in the *Bulletin* June 23, p. 1083. A law on vesting and marshalling German external assets is printed in the *Bulletin*, Feb. 24, p. 283. An executive order allowing the custodian to release certain property is to be found in the *New York Times*, May 17, p. 13. The Argentine government announced its intention to liquidate by auction German and Japanese assets according to an item in the *New York Times*, May 2, p. 11.

Nationalization.—Numerous governments of Europe undertook nationalization on a somewhat wide scale. The United States protested against the inclusion of American property in this expropriation. A newspaper report stated that Albania expropriated all foreign-owned companies (*New York Times*, Feb. 15, p. 8). The reply of the Polish government to the U.S. protest is found in the *Bulletin*, April 21, p. 670. The Polish Nationalization law is discussed in an article in the *Bulletin*, Oct. 13, p. 651, and the U.S. position is outlined in the *Bulletin*, Nov. 17, p. 912. A volume on the Polish nationalization and others in eastern Europe was published by Samuel Sharp, Foundation for Foreign Affairs, 1136 Eighteenth street, Washington 6, D.C.

At a meeting of the Economic Commission for Finland and the Balkans held in Paris, Sept. 23, Willard Thorp, representing the United States, protested against the soviet union's taking of United Nations property (*Bulletin*, Oct. 6, p. 620).

Czechoslovakia's provision for compensating foreign nationals victims of expropriation is to be found in the *Bulletin*, Dec. 1, p. 1003. See also the *Bulletin*, Dec. 8, p. 1027. A report of a decision declining to recognize in New York a soviet nationalization decree for Estonia is reported in the *New York Times*, Dec. 7, p. 12. The Yugoslav nationalization decree extending to all private economic enterprises is found in the *New*

York Times, Dec. 7, p. 6. An article on the British progress in nationalization is printed in the *Bulletin*, Oct. 6, p. 615.

War Criminals.—Justice Robert H. Jackson, prosecutor of the war criminals at Nuernberg, naturally defended the validity of the proceedings. His address of May 31 in Belgium is printed in the *Bulletin*, Aug. 25, p. 377, and his address July 26 at Nuernberg is printed in the *Bulletin*, Aug. 25, p. 364. His final report to the president is printed in the *Bulletin*, Oct. 27, p. 771, and Judge Francis Biddle's report with recommendations is printed in the *Bulletin*, Nov. 24, p. 954. As to the trial of far eastern war criminals, see the *Bulletin*, May 19, p. 846.

Miscellaneous.—The Allied occupation policy in Germany was subjected to grave criticism throughout the world. The restatement of U.S. policy on Germany, found in the address of the secretary of state in Stuttgart, Germany, Sept. 6, is set out in the *Bulletin*, Sept. 15, p. 496. Another address on U.S. policies in Europe, made by the secretary of state in Paris, Oct. 3, is printed in the *Bulletin*, Oct. 13, p. 665.

The participation of U.S. observers in the Greek elections, pursuant to an agreement reached at the Crimean conference of 1945, is printed in the *Bulletin*, Jan. 20, p. 56. The report of the mission is found in the *Bulletin*, Sept. 1, p. 424. A protest to the elections in Rumania is to be found in the *Bulletin*, June 9, p. 1007. See also the *Bulletin*, June 30, p. 1125.

A letter on U.S. policy in maintaining and developing international law, hardly supported by the facts, was addressed by the secretary of state to Frederic R. Coudert, president of the American Society of International Law (*Bulletin*, May 5, p. 758). A report by the secretary of state on the Paris conference of foreign ministers, June 15–July 12, is printed in the *Bulletin*, July 28, p. 167. See also the *Bulletin*, Aug. 25, p. 352.

As to U.S. policy in occupied areas, see articles published in the *Bulletin*, Aug. 18, p. 291.

The status of Turkey in the straits of the Dardanelles established by the Montreux convention, 1936, about to be revised, is discussed in various issues of the *Bulletin* after Sept. 1.

The agreement among the council of foreign ministers to discuss the German and Austrian peace treaties and on the limitation of occupying forces in Europe is published in the *Bulletin*, Dec. 15, p. 1082. (See also PRISONERS OF WAR; UNITED NATIONS.) (E. Bd.)

International Monetary Fund. During the year 1946 the final necessary steps were taken to bring the International Monetary fund into actual existence and operation. By the end of 1945, 35 of the original 44 signatories of the fund agreement had joined the fund, with quotas aggregating \$7,324,500,000, and the establishment of the fund was assured.

Under the fund agreement the government of the United States was responsible for calling the first meeting of the board of governors of the fund. Accordingly an invitation was sent by the United States in Jan. 1946 to member countries to participate in such a meeting at Savannah, Ga., beginning March 8, 1946. The following countries which had not taken the steps necessary for adherence to the fund were invited to send observers: Australia, Denmark, New Zealand, Venezuela, the U.S.S.R., El Salvador, Liberia, Panama, Nicaragua.

At this meeting of the board of governors the period in which original signatories of the fund agreement could join as original members was extended from Dec. 31, 1945 to Dec. 31, 1946. Under this resolution, Cuba, El Salvador, Nicaragua and Panama signed the Articles of Agreement in the course of the meeting. On March 30, 1946, Denmark, with a quota fixed at \$68,000,000 by the board of governors, likewise acquired membership under the authority of this resolution. The board of governors also received applications for membership from the governments of Lebanon, Italy, Syria and Turkey which were referred to the executive directors of the fund for consideration and recommendations.

At this inaugural meeting the governor of Paraguay requested that the quota of Paraguay in the fund should be increased. This request was also referred to the executive directors for consideration and recommendations.

At their first meeting on May 6, 1946, the executive directors selected as managing director Camille Gutt of Belgium who, upon accepting, resigned as executive director. The managing director was given the responsibility of organizing and directing the staff. In subsequent months much time was devoted by the fund to establishing the rules and regulations under which the fund would operate and in organizing the staff.

The first major task of the International Monetary fund was the determination of the initial par values of member countries,

since this determination was prerequisite to beginning of actual exchange transactions. By Sept. 1946 sufficient progress had been made in the organization of the fund to warrant undertaking this task. In undertaking to establish the initial par values at this time the executive directors of the fund were mindful of the many difficulties and risks involved in beginning exchange transactions before world reconstruction had taken place. It had long been foreseen, however, that the fund would begin its work in a period of disorder and disruption. Not only had sufficient flexibility been introduced into the fund agreement to allow for these conditions, but it had been thought that the fund could make a substantial contribution toward achieving world reconstruction and stability by coming into operation as soon as feasible.

The board of governors began its first annual meeting in Washington on Sept. 27, 1946. It met for six days and made a number of important decisions necessary to forward the work of the fund. The rules and regulations drafted by the executive directors were accepted without change. The recommendations made by the executive directors on the applications received from Lebanon, Turkey, Syria and Italy were acted on and it was agreed that these countries might accept membership in the fund until April 15, 1947. The quota of Lebanon was fixed at \$4,500,000; of Italy, \$180,000,000; of Syria \$6,500,000; and of Turkey, \$43,000,000.

At the request of Mexico, it was also agreed that the fund would gather material wherever available and obtainable on the monetary uses of silver. Such material would be gathered as could be useful in facilitating discussions on the subject in an international conference among interested member countries.

The question of quotas in the fund of various countries was also considered. The quota of Paraguay was adjusted to a figure of \$3,500,000 from its previous figure of \$2,000,000; and the quota for France was adjusted to a figure of \$525,000,000 from its previous figure of \$450,000,000. A request from Iran for an increase in its quota was referred to the executive directors for their recommendation to the board of governors.

After the meeting of the board of governors in the subsequent months of 1946, the executive directors devoted most of their time to the consideration of the initial par values. By Dec. 18, 1946, the International Monetary fund was able to announce that it was now prepared to begin exchange transactions on March 1, 1947, and that the transactions of the fund were to be at the initial par values which had been determined in the manner laid down in the fund agreement. (For a table of these initial par values, *see* the article EXCHANGE CONTROL AND EXCHANGE RATES.)

Certain countries, namely, Brazil, China, the Dominican Republic, Greece, Yugoslavia, France, in respect of French Indo-China, and the Netherlands, in respect of the Netherlands Indies, requested more time for the determination of their initial par values and the fund so agreed. Pending the completion of certain legislative proceedings in Uruguay, the initial par value of its currency was not definitely established.

The major significance of this action was not in the particular rates of exchange which were announced, but that now, in practice, countries were acting together in the international monetary field. The initial par values in all cases were those which were proposed by members and were based on existing rates of exchange. However, it was clearly stated in the fund announcement that the acceptance of these rates was not to be interpreted as a guarantee by the fund that all rates would remain unchanged; rather the acceptance of these rates was largely in recognition of the fact that the existing substantial disparities in price and wage levels among a number of countries did not have the same significance as in normal times, *e.g.*, in practi-

cally all countries exports were being limited mainly by difficulties of production or transport rather than exchange and price considerations.

As the year 1946 ended, work was being pursued in the fund to complete the specific steps necessary to begin the actual exchange transactions of the fund. It was hoped, and expected, that by the end of 1947 the fund would have made a substantial contribution toward the achievement of world reconstruction and stability. (*See also* BANKING; TARIFFS.) (H. D. W.)

International Stabilization Fund: *see* BANKING.

International Trade. During 1946 international trade was somewhat dislocated as a result of World War II. Heavy wartime shipments of munitions were supplanted by materials for relief and reconstruction. Exports from the western hemisphere to the devastated areas of Europe and Asia continued very large whereas European and Asiatic exports were necessarily small, but they increased as the year advanced and as transportation facilities were restored and industries were reconstructed or revitalized. There were also changes in the direction and volume of trade, compared with prewar years, as a result of the controlled economies and reduced trade levels of Germany and Japan in keeping with the Potsdam declaration. Before World War II Germany and Japan ranked third and fifth, respectively, in world trade.

The distribution of essential commodities in world short supply continued under international allocation, but the supply of a number of these products continued to ease, so that by the end of 1946 only coal, tin and some agricultural commodities remained on the international allocation lists.

Relief shipments figured large in the international movement of goods to liberated areas. United Nations Relief and Rehabilitation administration supplies shipped to Europe were heaviest to Czechoslovakia, Greece, Italy, Poland, Yugoslavia, Byelorussia and the Ukraine. In Asia the U.N.R.R.A. program was concentrated in China.

The speed of recovery of international trade in the postwar period was retarded in many areas by such problems as internal political disturbances, work stoppages, shortages of labour, food and basic raw materials, exchange difficulties, bilateral trade arrangements and the almost universal exercise of trade controls.

Because some countries did not resume the reporting of their imports and exports, a complete picture of world trade was not possible. Statistics which were available, being mostly based on values of goods imported and exported, were influenced by the sharp price rises and exchange fluctuations which had occurred.

Trade of War-torn Areas.—The pressing postwar need for food, raw materials and equipment in European countries resulted in heavy imports while at the same time exports were necessarily small, thus swelling European import balances to large proportions. This fact is reflected in the statistics of trade of Canada, the United States and the United Kingdom with the continent.

Table I.—Canadian, United States and United Kingdom Trade Balances with Continental Europe,* Prewar and 1946
(Monthly averages in millions of U.S. dollars)

United Kingdom	69.0	108.4	-39.4	98.1	48.7	+49.4

*Excluding the U.S.S.R.

Receipts from shipping services and tourists, which before World War II were significant offsetting items for adverse trade balances in many European countries, had not yet returned to prewar magnitude. The increased postwar excesses of imports, therefore, were more difficult to finance. Trade figures

of those European countries for which statistics were available reflected efforts to narrow the gap by stepping up exports as fast as transportation and production facilities permitted.

†The official exchange rate of the franc was changed on Dec. 26, 1945, from 49.625 to the dollar to 119.10669 to the dollar.

‡Not available.

§The official exchange rate of the Swedish crown was changed, effective July 13, 1946, from 4.20 to the dollar to 3.60 to the dollar.

The widespread use of bilateral trade and clearing arrangements by European countries as temporary expedients to restore some measure of trade in the face of exchange difficulties and the exercise of export and import controls to carry out the agreements tended to direct their trade into somewhat fixed channels.

In Asia, continuing local political disturbances and shortages of labour and food in many countries, in addition to war damages and transportation difficulties, resulted in a rather slow revival of exports. The recovery in rubber shipments from British Malaya was an exception.

Chinese imports during the first nine months of 1946 exceeded exports 6 to 1 in value. More than 60% of the imports came from the United States and included such items as rice, wheat, raw cotton, trucks, busses and all kinds of machinery.

Japanese foreign trade continued under the strict supervision of the supreme commander for the Allied powers. Most of the limited Japanese trade was with the United States. Exports consisted mainly of raw silk.

United Kingdom.—Progress made by the United Kingdom during 1946 in its export drive to 175% of the prewar volume was indicated in the export volume index (1938=100) which rose from 84 in the first quarter to 117 in October. The necessity for the export expansion program was brought about by Great Britain's reversed balance of payments position on current account as a result of the conduct of the war. Lines of credit amounting to \$1,250,000,000 from Canada and \$3,750,000,000 from the United States were made available to the United Kingdom to assist it in weathering the difficult transition period. The clauses in the Anglo-U.S. financial agreement relating to the freeing of receipts from current transactions of all sterling countries for current transactions in any currency area without discrimination and those relating to the future settlement of accumulated sterling balances had an important bearing on the multilateral trade objective advocated by the United States and supported by the United Kingdom.

Canada.—The end of World War II and the consequent decrease in shipments of military supplies and equipment brought about a decline in Canadian exports; however, the average monthly value of exports during the first nine months of 1946 was almost two and one-half times the 1936-38 average. For imports, also, the 1946 average (excluding Canadian military goods returned from abroad) was almost two and one-half times the prewar average value. Obviously price increases had a considerable effect on the figures and the 1946 volume of imports and

||Excluding U.S.S.R.

¶Imports for consumption. Figures include "Canadian goods returned," which apart from the returns from the United States, in 1945 and 1946 consisted mainly of Canadian military equipment returned from abroad. In the case of imports from the United Kingdom and Newfoundland, the value of returned equipment is large enough to introduce distortion, and no use should be made of aggregate figures of imports from these two countries without taking this item into account. The amounts involved are as follows:

(millions of Canadian dollars)

	Nine months ended September	
	1945	1946
United Kingdom	4	60
Newfoundland	8	2

exports was considerably lower than the value figures indicated. Value and volume indexes for 1946 not being available, those for 1945 are given.

The Canadian statistics showed continued heavy concentration of export and import trade during 1946 with the United States. Before the war the United States was Canada's chief supplier and the United Kingdom the chief purchaser of Canadian goods. Some signs of expansion were observed in Canadian trade with the Latin American republics and with India.

The Canadian dollar was revalued upward in July from \$0.90909 in United States currency to a par with the United States dollar.

United States.—During 1946 exports from the United States ran at about the same dollar rate as that during 1945 in spite of the great decrease in lend-lease exports as a result of the end of the war. Also, in

*Does not include trade in gold and silver.

†Including re-exports but excluding overseas sales of surplus military equipment.

terms of value, 1946 exports were about three times the 1936–38 average, but were about twice the prewar volume. Imports averaged almost twice the prewar value but were actually only a little above the 1936–38 volume. Compared with 1945, goods were imported during 1946 at a slightly higher rate, in terms of volume as well as value, reflecting an increase in imports from formerly occupied areas of Europe and Asia.

Lend-lease exports in 1946 consisted principally of foodstuffs and reconstruction equipment and machinery the procurement of which had been arranged prior to V-J day. Although the lend-lease program came to an end with the end of World War II, these supplies, which were badly needed abroad, were exported under a special cash-reimbursable arrangement.

A marked increase occurred during 1946 in U.S. shipments for U.N.R.R.A.'s account. The close of the year brought to an end U.N.R.R.A.'s procurement program for Europe, but some items remained to be shipped to the continent during 1947. U.N.R.R.A. procurement for China was scheduled to continue until March 31, 1947.

The commodity composition of exports indicated the role of the United States in providing food and equipment for relief and reconstruction of a war-torn world. One-fourth of total United States exports during the year consisted of foods, crude and manufactured. In the immediate prewar years, foods accounted for slightly more than 10% of the total.

‡Excluding U.S.S.R.

§General imports.

Increased United States exports to the Latin American republics reflected increasing availability of consumer goods and capital equipment to those countries in response to a demand unsatisfied during the war. The importance of the United States as a source of supply of essential equipment and relief supplies during the year was shown in the heavy exports to Europe and Asia. Exports to the United Kingdom and the U.S.S.R. continued the sharp decline from high wartime levels.

Although some increase was indicated in United States imports, the export balance remained substantial, but implications of the United States' creditor position were generally recognized as pointing up the necessity for a higher level of imports.

Latin American Republics.—The foreign trade of the Latin American republics continued to be concentrated among themselves and with the United States; however, there were signs of revival of trade with continental Europe.

Toward Freer Multilateral Trade.—Although the foreign trade of most countries continued during 1946 under controls almost as strict as those during the war, and although the direction of trade was thus fixed to a large degree in accordance with bilateral arrangements, the situation was regarded as a transitional phase and as the year closed the stage was set for relaxation of restrictions and lowering of barriers, looking toward a freer multilateral trade. The International Monetary fund and the International Bank for Reconstruction and Development had been established; the charter proposed by the United States for an International Trade organization had been considered by a preliminary commission in preparation for a full conference in 1947; the United States and the United Kingdom had agreed to move forward together and with other countries toward the common objective of expanded multilateral trade; and the United States had announced its intention to seek tariff-reducing

agreements with 18 other nations in concert. (See also BUSINESS REVIEW; EXCHANGE CONTROL AND EXCHANGE RATES; INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; INTERNATIONAL MONETARY FUND; LEND-LEASE; UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION.) (S. L. D.)

U.S. Trade Agreements.—The most important event in 1946 relating to United States reciprocal trade agreements was announcement by the United States on Nov. 9 of intention to conduct simultaneous trade agreement negotiations with the following 18 countries: Australia, Belgium, Brazil, Canada, Chile, China, Cuba, Czechoslovakia, France, India, Lebanon, Luxembourg, Netherlands, New Zealand, Norway, South Africa, Union of Soviet Socialist Republics and the United Kingdom. Negotiations were to be conducted at Geneva, Switzerland, beginning April 8, 1947. This was the most extensive reciprocal trade agreement negotiation yet undertaken.

Under authority of the Trade Agreements act 33 reciprocal trade agreements were concluded with 29 countries. The latest trade agreement concluded was that with Paraguay on Sept. 12, 1946. Authority to negotiate reciprocal trade agreements was first granted by congress on June 12, 1934, for a three-year period and was continued in effect by four subsequent renewals: in 1937 and 1940 for three-year terms, in 1943 for a two-year term and in 1945 for three years. In accordance with provisions of the act as extended and amended in 1945 rates of duties may be modified by 50% of rates in effect Jan. 1, 1945. Previously, the authority to modify rates of duty was in general limited to 50% of the rates in effect at the time the act was first enacted.

As a co-ordinate step in the program to expand foreign trade and create a higher level of employment and prosperity in all countries the United States published in Sept. 1946 a *Suggested Charter for an International Trade Organization of the United Nations*. This represented an elaboration of the *Proposals for Expansion of World Trade and Employment*, published the previous year. The *Suggested Charter* served as the main basis for discussion when the Preparatory committee of the International Conference on Trade and Employment (created by the Economic and Social Council of the United Nations) met in London between Oct. 15 and Nov. 26, 1946. At the committee meeting a preliminary redraft charter was drawn up to be discussed further at a second meeting of the committee which was to be held at Geneva, Switzerland, concurrently with the negotiations for reduction of trade barriers. (W. L. C.)

Interstate Commerce Commission. The duties and powers of the Interstate Commerce commission are set forth in the Interstate Commerce act, originally passed in 1887 and later amended in many important particulars. The act is divided into four parts, and deals with the regulation of rail, motor and water carriers and freight forwarders. The regulatory powers of the commission extend, among other things, to the charges made by these carriers for transportation services; to questions involving the valuation and financial reorganization of railroads; to the issuance of securities; to the acquisition or control of these various carriers by other carriers or persons; to their accounting practices and the abandonment of lines of railway; and to matters involving the determination of whether public convenience and necessity require the institution of new services by motor and water carriers or by freight forwarders, or for the construction and operation of lines of railway.

The commission's statutory powers and duties did not change materially during the year 1946, but its membership was re-

duced by the death, on Aug. 17, of Commissioner Claude R. Porter, who had served as such from 1928. George M. Barnard of Indiana was selected as chairman for the year 1946, and Clyde B. Aitchison for the year 1947. The president reappointed Commissioners William E. Lee and William J. Patterson for additional terms of seven years beginning Jan. 1, 1946, and Commissioner Carroll Miller for a similar term beginning Jan. 1, 1947. Richard F. Mitchell was appointed to fill the unexpired remainder of the term of Commissioner Porter, or until Dec. 31, 1949. Commissioner J. Monroe Johnson continued to serve also as director of the Office of Defense Transportation.

The carriers subject to the jurisdiction of the commission experienced another difficult year. While passenger traffic had declined and there had been a reduction in government traffic because of a cessation of hostilities, the processes of reconversion and industrial labour shortages taxed all facilities of transport to the utmost. Transportation by railroad was conducted under most difficult circumstances, and because of increasing car shortages, and deferred replacements and maintenance work, was at the end of 1946 still short of normal. Increases in wages and other operating costs caused an emergency increase averaging 6.5% in freight rates effective July 1, 1946; and upon an exhaustive hearing of the carriers' application the commission on Dec. 5 approved a plan of increases averaging 17.6%, which became effective Jan. 1, 1947.

The commission's decision in the very important *Class Rate* case, 262 I.C.C. 447, was sustained by the district court, but its order was stayed pending determination of the supreme court, where the case was pending at the end of the year.

Intestinal Disorders: *see* ALIMENTARY SYSTEM, DISORDERS OF.

Intoxication, Alcoholic. A state-wide system of free care for alcoholic addicts was developed in Connecticut, the program being financed by a fund to which reverts 9% of all income from liquor licence permits. It established out-patient clinics in major population centres of the state and a commitment centre, to which intractable alcoholics may be sent. A similar modified program had been in existence for some time in Sweden, Norway, Denmark, Finland, the Netherlands and Switzerland.

The year witnessed a proposal that the United States government establish and operate federal clinics for the treatment of alcoholic addicts and also an increase in the organization of voluntary efforts for the dissemination of information on alcohol in relation to health and welfare.

The Rochester, N.Y., Committee for Education on Alcoholism, said to be the tenth of its kind in the United States, was organized with the object of disseminating information on the subject, and promoting more adequate hospital and out-patient accommodations for the treatment of alcoholics.

The fourth session of the Yale university (New Haven, Conn.) summer school on alcoholism was held and a similar course inaugurated at the University of California, Los Angeles, and at the University of Wisconsin, Madison.

During 1946 the value of chemical tests for the concentration of alcohol in the blood was more and more recognized as admissible evidence before courts of law in the United States with a growing trend of increased prestige for testimony of this nature.

In the case of blood alcohol concentration wherein a supplementary medical examination is necessary to determine intoxication, mention may be made of the phenomenon of positional nystagmus, observed both experimentally and clinically in acute intoxication from alcohol. The threshold of concentration of

alcohol in the blood at which positional nystagmus first appears has not been determined exactly.

Caffeine (15 gr.) with sodium benzoate was advocated for the treatment of violent or comatose alcoholic patients.

Nutritional factors play a fundamental role in the production of physical and mental disturbances seen among drunkards. The weight of evidence supports the view that cirrhosis of the liver is a multiple nutritional deficiency syndrome and that its prevention is concerned with an adequate caloric intake consisting of a high protein, low fat, diet. Hypochromic iron deficiency and other forms of anaemia associated with achlorhydria, as seen among chronic drinkers, are correlated to inadequate amounts of casein in the diet. Pancreatic disturbances are not uncommon in chronic alcoholism and the literature sounds a warning against surgical procedures for acute abdominal symptoms in chronic alcoholics with positive serum amylase findings.

Intraspinal injections of 10 to 15 mg. of Vitamin B₁ was reported as calming excited patients with delirium tremens. The use of morphine is dangerous, paraldehyde continuing to be the sedative drug of choice.

The effects of insulin and of insulin and glucose in the treatment of acute intoxication led some observers to recommend massive insulin therapy in chronic alcoholism, for it is asserted that insulin brings the patient to a "pliable" responsive mood and thus enhances the application of psychotherapy.

The successful application of contraconditioning measures used by "Alcoholics Anonymous" was considered by one author as a spiritual awakening similar to a conversion experience whereby a predominantly hostile attitude changes to a positive affirmative one.

This phenomenon of group activity in the treatment of chronic alcoholism attracted wide attention. The interaction of all members of the group had significant therapeutic values when under the direction of a group leader familiar with individual problems presented by its members.

Other psychological and psychiatric approaches embraced the application of hypnotism with or without the use of somnifacient drugs or the re-evaluation of psychogenic factors involving difficulties of the whole person. (*See also LIQUORS, ALCOHOLIC.*)

Inverchapel, Sir Archibald John Kerr Clark,

1ST BARON, OF LOCH ESK (1882—), British statesman and diplomat, was born March 17. A native of Lanarkshire, Scotland, he was educated by private tutors and entered the British foreign service in 1906. He enlisted in the Scots Guards in 1918 and returned to the foreign service after the close of World War I. In 1925, he became minister to Guatemala; he was minister to Chile (1928-31) and to Sweden (1931-35). He was appointed ambassador to Iraq in 1935 and ambassador to China in 1937. After spending five years in China, he was shifted in 1942 to the post of British ambassador at Moscow. His elevation to the peerage as Baron Inverchapel of Loch Esk was disclosed (Jan. 21, 1946) and four days later (Jan.

25) it was announced that he had been named British ambassador to the U.S. Before taking up his new duties, Lord Inverchapel was dispatched to Batavia, Java, to attempt mediation of the Dutch-Indonesian conflict. Following his return to London to report on his mission, he left for Washington, D.C., and presented his credentials to President Truman June 5, 1946.

Investment Banking: *see* BANKING.

Iodine. The only information available on the production of iodine in the United States was that during World War II the output was much higher than the 299,286 lb. reported in 1937. Large accumulated stocks led to a decrease in imports from 2,744,930 lb. in 1943 to 1,204,303 lb. in 1944 and 220,526 lb. in 1945. (G. A. Ro.)

Iowa. A north central state of the United States, popularly known as the "Hawkeye state." Area, 56,280 sq.mi., of which 294 sq.mi. are water. The population in 1940 was 2,538,268 with 1,084,231 listed as urban and 1,454,037 as rural. Only 16,694 were Negroes and 883 others were nonwhite. Of the white population 117,245 were foreign-born. In 1945 the population was estimated to be 2,259,526. The principal cities are: Des Moines, the capital (159,819); Sioux City (82,364); Davenport (66,039); Cedar Rapids (62,120); Waterloo (51,743); Dubuque (43,892) and Council Bluffs (41,439).

History.—The principal state officers elected in Nov. 1946 to take office in Jan. 1947 were: governor, Robert D. Blue; lieutenant governor, Kenneth A. Evans; secretary of state, Rollo H. Bergeson; auditor, Chet B. Akers; treasurer, J. M. Grimes; secretary of agriculture, Harry D. Linn; attorney general, John M. Rankin and superintendent of public instruction, Jessie M. Parker. All the elected state officers, the U.S. senators (George A. Wilson and Bourke B. Hickenlooper) and the eight representatives in congress were Republicans. The 52nd general assembly, consisting of 50 senators and 108 representatives, met in regular session on Jan. 13, 1947. The efficient administration of the state's penal and charitable institutions, tax revision and additional funds for education were among the problems confronting the legislators. The preceding assembly provided a retirement system for governmental employees.

Education.—During the school year 1944-45, out of the school population (ages 5-21) of 631,403, about 343,464 pupils were enrolled in the 9,499 public elementary schools; 116,277 in the 802 public high schools and 472 in the 15 junior colleges. This was about 4% less than the enrolment in 1942-43 and corresponded to the decrease in population during World War II. Teachers in the public schools numbered 22,951.

There are three state supported institutions of higher education—the State University of Iowa (1847) at Iowa City, the State College of Agriculture and Mechanic Arts (1858) at Ames and the State Teachers college (1876) at Cedar Falls. In Oct. 1946, these three institutions had a total enrolment of 21,468, of which some 12,000 were veterans attending under the G.I. Bill of Rights. There are also 22 colleges sponsored by churches and private agencies; enrolment was approximately double that in 1945 and included some 13,000 veterans.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the fiscal year ending June 29, 1946, Iowa paid out \$19,001,363.90 for old-age assistance, of which \$9,096,837.35 came from the federal government. The state appropriation for aid to the blind was \$150,000 annually, \$375,000 for aid to dependent children and \$120,000 per year for child welfare. During 1945-46 \$9,406,257.49 was collected for unemployment insurance and \$4,844,048.90 was expended, leaving a total balance, on July 1, 1946, of \$64,407,639.75.

On Dec. 1, 1946, there were 12,271 inmates in the state's charitable and correctional institutions. The principal groups were: 6,479 in the four hospitals for the insane; 1,862 in the school for the feeble-minded at Glenwood; 1,682 in the hospital for epileptics at Woodward; 1,636 in the state prisons for men at Fort Madison and Anamosa; 55 in the reformatory for women at Rockwell City; 244 in the training school for boys at Eldora and 113 in the training school for girls at Mitchellville.

Transportation and Communication.—There were in 1946 approximately 100,000 mi. of public highways in Iowa, of which more than 9,600 mi. were primary roads managed by the state and about 13,750 mi. were county trunk highways. By July 1, 1946, Iowa had 5,543 mi. of paving, 1,198 mi. of bituminous-surfaced roads and 51,228 mi. of gravelled roads. During 1945-46 the state spent \$1,777,825.78 on constructing primary roads and \$5,002,678.12 for road maintenance.

At the close of 1945 the track mileage of steam railroads in Iowa was 9,229.10 mi. During 1945 these roads carried 13,824,981 passengers and 106,667,458 tons of freight. There were at the same time 397.37 mi. of electric interurban track on which 1,189,060 passengers and 3,262,395 tons of freight were transported, while motor buses carried 21,669,303 passengers. The number of motor vehicles licensed in Iowa in 1945 was 800,430, of which 590,579 were passenger cars. There were 1,245 mi. of pipe lines for crude oil and gasoline and 2,690 mi. for natural gas. Telephones in Iowa in 1945 numbered 673,000, 80% of the farms and 94% of the urban dwellings having telephones.

Banking and Finance.—On June 29, 1946, there were 97 national banks in Iowa with deposits of \$729,261,000 and resources of \$766,949,000. The 552 state banks had deposits totalling \$1,365,802,141, an increase of \$169,459,128 over 1945 and assets of \$1,445,294,047, an increase of \$179,789,619.

In 1945 the principal sources of state revenue in Iowa were the retail sales tax \$25,140,370; gasoline tax \$19,511,368.03; motor vehicle tax \$11,807,754; income tax (one-half the levy only) \$8,291,538; cigarette tax \$2,670,868; inheritance tax \$2,034,015; insurance tax \$1,944,957 and profits from the state liquor stores, \$5,000,000. Expenditures for each year of the biennium 1945-47, as given in the state budget, totalled \$53,830,000 annually, an increase of 1.5% over 1943-45. The largest items were \$18,420,000 for schools, \$11,300,000 for highways, \$10,454,000 for hospitals and \$10,000,000 for old-age assistance. On March 31, 1946, the state treasury reported a net expendable balance of \$69,490,304.13.

Agriculture.—There were 205,399 farms in Iowa in 1946 (213,318 in 1940), with 34,671,736 ac. averaging 168.8 ac. per farm. The assessed value of farm land and buildings in 1946 was \$1,681,525,508, estimated to be about 60% of actual value. This was \$1,680,737 more than in 1945. For the first eight months of 1946 Iowa farmers received a cash income of \$1,074,087,000. Of the total cash income for 1945, \$1,246,095,000 came from livestock, \$255,604,000 from crops and \$37,915,000 from government payments. On Jan. 1, 1946, there were 11,869,000 hogs on Iowa farms, 5,086,000 cattle, 1,596,000 sheep, 512,000 horses and 24,000 mules, all less than in 1945 except in the case of hogs which numbered 879,000 more than in 1945. There were 23,748 auto trucks on farms, 177,431 tractors and 46,546 mechanical cornpickers.

Table I.—Leading Agricultural Products of Iowa, 1946 and 1945

Crop	1946 (est.)		1945	
Corn, bu.	661,620,000		508,106,000	
Oats, bu.	220,476,000		214,440,000	
Soybeans (grain), bu.	34,960,000		34,848,000	
Hay (tame), tons	4,859,000		5,644,000	
Potatoes, bu.	2,880,000		3,960,000	
Wheat, bu.	3,312,000		2,745,000	
Popcorn, lb.	81,900,000		105,000,000	
Rye, bu.	204,000		174,000	
Barley, bu.	360,000		84,000	

Manufacturing.—Iowa is not primarily a manufacturing state although the products of industrial establishments about equal the value of the agricultural products. In 1945 there were 2,670 manufacturing plants in Iowa, employing some 80,000 workers, with pay rolls aggregating \$160,000,000. These plants turned out products valued at \$1,500,000,000.

Table II.—Principal Mineral Products of Iowa, 1944 and 1943

Mineral	1944		1943	
	Production	Value	Production	Value
Bituminous coal	2,690,000 tons	\$9,496,000	2,770,610 tons	\$8,575,522
Cement	3,408,616 bbl.	5,677,787	3,912,307 bbl.	6,335,173
Stone	3,563,020 tons	4,175,005	3,544,560 tons	4,327,782
Sand and gravel	5,271,031 tons	2,084,149	5,070,927 tons	1,979,559
Gypsum	398,143 tons	655,392	418,092 tons	595,602

Mineral Production.—Iowa ranked 29th among the states in the total value of minerals produced in the U.S. from 1911 to 1944. (R. A. GA.)

Iowa, State University of. Located at Iowa City, Ia., this institution of higher education was established Feb. 25, 1847, and was the first state university to admit women on equal standing with men. Enrolment in the fall of 1946 reached 9,783 students, a record for one semester. It included more than 7,000 men, of whom about 5,500 were war veterans. Housing of students became a major problem and resulted in erection of barrack-type apartments, trailers and Quonset huts. Numerous staff members returned from war service and all colleges had record enrolments. Plans were formulated to observe the university's centennial in 1947 with a program of events beginning in Feb. and extending into June. (For statistics of endowment, enrolment, faculty, library volumes, etc., *see* also UNIVERSITIES AND COLLEGES.)

Iowa State College. This land-grant college, located at Ames, Ia., founded in 1858, had a record enrolment for the fall quarter of 1946 of 9,214 students, of whom 63% were veterans of the armed forces. To house this peak enrolment trailers, Quonset huts and prefabricated barracks were installed in a 100-ac. area adjoining the campus. A

complete schooling unit for freshman in science and engineering was set up at Camp Dodge, a state guard training camp near Des Moines.

The college had established an institute for atomic research which was to emphasize in its work the applications of atomic energy to agriculture, engineering, science and veterinary medicine. An agricultural outpost, intended as a research centre for the study of corn and other crops, had been established by the college at Antigua, Guatemala. College scientists found strains of corn which showed promise of being resistant to corn rootworm and certain types of rust and leaf spot diseases. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Iran. Known before March 1935 as Persia, an independent kingdom of western Asia bounded on the east by India and Afghanistan, on the north by the U.S.S.R., on the west by Turkey and Iraq and on the south by the Persian gulf and Arabian sea. Area: 628,000 sq.mi.; pop. (1938 est.): c. 15,000,000, (1940 census): 17,000,000. Chief towns (pop. 1940 census): Tehran (cap. 540,087); Tabriz (213,542); Isfahan (204,598); Meshed (176,471); Shiraz (129,000). Language: mainly Persian, but some Turki and Armenian in the north, Kurd in the west, Arabic in the south and Pashtu in the east. Religion: mainly Mohammedan (*Ithna-'Ashariya*), but c. 10% of the Mohammedan belong to the Sunni sect; there are also c. 50,000 Gregorian Armenians and a few thousands of Catholic Armenians, 30,000 Nestorians and 50,000 Jews. Ruler: Shah Mohammed Riza Pahlavi; prime minister: Ahmad Ghavam-es-Saltaneh (Jan. 26, 1946).

History.—Throughout 1946 internal dissensions affected Iran's relations with foreign countries, especially Britain and the U.S.S.R. In January the government considered that a situation liable to lead to international friction had developed, and Ebrahim Hakimi, the prime minister, instructed the Iranian delegation to the United Nations assembly to refer to the security council a complaint that soviet officials were interfering in Iran's internal affairs. Two days later the Hakimi government, whose policy was considered in Moscow as unfriendly to the U.S.S.R., resigned. On Jan. 26 Ahmad Ghavam-es-Saltaneh, supported by the soviet-sponsored *Tudeh* (Masses) party, was elected prime minister by 53 votes to 51 in the *Majlis*. Although M. Ghavam maintained Hakimi's complaint to the security council, he proceeded to direct negotiations with the soviet government with a view to settling the outstanding differences.

The negotiations with Moscow ended in agreement. By this, soviet troops—which, according to the decision of the Tripartite conference of Berlin (Aug. 2, 1945), should have left before March 2, 1946—were to evacuate all Iranian territory within six weeks from March 24, and a proposal to form a joint soviet-Iranian company for prospecting and working the oil deposits in northern Iran was to be submitted to the *Majlis*. Regarding the internal question of Azerbaijan the Iranian government, taking into consideration the necessity for reforms under existing laws, would make the necessary arrangements for the solution of the difficulties, which had arisen with the provincial government. A new governor general, Dr. Salamollah Javid, was appointed by the central government in agreement with the provincial government. Jaafar Pishevari, the pro-soviet premier of Azerbaijan, was asked to remain in office until the elections.

In June a mission under Prince Mozaffar Firouz, minister of labour, negotiated an agreement with the provincial government of Azerbaijan on a threefold basis: (1) Azerbaijan would abandon its autonomy and become part of Iran; (2) relinquish its ministries and premiership and (3) establish administration for the time being by provincial and city councillors. After the soviet army had been withdrawn from Azerbaijan Ghavam announced on May 24 that the complete evacuation of Iranian soil had been "certified."

In May the council of ministers approved an up-to-date labour bill which was brought into force on an experimental basis pending its approval by the *Majlis*, when elected. Wages and working conditions were regulated, the formation of trade unions was authorized, and machinery created for the settlement of industrial disputes. Two unions secured recognition, one covering the Bank Mellié and the other the Anglo-Iranian Oil co. On July 14 a general strike of all the Anglo-Iranian Oil company's employees (c. 50,000) in the Khuzistan province took place. After negotiations with Prince Firouz the workers resumed work. The strike had lasted four days. The day after the strike ended a

British cruiser and a sloop anchored at the mouth of the Shatt-al-Arab in Iraqi waters, and on Aug. 12 British troops from India disembarked at Basra. It had been announced that the troops were being sent to Basra "in order that they may be at hand for the protection, should circumstances demand it, of Indian, British and Arab lives and in order to safeguard Indian and British interests in south Iran."

On July 31 Ghavam reconstituted his cabinet, including in it three *Tudeh* members. He protested against the presence of troops at Basra and requested their immediate withdrawal. In September a revolt against the central government took place in southern Iran. Fighting in the south ceased on Oct. 6, and ten days later agreement was reached with the southern leaders providing that the constitution should be respected, provincial and city councils should be formed for the Fars province, the number of Fars deputies should be increased and government officials for Fars should be elected from local candidates.

Ghavam tendered the resignation of his cabinet on Oct. 17 and formed a new government without any of the three *Tudeh* ministers.

A decree ordered the *Majlis* elections to be held on Dec. 7 under the supervision of government forces to ensure freedom of voting and to suppress possible disturbances. In accordance with this decree government troops would be sent into Azerbaijan to supervise the elections. *Pravda* attacked the Iranian prime minister's policy, saying that he intended to frustrate a peaceful settlement of the Azerbaijan problem. The government notified the security council of the U.N. of its intention to send troops into Azerbaijan, as into other provinces, to see that the elections were carried out without disturbance, in spite of the "friendly admonition" of the soviet ambassador that the movement of troops into Azerbaijan might lead to disturbances near the soviet border.

(R. F. O. B.)

The Azerbaijan authorities refused to permit the extension to that province of the arrangements designed to secure throughout Iran a free and impartial verdict at the polls. Ghavam postponed the elections to give Pishevari and his friends time for reflection. As the dissident faction in Tabriz maintained its negative standpoint, orders were given to the Iranian army to advance into Azerbaijan. Although Pishevari tried to incite the local population to "die in defense of their liberties," the troops were welcomed everywhere, especially in Tabriz where they entered on Dec. 11. In Tehran the opinion prevailed that Dec. 11 was one of the great days in the history of Iran, now finally united under the shah, whose own part in the events had not been insignificant.

The elections began on Dec. 21. The popularity of Ghavam and his Democratic party left little doubt as to their results.

Education.—(1938) 8,381 schools; 457,236 pupils; 13,078 teachers; one university at Tehran.

Banking and Finance.—Revenue, ordinary (1944-45) \$137,900,000; expenditure, ordinary (1944-45) \$137,900,000; foreign loan (nil); public debt (1944) \$76,925,000; note, circulation (June 1946) \$206,360,000; gold reserve (June 1946) \$123,000,000; bank deposits (June 1946) \$277,446,000; exchange rate (1946) 1 rial=3.08 cents U.S.=0.0274 gr. fine gold.

Trade and Communications.—Foreign trade (merchandise) (1945): imports \$125,820,000; exports \$196,707,000; communications (1938) roads fit for wheeled traffic c. 8,770 mi.; railways open to traffic (1945) c. 1,270 mi.

Agriculture and Minerals.—Production (in short tons): petroleum, crude (1945) 18,886,000; wheat (1941) 1,870,000; barley, 210,000; rice (est. 1937-38) 420,300; cotton (1943) 22,000; wool (1943) 13,200; beet sugar (1941-42) 26,400; tobacco (1940-41) 13,970.

Iraq. An Arab state of the near east, between Iran, Syria and Saudi Arabia, watered by the Tigris and Euphrates; an independent kingdom after 1932, when the British mandate was terminated. Area: 143,250 sq.mi.; pop. (est. 1944): 3,561,000. Chief towns (pop. census 1934): Baghdad (cap., 400,000), Mosul (260,000), Basra (180,000), Language: Arabic; religion: mainly Mohammedan, but also Christian, Jewish and other communities. Ruler: King Feisal II; regent: Crown Prince Abdul-Ilah; premier (1946): Sayid Ahshad Al-Umari.

History.—In January Gen. Nuri es Said, former premier, led an official delegation to Turkey. Agreements were concluded providing for collaboration in cultural, economic and security questions. In June workers and students in Baghdad demanded the immediate withdrawal of British troops from Iraq and the submission of the Palestine question to the Security council. The Iraq government protested to Britain and the U.S.A. against the Palestine report. The soviet journal *Red Fleet*, discussing the British position in Iraq, stated that the British were backing negotiations for a middle east power bloc to act as a buffer between the U.S.S.R. and Britain and accused Britain of blocking the independence and sovereignty of any nation that fell within its sphere of strategical interest. On Aug. 2 it was announced that Britain was sending troops from India to Basra "in order that they might be at hand for the protection, should circumstances demand it, of Indian, British and Arab lives and in order to safeguard Indian and British interests in south Persia." The ban on political parties imposed before 1937 was lifted.

(R. F. O. B.)

Education.—1944-45: nursery schools 56, scholars 7,891; elementary schools 822, scholars 89,124; elementary evening schools 24, scholars 3,962; old people's elementary schools 99, scholars 3,788; secondary schools 71, scholars 11,309; teachers' training colleges, male 4 (students 899), female 2 (students 416); colleges 13, students 2,788.

Finance.—Revenue, ordinary (est. 1945-46) 22,158,540 Iraq dinars; expenditure, ordinary (est. 1945-46) 22,777,386 dinars; notes in circulation (Nov. 1945) 43,242,670 dinars; foreign assets reserves (Aug. 1946) 45,000,000 dinars; exchange rate (1946): 1 dinar = £1 sterling = 403.4 U.S. cents.

Trade and Communication.—Foreign trade, 1945 (merchandise): imports (excluding British army stores) 15,010,000 dinars; exports, domestic (excluding crude petroleum) 8,029,500; 1939 (short tons): grain, pulses and flour 314,000; dates 162,000; wood (raw) 9,900; cotton (raw) 2,680; livestock 352,000; 1938: hides, skins, 2 casings, 2,045,000 pieces. Communications: roads open to traffic (1940) c. 4,000 mi.; railways open to traffic (1944) 1,250 mi.; passengers carried (1943-44) 4,418,590.

Agriculture and Minerals.—Production 1938-39 (in short tons): wheat 860,000; rice 393,000; barley 1,251,400; tobacco 4,400; wool (1938) 9,100; cotton (1940-41) 3,960; cotton seed (1940-41) 9,350; petroleum, crude (1940) 3,781,000. (See also ARAB LEAGUE.)

Ireland: see EIRE.

Ireland, Northern. Northern Ireland comprises the six counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone; it forms part of the United Kingdom of Great Britain and Northern Ireland, but (after 1920) has its own parliament and executive (with limited powers for local purposes) although it is represented in the imperial parliament by 13 members. Area: 5,238 sq.mi.; pop. (census 1937) 1,279,745, (est. June 1939) 1,295,000. Chief cities (pop. census 1937): Belfast (cap., 438,086), Londonderry (47,813). Language: English; religion: Roman Catholic 33.75%, Presbyterian 31.4%, Episcopalian 27% (approx.). Governor in 1946: the earl of Granville; premier Sir Basil Brooke.

History.—In 1946 Princess Elizabeth visited Belfast and launched the aircraft-carrier "Eagle" on March 19. She was given an enthusiastic welcome.

The finance minister announced in his budget speech in May that agreement had been reached with the British treasury that Northern Ireland should be regarded as a development area and be given financial assistance on the same scale as other development areas in Britain.

The outstanding event of the year was the Ulster bank strike. Banking activity was paralyzed from July 12 until Aug. 17. Demanding higher salaries and speedier methods of negotiation, 1,450 bank officials struck on July 12; a national arbitration tribunal heard their case on Aug. 1 and made an award by which about 85% of the male officials would receive a net increase of from 3s. 3d. to 4s. 6d. a week, an award which the strike committee considered "totally unacceptable." The government then decided to test the legality of the continued strike by taking proceedings against certain officials but dropped the case when it was discovered that one member of the national arbitration tribunal had been a shareholder in a banking company. The strike was finally settled at a conference in Belfast, but the terms of settlement were not published.

On Feb. 6 the government was defeated in the senate by nine votes to seven on a housing bill amendment designed to allow subsidized houses to be sold. Bread rationing was introduced in July, but the British ministry of food scheme was boycotted by the roundsmen on July 22; they remained on strike until an amended scheme was introduced on Aug. 5. (J. RA.)

Education.—In 1944-45: elementary schools 1,667, scholars 185,621; secondary schools 76, scholars 18,854; university students 2,663; technical schools 61, students 24,890.

Trade and Communications.—External trade (1943): imports £102,125,000; exports £100,250,000. Communications (1943): roads used by motor traffic 13,192 mi.; railways, broad gauge 619.15 mi., narrow gauge 52.76 mi.; canals 88.5 mi.;

shipbuilding, tonnage launched (1943) (merchant ships more than 100 tons) 119,439; value of linen goods exported (1943) £3,680,000.

Finance.—Revenue (est. 1945-46) £22,000,000; expenditure (est. 1945-46) £21,785,000; public debt (March 1945) £3,113,000. Exchange rate (1946) £1 = 403.4 U.S. cents.

Agriculture.—Total area under crops and grass, June 1, 1945, 2,264,787 ac., including 947,456 ac. permanent grass, 531,606 ac. rotation grass, 447,848 ac. oats, 189,733 ac. potatoes and 80,295 ac. flax. Cattle 919,280; sheep 654,311; pigs 249,004; poultry 17,471,353. In 1944-45 cattle and sheep to the value of £2,983,000, eggs (£3,496,000), ware potatoes (£898,000), seed potatoes (£600,000) and fruit (£1,246,000) were shipped to Great Britain, and 3,900,000 U.S. gal. of milk were shipped to Great Britain in the winter months.

Irish Free State: see EIRE.

Iron and Steel. For convenience in coverage this subject is subdivided and handled under the three major heads—iron ore, pig iron and steel. Many new data became available for the production tables during 1946, but there were still gaps, especially from the enemy-occupied areas.

Iron Ore.—Table I presents the available data on the production of iron ore in countries having an output greater than 1,000,000 short tons.

Table I.—World Production of Iron Ore, 1939-45

International shipments of iron ore were resumed shortly after the close of the war in Europe, and there was a marked revival of activity in the ore exporting countries. Sweden was again exporting ore to England, and Chile and Cuba to the United States. Algerian exports were increased sharply in 1945, but Spanish Morocco was slower in recovery and Tunisia showed little change. Canada had developed an extensive export trade to the United States, even while still importing the bulk of the ore used in its own furnaces.

STEEL PRODUCTION in the United States, 1929-46: monthly average percentage of capacity (figures compiled by American Iron and Steel institute)

SCENE at the pouring of a "heat" from an open hearth furnace of a steel mill at Dearborn, Mich., in 1946

United States.—Supplementing the data in Table I, iron ore production in the United States decreased from 98,881,560 short tons in 1945 to 70,356,950 tons in the first ten months of 1946, with the year's total expected to run about 75,000,000 tons.

Canada.—After the opening of the Steep Rock deposit in western Ontario, Canada more than doubled in output. This new production is exported to the United States.

Pig Iron.—Table II presents production data from countries with outputs in excess of 1,000,000 short tons, so far as the figures were available.

Table II.—World Production of Pig Iron, 1939–45

(In millions of short tons)

Total	113	118	?	?	?	?	?

United States.—Blast furnace production declined 13% in 1945 as compared with the peak year of 1944. Normal production in 1946 was interrupted by steel and coal strikes, cutting the output for the first ten months to 36,909,344 short tons, equivalent to an annual rate of 44,500,000 tons. This figure was expected to be improved somewhat by the end of the year, possibly to as much as 46,000,000 tons.

Canada.—Blast furnace output declined 10% from the peak year 1942 to 1945, but dropped more sharply in 1946. Output during the first ten months was 1,202,884 short tons, 28% less than in the same period of 1945.

Great Britain.—When output in most other countries was declining in 1946, British output improved. The total for the first seven months was 5,025,400 short tons, an 8% increase over the average rate of 1945.

Belgium.—Production increased from 155,500 short tons in Jan. 1946 to 189,600 tons in June, with a total of 1,026,250 tons for the half year.

Czechoslovakia.—Production increased from 61,700 short tons in Jan. 1946 to 87,000 tons in June, with a total of 469,000 tons

for the half year.

France.—Production increased from 213,000 short tons in Jan. 1946 to 335,000 tons in July, with a total of 1,804,000 tons for the seven months.

Italy.—Conditions were still badly disorganized during 1946, with production even lower than in 1945.

Luxembourg.—Production increased from 84,000 short tons in Jan. 1946 to 137,000 tons in July, with a total of 754,000 tons for the seven months.

Poland.—Production in the first five months of 1946 was 315,000 short tons, one-quarter below the average rate for 1939.

Sweden.—Production in the first half of 1946 dropped 5% below the average rate for 1945.

Steel.—So far as data were received, Table III presents steel production in countries having an output greater than 1,000,000 short tons. Data for this table were culled from a variety of sources, and numerous estimates were included where official figures were lacking; the table can be considered only an approximation, to serve until more reliable data can be secured.

United States.—There was a decline of 11% in steel production in 1945, and it was anticipated that about this same level of operations would be needed in 1946, but production was cut in January and February by a steel strike, and again in May and November by coal strikes. As a result, output through Nov. 1946 was 60,631,782 short tons, and the year's total was expected to be something near 67,500,000 tons, a decline of 15% below 1945. Steel supplies were consequently short throughout the year, and the return to normal industrial operation was greatly hampered.

Canada.—Steel production dropped 7% from the peak of 1942 to 1945, and the decline became more pronounced in 1946. Output in the first ten months was 874,687 short tons, 24% less than in the same period of 1945.

Table III.—World Production of Steel, 1939–45

(In millions of short tons)

Great Britain.—There was a marked postwar improvement in production, with a total of 8,306,000 short tons in the first seven months of 1946, 8% over the average rate of 1945.

Belgium.—Production increased from 60,000 short tons a month at midyear of 1945 to 170,000 tons in Jan. 1946 and 200,000 tons in June, with a total of 1,110,000 tons for the half year.

Czechoslovakia.—Production increased from 35,000 short tons in June 1945 to 162,000 tons in May 1946, with a total of 870,000 tons for the first five months of 1946.

France.—Production increased from 60,000 short tons in Jan. 1945 to 255,000 tons in Jan. 1946 and 415,000 tons in July, with a total of 2,373,000 tons for the first seven months of 1946.

Luxembourg.—Production increased from 4,000 short tons in Jan. 1945 to 77,000 tons in Jan. 1946 and 130,000 tons in July, with a total of 920,000 tons in the first seven months of 1946.

Poland.—Production was revived early in 1945, and by the end of the year had reached 81,500 tons monthly. In 1946 output rose to 110,000 tons, with a total of 638,000 tons in the first five months.

Sweden.—Production in the first half of 1946 was 694,000 short tons.

Germany.—Production in the British zone of Germany was 1,100,000 short tons in the first half of 1946. (See also BUSINESS REVIEW; METALLURGY.) (G. A. Ro.)

Iron and Steel Institute, American: see SOCIETIES AND ASSOCIATIONS.

Irrigation. *United States.*—For the year 1946, the irrigation water supply of the 11 western states was generally good. In the Arizona-New Mexico area there was fear of drought because of a near critical shortage in the early irrigation season, but good rains in the late summer alleviated this condition. In parts of California the supply was below normal but not serious enough to become critical. There were no cases of crop damage or loss caused by water shortage reported from any of the irrigated areas.

At the close of the year 1946, prospects of an adequate irrigation water supply for 1947 were good. Areas of excessive runoff covered more than half of the western states. The flow of three representative streams set new high records for the month of November. In the northwest, including Montana, Idaho, Oregon and Washington, the outlook was for a normal or better supply. In Utah and Nevada the indications were for an above normal supply and in California and Arizona the fall season continued favourable. In Colorado and Wyoming the outlook was for a better water supply than any time in the past few years.

Both volume and value of crops produced in 1946, throughout the irrigated regions of the U.S. were higher than in 1945. Farm labour was adequate in most agricultural areas, although there were isolated cases of labour trouble resulting from strikes.

The two largest irrigation institutions for which crop statistics were available for 1946 returns were the U.S. bureau of reclamation and the Imperial Irrigation district, the former serving 4,125,000 ac. of irrigated lands and the latter 882,788 ac. The last crop report issued by the bureau of reclamation showed a yield for the year of 57,122,000 bu. of potatoes; 1,941,000 tons of sugar beets; 6,495,000 bu. of onions; 3,674,000 bu. of beans; 36,672,000 bu. of grain; and 49,000,000 bu. of truck crops; 4,360,000 tons of forage crops were also produced and 729,000 tons of fruits. During the year 1946, the Imperial Irrigation district had under cultivation 5,563,000 ac. of permanent crops such as citrus, dates, apricots and other

mixed fruits, 64,098 ac. of garden crops, of which 22,482 ac. were in cantaloup, 22,720 ac. in lettuce and the balance in various garden crops. There were 304,000 ac. of field crops cultivated of which 160,434 ac. were in alfalfa; 26,044 ac. in milo; 19,127 ac. in sugar beets; 54,179 in flax; and 66,677 in barley. The balance of the 304,000 was planted to various field crops.

During the fiscal year ending June 30, 1946, the bureau of reclamation awarded construction contracts totalling more than \$109,000,000 and most of the awards were made during the period Jan. 1 to June 30. Of the total of \$109,000,000 awarded during the fiscal year, 200 contracts involving more than \$55,000,000 were awarded during June 1946. The largest single unit covered in these contracts was the Granby dam and dikes to cost \$5,989,969. This dam was to be located on the Colorado river about 50 mi. northwest of Denver on the western slope of the Rocky mountains and was a unit of the Colorado-Big Thompson project. The dam was to be an earth fill structure 885 ft. long at the top and its crest would be 232 ft. above river bed. It would create a reservoir providing 482,000 ac. ft. storage for irrigation and for the production of 152,000 kw. of electric energy. The largest construction feature placed under construction during June 1946 was the Horsetooth reservoir, another unit of the Colorado-Big Thompson project. The \$9,431,000 contract for this feature includes construction of Horsetooth dam and Satanka dike, Soldier Canyon dam, Dixon Canyon dam and Spring Canyon dam. During Jan. 1946, the bureau awarded the contract for the construction of the Davis dam on the Colorado river near Kingman, Ariz.

Work was underway during 1946 on contracts preparatory to actual construction of the Hungry Horse dam on the Flathead river in Montana. This dam was to be a key unit in the broad program of full utilization of the waters of the Columbia river and its tributaries. Approximately 85,000 ac. of potentially irrigable land in the Kalispel area might be served through the project.

Contracts on most federal construction were held up by presidential order shortly after the beginning of the fiscal year but in a number of cases after a review of the entire construction program the letting of contracts was authorized. Something more than \$16,000,000 of the total award was to go toward construction of features of the Columbia Basin project. There was to be \$9,360,000 spent in the construction of features of the Potholes dam, which when completed would create a reservoir of more than 600,000 ac. ft. capacity. It was estimated that it would take about four years to complete the dam. About \$4,000,000 had been authorized for the construction of 13.5 mi. of the East Low canal and its appurtenant structures on the Columbia basin project. The canal was to be about 130 mi. long when completed. Also on the Columbia basin project commencement of construction on the Long Lake dam near Stratford, Wash., was undertaken.

On the Central valley project, California, work was started on the Delta-Mendota canal which was to carry Sacramento river water from the Delta to Mendota deep in the San Joaquin valley. The canal was to be 120 mi. long and was to be concrete lined. Water diverted from the pool created at the end of the canal would feed the irrigated lands formerly fed from the San Joaquin river, which would in turn be carried by the Friant-Kern canal to lands in Tulare and Kern counties. Work was also continuing on construction of the Friant-Kern canal.

Argentina.—In central Mendoza province of Argentina a dam to cost \$800,000 was projected for immediate construction. The dam was to be 80 ft. high and approximately 1,000 ft. long constructed of concrete about 50 mi. from the town of San Rafael on the Atuel river. In order to gain greater head the dam was to be located just above the falls at El Nihuel, thus permitting the development of 55,000 h.p. of electrical energy. An artificial lake with a surface of 20 sq.mi. was to be created impounding sufficient water to irrigate approximately 173,000 ac. of

alfalfa, fruit and vegetables.

Australia.—The government of western Australia was planning an extensive water supply program to increase available reserve for its agricultural area on condition that the commonwealth government aid the program financially by appropriating about \$2,000,000 annually for a period of ten years. The program would provide permanent water supply to the lands in the southwestern section of the state comprising about 12,000,000 ac. most of which was wheat land. The plan was to raise Wellington dam to increase the capacity of its reservoir from 23,000 to 116,000 ac.ft. and to raise Mundering Weir dam and increase its reservoir capacity from 14,000 to 46,000 ac.ft.

In Victoria state plans for what would be one of the largest single engineering projects ever undertaken in the country were underway. They provided for the expenditure of \$27,132,000 on enlargement of the Eildon weir. The plans were formulated by the Rivers and Water Supply commission and presented to the state government. The Eildon weir reservoir is located on the Goulburn river and when the weir is enlarged, the capacity of the reservoir would be increased from 306,000 ac.ft. to 2,235,000 ac.ft. The addition of an earth embankment 250 ft. high, 2,300 ft. long and consisting of about 13,000,000 cu.yd. of earth was planned. This would be one of the outstanding dams of the world if completed according to plans.

Iran.—From 1941 to and including 1946, considerable attention had been given to the problem of improving the Kanat system of Iran. There are probably 100,000 villages in Iran around which the principal agriculture of the country is concentrated in small farm tracts, and the principal source of water supply comes from underground through a network of Kanats that extend over the entire country with the exception of certain extensive desert areas. There were in 1946 no statistics revealing the number of villages or the number of Kanats that had been developed and there was no indication of the total length of these underground channels, but there must be about 300,000 of these Kanats since each village has from one to ten separate Kanat systems. Because of the importance of this feature of irrigation development, much attention had been and was being spent in working out and putting into operation plans for improving this network of underground channels.

Mexico.—The federal government of Mexico appropriated to the National Irrigation commission, 189,000,000 pesos for construction of irrigation works during 1946. This appropriation was a 15% increase over the appropriation for the same purpose during 1945. The commission was continuing work in the La Guna Irrigation district in the states of Coahuila and Durango where it expected to complete construction of the El Palmito dam on the Nazas river. The dam when completed would provide sufficient storage to irrigate 110,000 ha. In the state of Chihuahua in the Delicias Irrigation district work was continued in the Las Virgenes dam on the San Pedro river. This dam was to be 55 m. high when completed and would supply irrigation water to increase the irrigated area of the district from 20,000 ha. to 60,000. Also in the state of Chihuahua, construction was started on the El Tintero dam on the Santa Maria river to provide storage for 10,000 ha.

In the state of Colima plans were underway to build a diversion dam and a conveying canal to deliver water from the Coahuayana river to 10,000 ha. of irrigable land.

In the state of Guanajuato, the Alta Lerma Irrigation district was constructing the Solis dam to store flow from the Lerma river and by means of a network of canals, to irrigate 115,000 ha. The Salamanca canal of this network was completed during 1946 and would add 16,000 ha. to the area already cultivated by the district.

The Endo dam in the state of Hidalgo was started during 1946, designed to increase the irrigated area of the Tula and Ximiquilpan districts to 40,000 ha.

In the Lower Lerma Irrigation district in the state of Jalisco improvements were continued on irrigation and drainage works benefiting 50,000 ha. reclaimed from the Chapala lake. About 16,000 ha. additional were to be irrigated in Octolan by pumps. The foregoing are only some of the outstanding projects which were built or are being built by the National Irrigation commission. The commission put under cultivation by irrigation from 1926-40 more than 271,000 ha. From 1941-45 it added 359,822 ha. and during 1946 it would have added 324,000 ha., making a total of 954,822 ha. of irrigated lands. The value of crops produced by the irrigation districts created by the commission amounted to 371,000,000 pesos in 1945 which was about 40% of the agricultural production of the nation. It was estimated that crops produced on the areas included in the works completed by the commission up to the close of 1946 would raise the crops of 1947 to 50% of the total national agricultural production.

Union of Soviet Socialist Republics.—Construction of more irrigation canals in the Caucasus, Uzbekistan, Kazakstan, and Tajikistan was intended to produce home grown cotton, various foods and particularly subtropical culture in considerably increased quantities. A great reservoir was created at the site of the Mingeaur hydropower station located in Azerbaijan where the River Kura emerges from the foothills of the Caucasian mountain chain. The waters of the Kura and Arax were to be utilized to promote the development of irrigation agriculture by increasing the irrigated area by more than 300% or eventually to a total of 1,500,000 ha. This project was to be completed in 1948. The soviet government also reported starting work during 1946 on the river Amur-Darya (Uzbekistan) where irrigation development would be on an even greater scale. The irrigated acreage in Tajikistan was to be increased by nearly 100,000 ha. during 1946 and in Georgia a canal had been built on the right bank of the Kura. In 1945 the people of Stalingrad had completed works for the irrigation of 30,000 ha. of land recently liberated. In 1946 they were completing distributing systems to every collective farm.

Extensive irrigation work underway in the Uzbek S.S.R., was expected to open an additional 110,000 ha. to cotton cultivation during the following two years. An appropriation of 500,000,000 rubles was made by the U.S.S.R. government for this project. Almost all Uzbek cotton or, in fact, two-thirds of the soviet union's total crop is grown on irrigated land, opened to cultivation mainly during the last 25 years. During the prewar five-year plan periods about 60 new major irrigation installations and about 500 pumping stations were built in Uzbekistan to convey

waters of the glacial streams rising in the mountains for the irrigation of cotton fields. In 1939 the Great Ferghana canal, 349 km. in length, was built to divert irrigation water from the Syr Darya river. Because of the war, however, civil construction in the union was discontinued. During the year 1946 irrigation development was resumed everywhere and was being constantly expanded.

The Katta-Kurgan reservoir was among the first of the features which was to be completed and this project would bring into cultivation 65,000 ha. of formerly uncultivated land for the production of cotton. In addition it would provide sufficient water for the irrigation of 390,000 ha. of plantations suffering from water shortage. At the same time construction of the 100,000,000 cu.m. Urta-Tokai reservoir was to be rushed to completion.

Construction of the first section of the North Tashkent canal was to be resumed which when completed would supply water for the irrigation of large agricultural areas in the vicinity of Tashkent, the capital of Uzbekistan.

At the same time construction was being rushed on the Urta-Tokai reservoir in the Kirghiz republic of the U.S.S.R. This was a unit of the Central Asia five-year plan and when completed would store waters of the Chu river. The dam designed to create this reservoir would require placement of more than 3,000,000 cu.yd. of earth in the body of the dam and about 4,000,000 cu.yd. of other excavation. The dam was to be 187 ft. high, 1,600 ft. through the base and 1,000 ft. long on its centre line. Because of its location in a region of earth faults extra precautions were taken to guard against earthquakes. The reservoir would feed water to two canals which would convey water sufficient to irrigate 80,000 ha. of fertile lands.

Venezuela.—The government of Venezuela had under construction during 1946 a system of irrigation works near Cumana, making use of waters of Rio Manzanares in order to irrigate 2,500 ha. in the vicinity of the city of Cumana situated in the eastern part of Venezuela. Work had also been started on the construction of an irrigation system near Valencia. The system was to include storage of the waters of Rio Guataparo by means of an earth dam 28 m. high. The resulting reservoir would supply water for the irrigation of 2,800 ha. of land.

On Rio Motatan work was begun in 1946 on a storage system to irrigate 10,000 ha. situated in the region of Lake Maracaibo. (See also DAMS; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION.)

Islam. Another link was forged in the building up of a world organization for peace when in June 1945 at San Francisco Saudi Arabia signed the United Nations charter. As Arabia occupies a central place in the Islamic world, this marked a more than material step towards the world organization of peace. How far this action of Arabia would be followed by a strengthening of the peace movement in other parts of the Islamic world it was difficult to foresee, as every country of the Islamic world had its own immediate internal problems.

The Moslem situation in India was complicated in 1946 by the arguments for and against Pakistan. Originally "Pakistan" meant a federation of Moslem states in northwest India: Sind, Baluchistan, the Frontier province, the Punjab and Kashmir. But Kashmir was not in British India and although its population was predominantly Moslem, the ruling dynasty was not. In some quarters, Pakistan was understood to include Bengal in northeast India, with its large though submerged Moslem population. The Moslem league under Mohammed Ali Jinnah's leadership held a strong position in respect of Pakistan, but the new Indian government under Jawaharlal Nehru was endeavouring to work out a suitable compromise. Italian Colonial Empire. The future of the Italian colonies remained *sub judice* in 1946, pending a final settlement by the Council of Foreign Ministers. The problem came under discussion at the peace conference in Paris, but decision was postponed. On July 3 the foreign ministers adopted a draft article submitted by the British foreign secretary, Ernest Bevin, for inclusion in the peace treaty for Italy together with a draft declaration by the Four Powers. The draft article provided: (a) the renunciation by Italy of all rights to its former African colonies; (b) that those territories should continue under the existing administration pending final

decision; (c) that the final disposal of the territories should be decided by the Four Powers within one year of the signing of the treaty. The declaration laid down that the final disposal "shall be made in accordance with one or any combination of the following solutions. . . . (1) independence, (2) incorporation in neighbouring territories, (3) trusteeship, exercised either by the United Nations as a whole, by any one of them, or by Italy." Should the Four Powers fail to agree to any or all of these solutions the matter would be referred to the general assembly, whose recommendations the Four Powers would undertake themselves to accept "bearing in mind the pledges given to the Senussi by the United Kingdom."

The Italian government was allowed to submit its observations on this as on other problems. The main Italian argument was that the existing position implied that Italy must renounce its sovereignty before any decision was taken although, both *de jure* and *de facto*, the territories were still under Italian sovereignty; and that Italy must accept for one more year British military administration (and French for a small part). The Italian government contended that this surrender of sovereignty had no juridical justification, for, if Italy's sovereignty were cancelled by the treaty before decision, these territories (Libya, Eritrea, Somaliland) would become *res nullius*. In other words, the draft article implied a decision already taken against Italian interest, so that no continuity would take place between Italian sovereignty and the new juridical situation under the United Nations. The amendment proposed by Italy was to the effect that "the final disposal of Italy's territorial possessions in Africa . . . shall be determined jointly by the governments of the Four Powers according to the principles laid down in the San Francisco charter . . . pending such disposal the said possession shall continue under their present provisional administration and a fair share of this administration shall be entrusted to Italian officials according to international law."

The Italian argument was, however, set aside, and the draft article and declaration were carried as stated above. The decision thus meant that the existing British administration of Eritrea, Somaliland and Libya would continue for at least another year pending final disposal of the Italian colonies. This decision came as a painful surprise to the Italian people and roused national feeling. (See also ALBANIA; ETHIOPIA; PARIS PEACE CONFERENCE; YUGOSLAVIA.) (C. M. F.)

Italian Literature.

Among the cogent problems debated by Italian writers during 1945 and 1946, such questions as orthodox liberalism versus liberal socialism, spiritual freedom versus social freedom, art for art's

sake versus art for society, reached a boiling point and were clarified to some degree in 1946, during and after the referendum and the elections for the constituent assembly. One current was led by Benedetto Croce—*Pensiero politico e politica attuale* (Laterza)—and those of his followers who remained in his camp after the fall of fascism. The other was made up of two groups: the first, left of centre, which can be called "actionist"—C. Ruggero, *Difesa del liberalsocialismo* (Atlantica)—consisting in the main of Croce's former disciples, and the second, the extremist, led by the Marxists. In the political field the orthodox liberals and the "actionists," both lacking mass support, were defeated by the Marxists. However, while the influence of the liberals also suffered a general set-back along the philosophical and literary fronts, the "actionists" made headway, thus affecting other groups and blunting the impetus of the Marxist current. By the end of the year, the general impression was that the intellectuals had, in their vast majority, become fully aware that their isolation and aloofness from the political life of the nation was tantamount to a crime which they would be the first to expiate once freedom was lost; that liberty is not an abstract idea—a goddess to be kept on an unattainable pedestal—it must be within every man's reach, in other words, although they did not put it exactly this way, it consists of the four freedoms as enunciated by Franklin Roosevelt and which can be ensured for all through a socialist democracy; that art should not be solely by and for the few but should, insofar as it is possible, become popular and express the feelings of society. Be this as it may, the author should be inspired by and remain faithful to his inner voice; in no event should inspiration be imposed upon him from the outside or dictated from above.

This new awareness was especially manifest in the periodical press in which philosophers, historians, scientists, novelists and artists examined and discussed the moral, political and economic problems which beleaguered the new Italian republic. Though still somewhat early for a conclusive judgment, evidences of this new awareness appeared in the creative field and particularly in the novels of a number of new writers. Silvio Micheli in *Pane duro* (Einaudi) detailed in a fevered style the frustrations of the white-collar worker and his desperate urge for life, freedom and happiness. The spiritual struggle of modern man, his dramatic protest against a society impotent to solve the present world crisis, and his unavailing efforts to survive in order to live a full life, were powerfully expressed by Carlo Coccioli in *Il migliore e l'ultimo* (Vallecchi), B. Joppolo in *La giostra di Michele Civa* (Bompiani) and G. Piovene in *Pietà contro pietà* (Bompiani). Conversely, there

was as yet no trace of this new trend in the prose works published during the year by such well-established writers as M. Moretti, *I coniugi Allori* (Mondadori); F. Palazzi, *La città* (Ultra); G. Stuparich, *Ginestre* (Garzanti); O. Vergani, *Un giorno della vita* (Garzanti); F. Pea, *Lisetta* (Mondadori); G. Anguissola, *Farai un viaggio* (Rizzoli); L. Bigiaretti, *Il villino* (Garzanti) and T. Landolfi, *Le due zitelle* (Bompiani). Considerable interest was aroused by R. di San Secondo's *Incontro di uomini e di angeli* (Garzanti) which is interpreted as the author's departure from the *grottesco* which had made him famous.

The output of autobiographical material dealing with life in nazi-fascist prisons, the resistance movement and partisan brigades continued unabated. Nor is this a strange phenomenon since the Italian intellectuals who participated in the fight for Italy's freedom numbered in the hundreds. It is impossible to list the many noteworthy books in this field, remarkable especially for the loftiness, serenity and objectivity with which even the most inhuman episodes were handled. Most typical of the genre is L. Bolis' *Il mio granello di sabbia* (Einaudi). In their turn, diplomats, generals and journalists (L. Simoni, Galeazzo Ciano, U. Spigo, Pietro Badoglio, Mario Roatta, Q. Armellini, D. M. Tuminetti, etc.) described and analyzed the political and military events in which they had played a part and which had led Italy to disaster.

A striving for clarity characterized the field of poetry, especially on the part of the more obscure among the "hermetic" poets. Vincenzo Cardarelli and Salvatore Quasimodo each published a collection of new poems (Mondadori, Costume); Mondadori also published a small volume of Ada Negri's posthumous verse. However, the poet who gathered most of the critics' laurels was Umberto Saba whose *Canzoniere* (Einaudi) appeared in final edition. The growing interest in poetry was evidenced by the frequent publication of *opera omnia* such as Giuseppe Ungaretti's *Vita d'un uomo* (Mondadori), anthologies such as G. Spagnoletti's *Antologia della poesia italiana contemporanea* (Vallecchi) and international reviews such as E. Falqui's *Poesia* (Mondadori).

Literary critics displayed great activity. Especially distinguished were the original or collected essays on classic and modern Italian literature by Croce, Giuseppe Toffanin, Luigi Russo, Francesco Flora and Pietro Pancrazi. Much discussion centred on the first volume (*Inferno*, Sansoni, 1945) of F. Momigliano's excellent aesthetic commentary on the *Divina Commedia*.

The literary prizes of the year went mostly to new and young writers. The "Viareggio" was split between S. Micheli for *Pane duro* and Saba for *Il canzoniere*; the "Darsena Nuova" was awarded to R. Modigliani for his novel *Uccidere il re* (Tatra) and the "Costume" to G. Manzini for her novel *Lettera all'editore* (Mondadori, 1945).

Italian Possessions in Africa: see ITALIAN COLONIAL EMPIRE.

Italy.

A republic in Europe, consisting of: the Po valley, ringed by the Alps where it borders on France, Switzerland, Austria and Yugoslavia; the Italian peninsula; Sicily, Sardinia and minor islands in the central Mediterranean. Flag, three equal vertical stripes of green, white and red. Area (according to pre-World War II treaties) 119,733 sq.mi.; pop. (est. July 1, 1943) 45,681,000. Chief cities (census of 1936): Rome (capital), 1,150,589; Milan, 1,115,848; Naples, 865,913; Genoa, 634,646; Turin, 629,115. Religion of the state, Roman Catholic. Rulers: Provisional head of the state (after July 1, 1946), Enrico de Nicola. Victor Emmanuel III was king,

ITALIANS READING newspaper reports of the plebiscite of June 2, 1946, which terminated the monarchy and led to the establishment of a new republic

July 29, 1900, until his abdication May 9, 1946; Humbert II, king, May 9 to June 13.

History.—The year 1946 was a period of transition for Italy: of preparation of a treaty of peace by the Allies which would remove Italy from the status of co-belligerent into that of a member of the international community; of conversion from the institutional forms of monarchy to the permanent basis of a republican constitution.

On Jan. 7 the government (the council of ministers and the lieutenant general of the realm) issued the new provisional law on local government, based essentially on the pre-fascist law of 1915. At the insistence of the Allied commission provision was made for preliminary nomination of candidates, and for the prohibition of electioneering within 650 ft. of the polling places. The local elections, in which women voted for the first time, were staggered; March 10, March 24 and April 7; and took place in 5,638 communes out of a prewar total of 7,339. Socialists and Communists gained majorities in 40% of the communal elections; Christian Democrats in 35.4%; the remaining 24.6% was shared by all other parties.

There was much debate in the consultative assembly and in the council of ministers regarding the laws on the national election which would resolve the institutional question. The decree-law No. 151 of June 25, 1944, on the basis of which the council of ministers and the lieutenant general exercised sovereign power, had provided for a constituent assembly to determine the new form of the state. The amplifying law of March 10, 1946 (*Decreto-Legge Luogotenenziale* No. 74), provided for an assembly of 573 members, elected by universal suffrage, and by proportional representation. The whole country was divided into 31 electoral districts, with a minimum of 7 seats (Potenza—Matera), and a maximum of 36 (Milan—Pavia). The Val d'Aosta, which had been granted a special statute of autonomy, constituted a separate district with one seat for its 83,455 inhabitants.

The leftist parties had insisted that the constituent assembly be "sovereign," i.e., that it alone decide the issue of monarchy or republic, and that when convened it have all power for all purposes. Rightist elements demanded a plebiscite whose outcome would determine the fate of the monarchy. They suggested also a compulsory vote with severe penalties for non-

voters, a proposal even more obnoxious to the parties of the left than the referendum. The result was a compromise: a plebiscite to be held simultaneously with the election of the constituent, but without penalties for nonvoters. The assembly was to determine either a republican or monarchic constitution in accordance with the majority in the referendum. Ultimate political authority was vested in the constituent assembly to which the council of ministers was to be responsible; but the cabinet was to continue as the governing authority during the eight-month period of the assembly's sessions, and to have power to issue decrees with the force of law on all subjects save international treaties, elections and constitutional matters (*Decreto-Legge Luogotenenziale* No. 98, March 16, 1946).

On May 9 Victor Emmanuel III formally abdicated, hoping thus to aid the monarchical cause, and the move was denounced by republicans as a violation of the institutional truce. The old king left for Egypt; Humbert II as the new king exercised no more actual power than he had enjoyed (from June 5, 1944) as lieutenant general of the realm. As the date for the national election approached, there was something of a trend in favour of monarchy on the part of many who feared that a republic would merely pave the way for communism. Monarchist elements attempted in vain to gain the intervention of the Allied commission in favour of postponement of the referendum.

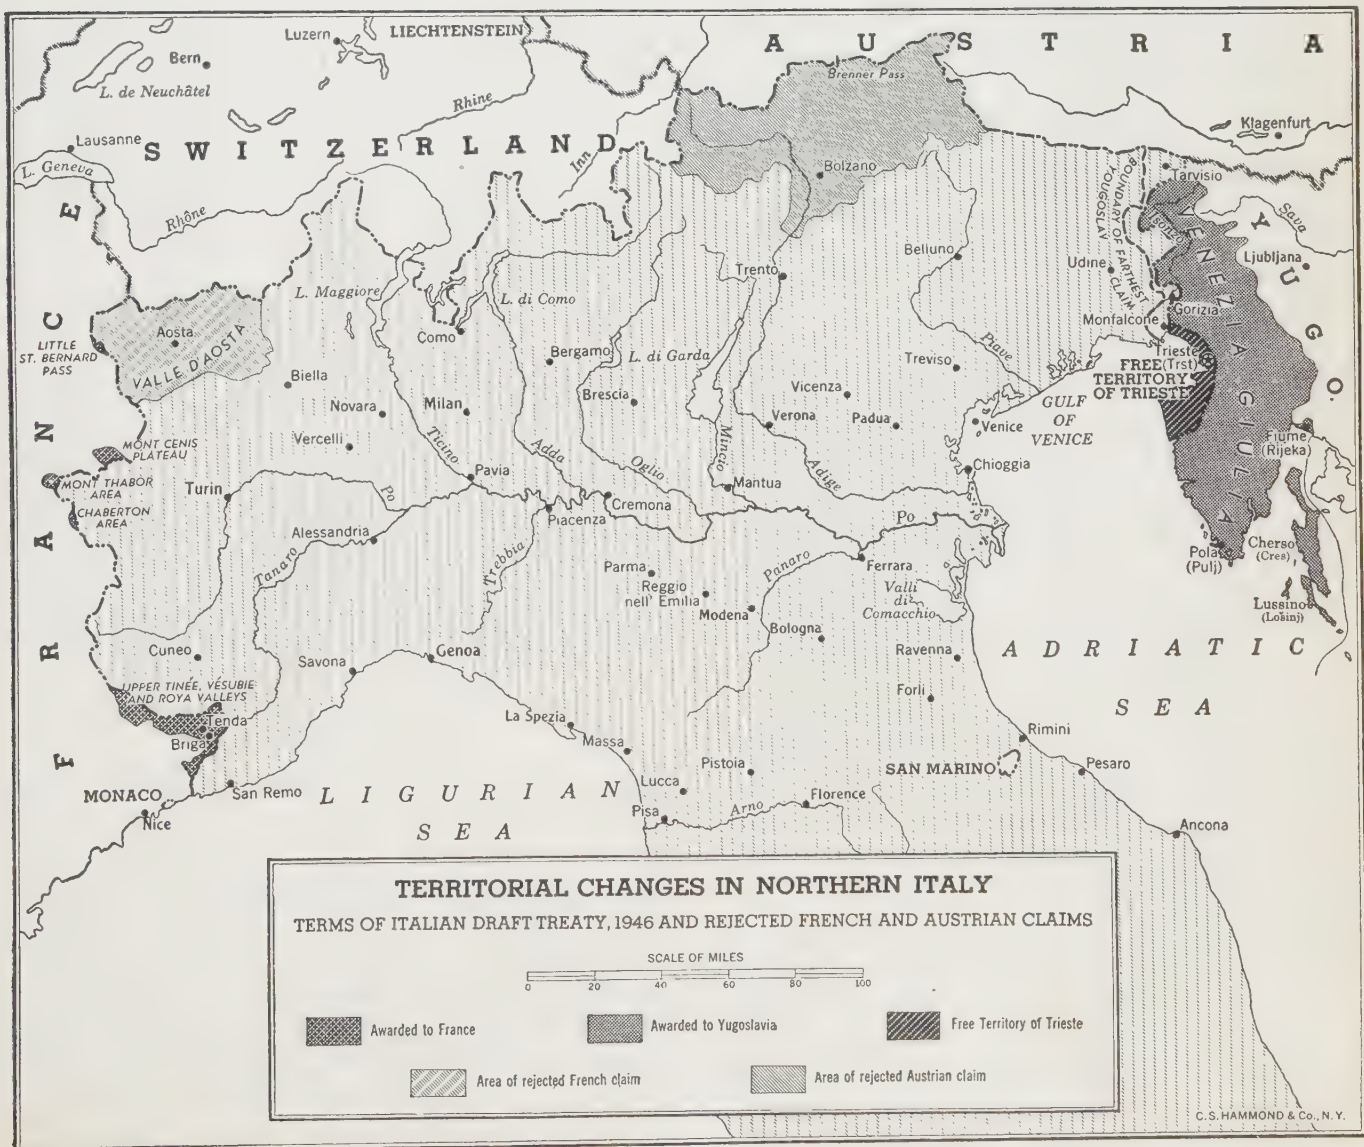

The election, held on Sunday, June 2, was conducted with

surprising good order, considering the feeling aroused by the issue and the unfamiliarity of most Italians with electoral processes. The Italian people gave a clear, but not overwhelming, verdict in favour of a republic. Final returns, as announced by the court of cassation (June 18) were as follows:

For a republic	12,717,923
For monarchy	10,719,284
Voided ballots	1,498,139
Total of votes	24,935,343

Lazio and all the southern regions (Puglie, Campania, Lucania, Calabria, Sicily and Sardinia) favoured the monarchy; all the northern regions (Piedmont, Lombardy, Liguria, Veneto, Emilia, Marche, Tuscany, Venezia Tridentina) favoured a republic.

The clear majority in favour of a republic was apparent within a couple of days after the election. Monarchist elements, however, promptly raised charges of irregularities. The court of cassation insisted on examining these charges before formally proclaiming the electoral results; in default of such formal proclamation King Humbert remained, unwilling, so he said, to desert his followers who were thereby encouraged to violence. Twelve persons were reported killed and scores injured as a result of monarchist demonstrations in Naples. The council of ministers determined, on June 13, that its president, Alcide de Gasperi, had legally succeeded to the position of temporary head of the state and invited Humbert to respect

his promise and leave. The next day (June 14) Humbert flew to Portugal to join his family.

The constituent assembly, which convened in Rome on June 25 under the chairmanship of Vittorio Emanuele Orlando, had no representatives for Udine province and Venezia Giulia, so that its total membership was 556 with the following party affiliations:

Christian Democrats	207	35.2%
Socialists	115	20.7%
Communists	104	18.9%
Rightists and Liberals	121	21.4%
Other parties	9	3.8%

Giuseppe Saragat was elected president of the constituent assembly, and at the third session (June 28) Enrico de Nicola, a southerner, was elected provisional head of the state (*Capo provvisorio dello Stato*). After his formal inauguration on July 1, Premier de Gasperi presented the resignation of the ministry and was commissioned to form a new one which, completed on July 13, was given a vote of confidence, 388 to 53, on July 25.

At its eighth session (July 19) the assembly constituted two committees for its principal problems: a committee on international treaties; and a committee to prepare a draft of the new constitution. The constitutional committee of 75 members in turn established three subcommittees: (1) on citizens' rights and duties; (2) on the structural form of the state; (3) on economic and social provisions. The preliminary drafts and discussions of the subcommissions indicated a general agreement of the parties to decentralize the state on a regional basis, and agreement that each region should have representation in the senate and a legislative body of its own. Andrea Finocchiaro-Aprile, leader of Sicilian separatism, failed to secure assent to his plan for complete federalism. Great differences were revealed between those of Marxian persuasion who considered the chief purpose of the new constitution to be an instrument of social and economic justice, and the more conservative elements who wished to emphasize traditional guarantees of individual liberties. The draft of the second subcommittee foreshadowed a bicameral legislature: a chamber of deputies popularly elected for four years with one deputy per 150,000 inhabitants; and a senate, half of whose members, elected for six-year terms, would be renewed every three years. Senators would represent the regions, and also the academic councils, the universities and national syndicates. Chamber and senate together would constitute the National assembly with power to elect the president of the republic, to declare war and conclude treaties. The executive power would be exercised in the name of the president by ministers politically responsible to the chamber. The independent judicial power would be headed by a supreme council of magistrates elected by judges of all grades.

The continued economic distress and disappointment with the peace negotiations was reflected in the supplementary local elections held in the autumn in which gains were scored by the Socialist and Communist parties which on Oct. 24 agreed on a unity of action pact.

On Oct. 19, Pietro Nenni, Socialist leader and advocate of the pact, took over the ministry of foreign affairs from De Gasperi who remained premier.

The Italian peace treaty was the subject of protracted negotiations: by the council of foreign ministers who resumed their discussions at Paris, April 25; by the Paris plenary conference (July 29-Oct. 25) which prepared a comprehensive draft; and again by the foreign ministers at New York (Nov. 4-Dec. 12) who completed the draft for signature at the Moscow meeting scheduled for March, 1947. Italian armed forces were to be limited to: an army of 250,000 (including 65,000 carabinieri);

a navy of two battleships, four cruisers, 40 auxiliary craft and maximum personnel of 22,500; and an air force of 350 planes of all types.

In New York reparations were scaled down to: \$125,000,000 to Yugoslavia; \$105,000,000 to Greece; \$25,000,000 to Ethiopia; and \$5,000,000 to Albania.

Italy was to be required to renounce all claims in Ethiopia and Albania, to cede the Dodecanese to Greece and four small Alpine areas to France. Libya, Eritrea and Italian Somaliland were to be transferred to the U.S.S.R., U.K., U.S.A. and France, which powers would be obliged to determine within one year the ultimate fate of Italy's colonies. The plenary conference accepted the recommendation of the Council of Foreign Ministers on the crucial problem of Istria: the "French Line" as the western frontier of Yugoslavia thus depriving Italy of the major part of the peninsula; the Free Territory of Trieste to be carved out of the area west of the French line; its integrity and independence to be guaranteed by the Security council of the United Nations.

A statute for the Free Territory of Trieste, carefully defining the powers of its governor, was finally agreed on by the Big Four in December.

(See also ALBANIA; ANTI-SEMITISM; COUNCIL OF FOREIGN MINISTERS; FASCISM; ITALIAN COLONIAL EMPIRE; NAVIES OF THE WORLD.)

Education.—There were 139,571 elementary schools; 5,110,328 pupils (1941-42); 5,136 secondary schools; 556,260 students (1940-42); 35 universities and institutes (29 royal and 6 private) with 164,863 students (1942-43).

Defense.—The treaty would limit Italy to: an army of 185,000 and 65,000 carabinieri with no more than 200 medium and heavy tanks; a navy of 2 battleships, 4 cruisers, 4 destroyers, 16 torpedo boats, 20 corvettes and a total personnel of 22,500; an air force of 200 fighter and reconnaissance planes, 150 transport and training planes and a total personnel of 25,000. Budgets for July 1946 to June 1947: army, \$562,668,320; navy, \$236,255,196; ministry of aviation, \$99,805,500.

Finance.—The monetary unit is the lira, official rate (1946) 100 to the U.S. dollar. Revenue (1944-45) \$948,860,000 (July 1945-Jan. 1946) \$1,399,930,000; expenditure (1944-45) \$3,681,420,000 (July 1945-Jan. 1946) \$1,717,760,000. Public internal debt (Jan. 31, 1946) \$9,561,990,000. Bank notes in circulation (April 30, 1946) \$2,916,396,000 and A.M. lire \$914,510,000. The reserve of the *Banca d'Italia* (April 1946) was \$5,258,000, and there were 365 banks with deposits of \$4,840,140,000.

Trade and Communication.—For the period Jan. 1 to May 27, 1946, exports were \$148,801,590; imports were \$300,028,380. Chief articles of export: fruits, wines, textiles (silk, artificial silk, cotton, rayon), essential oils and perfumes, vegetable materials. Chief articles of import: coal, grain and foodstuffs, cotton, wool, oil. Chief nations exported to (in sequence): U.S., Switzerland, U.K., Sweden, France. Imports from (in sequence): U.S., Switzerland, Spain, Brazil, U.K.

State railways in operation (April, 1946) 9,284 mi. Tonnage (1939-40) 55,931,062, (Nov. 1945-April 1946) 13,881,635. Passengers carried (1939-40) numbered 122,475,448, (Nov. 1945-April 1946) 53,074,075. Private railways in 1944 totalled 3,096 mi., carried 236,539,000 passengers and 8,149,900 tons. Automobiles, motorcycles, and trucks licensed in 1942 numbered 549,307; telephones (1942) 835,700; telegraph lines (1942) 42,936 mi. There were 16 maritime coastal radio stations in 1942 and 1,764,409 radio sets; in 1945, 1,596,431 radio sets.

Agriculture.—Chief crops: wheat, other cereals (corn [maize], oats, barley, rye, rice) beans, potatoes, tomatoes, sugar beets, hemp, flax, grapes, olives, oranges, lemons.

Agricultural Production in Italy, 1946-1945

(in short tons)

Crop	Est. 1946	1945
Wheat	6,625,098	4,617,996
Oats	509,011	277,280
Barley	256,727	139,428
Rye	121,966	85,781

Other production figures, with 1936-39 average and 1945 actual: grapes, 6,840,900 and 5,634,310 short tons; olives, 1,575,860 and 730,070 short tons; oranges, 358,050 and 292,600 tons; lemons, 359,590 and 241,670 tons.

Jackson, Robert Houghwout

(1892—), U.S. jurist, was born Feb. 13 at Spring Creek, Pa. Following his graduation from Albany Law school, he was admitted to the New York bar in 1913 and practised law in Jamestown, N.Y. He served as U.S. assistant attorney-general (1936-38) and as solicitor-general of the U.S. (1938-39). In Jan. 1940, President Roosevelt named him U.S. attorney general, and on June 12, 1941, he was made an associate justice of the U.S. supreme court. On May 2, 1945, President Truman named Justice Jackson as chief U.S. counsel on the international military tribunal to try axis war criminals. The trials got under way Nov. 20, 1945, at Nuernberg, Germany, and, acting as chief prosecutor for the U.S., Jackson made the initial statement for the prosecution, charging that the nazi defendants on trial were responsible for World War II.

Jackson made a brief foray into U.S. domestic politics by issuing a statement at a Nuernberg press conference, June 10, attacking Associate Justice Hugo Black for having participated in decisions that affected a former law partner; Jackson warned that continuation of such practice would bring the supreme court into "disrepute."

Commenting on the tribunal's verdict in the Nuernberg trials, Jackson disagreed, Oct. 1, 1946, with the acquittals of Franz von Papen and Hjalmar Schacht and the court's verdict absolving the German general staff. His formal resignation as chief U.S. prosecutor was made public Oct. 16.

Jamaica.

A British crown colony, the largest and most populous of British possessions in Middle America. The island is situated about 150 mi. south of the eastern end of Cuba. Jamaica has two political dependencies, the Cayman Islands, situated about 300 mi. northwest of Jamaica, and the Turks and Caicos Islands, situated about 600 mi. northeast of Jamaica. Area, 4,470 sq.mi.; pop. (1943 census), 1,237,063. The area of the Cayman Islands is 93 sq.mi. and their population 6,670; Turks and Caicos have an area of 202 sq.mi. and a pop. (1943 census) of 6,138. The population is estimated to include 77% Negroes and 18% mulattoes. The capital and principal city is Kingston (pop., 1943 census, 109,056); other towns include Spanish Town (12,007), Montego Bay (11,547), and Port Antonio (5,482). Governor in 1946: Sir John Huggins.

History.—Strikes at Kingston in Feb. 1946 resulted in several days of a "reign of terror" during which three persons were killed. Fire broke out on Feb. 17 in an insane asylum affected by the strike, with a resulting loss of life of 15. Gov. Huggins declared a state of emergency on Feb. 18. The general strike ended March 10, but further violence flared early in July. The fire in the insane asylum led to the arrest of W. A. Bustamante, leader of the majority party in the house of representatives and minister of communications, and F. Pixley, minister of social services; the two were charged with having incited the demonstration which resulted in the fire, but were acquitted June 30 after a 13-day trial. A midsummer strike against the Jamaica Shipping association was settled July 28. Considerable numbers of Jamaicans who had gone to the United States for wartime employment were repatriated during the early months of 1946, thus adding to the chronic labour difficulties.

Education.—Jamaica at the beginning of 1944 had 668 elementary schools with 164,000 pupils; the cost of elementary education in 1943-44 was £505,720. The ten-year development plan approved for Jamaica in 1946 assigned £3,681,852 for educational expenditures. The government in 1946 studied the possibility of establishing a medical school in the island. Plans also progressed for the setting up of a West Indian university in Jamaica.

Finance.—The monetary unit is the pound sterling, tied to

the pound in London. The much-publicized ten-year development plan, approved in 1946, contemplated expenditures of £19,583,750, an unallocated sum of £500,000, and debt charges of £1,574,000, a total of £21,657,750; Jamaica's share was set at £15,000,000, with the British government contributing about £6,500,000. Among the items of expenditure were £5,992,723 for public health and £2,018,114 for social welfare.

Trade and Communication.—The imperial government in the first nine months of 1946 bought 4,432,948 stems of Jamaican bananas and shipped 4,142,804 stems, about 70% going to Great Britain and most of the rest to Canada. Total banana exports for 1946 were expected to reach 12,000,000 stems. Sugar exports in 1945 were 117,830 long tons (1944: 131,947 tons).

Railway and highway mileage were approximately 300 and 2,525, respectively. The ten-year plan included an item of £1,500,000 for road construction and a total of £2,074,993 for improving all forms of communication. Both Pan American Airways and K.L.M. (Royal Dutch Airlines) expanded their services to Jamaica in 1946. The tourist trade had almost reached prewar levels by March 1946.

Agriculture.—Estimates of banana production for 1946 and 1947, respectively, were 6,000,000 and 7,000,000 stems. The banana industry was seriously affected in 1946 by the Sigatoka disease. The government consequently planned to send agricultural investigators to Burma, Siam and Indo-China to attempt to find wild, disease-resistant strains for breeding. Sugar production in 1945-46 was 161,620 long tons (1944-45: 152,226 tons); the estimate for 1946-47 was 176,000 tons. The 4-H club program was introduced into Jamaica from the United States in 1946.

Japan.

An island nation in the western Pacific, under inter-Allied military occupation following its defeat and unconditional surrender on Aug. 14, 1945. In accordance with the terms of the Cairo and Potsdam declarations of 1943 and 1945, Japan was stripped of its former overseas possessions and reduced to the four main islands of Honshu, Hokkaido, Shikoku and Kyushu (total area 146,690 sq.mi.) and certain minor adjacent islands. The population of Japan was officially estimated at approximately 74,000,000 in April 1946. By the end of 1946 it exceeded 76,000,000 as a result of natural increase and the repatriation of civilians and members of the armed forces from Korea, China, southeast Asia and the Pacific islands. On Oct. 23 Allied authorities announced that 4,932,584 Japanese nationals had been returned to the home islands, repatriation being virtually completed except from soviet-controlled territories. Repatriation from the latter areas, where Japanese nationals were estimated to number not less than 700,000, began on a limited scale in November.

The chief cities of Japan with 1940 populations are as follows: Tokyo (capital) (6,778,804); Osaka (3,252,340); Nagoya (1,328,084); Kyoto (1,089,726); Yokohama (968,091); Kobe (967,234). As a result of air raids in 1945, city populations were greatly reduced by evacuation to the countryside, Tokyo's population dropping to 2,780,000. As much as 40% of the built-up area of 66 cities was destroyed, including 30% of all urban housing in Japan. Following the surrender, a return movement to the cities set in, and total urban population increased from 19,500,000 in Nov. 1945 to 22,200,000 in April 1946.

The Japanese sovereign is Emperor Hirohito. Baron Kijuro Shidehara was prime minister from Oct. 1945 to April 1946. In May he was succeeded by Shigeru Yoshida. In 1945 there were 17,613,000 adherents of Shinto sects in Japan and probably

well in excess of 40,000,000 Buddhists.

History.—Throughout 1946 Japan continued under Allied military occupation. Governmental administration remained in Japanese hands, but policies were required to conform to the principles and objectives of the occupation as determined by inter-Allied agreement and implemented by the supreme commander for the Allied powers in Tokyo, Gen. Douglas MacArthur. The year witnessed the introduction of sweeping reforms in Japanese government and politics designed to eliminate militaristic and ultranationalistic influences and to foster democratic institutions. These political reforms were paralleled by comprehensive measures aimed at curbing the power of the great financial combines and improving the position of the Japanese worker and peasant. First steps were taken toward a program of reparations and disarmament which would strip Japan of a large part of its war-expanded heavy industries. Economic recovery was hampered by uncertainty as to the extent of such industrial removals, as well as by food shortages, mounting inflation and other obstacles to the revival of industry and trade. The history of 1946 is therefore the history of occupation policy and of the efforts of the Japanese people to readjust their institutions and attitudes to the new circumstances of defeat and Allied control. As the year ended it was apparent that extensive progress had been made toward the fulfillment of occupation objectives, but the depth and permanence of such changes and the ultimate orientation of Japan in the postwar world were yet to become evident.

Occupation Machinery and Controls.—The basic declarations and agreements governing the Allied occupation of Japan during 1946 were as follows: (a) the Potsdam declaration of July 26, 1945, defining the Allied terms of surrender; (b) the instrument of surrender of Sept. 2, 1945, by which Japan accepted the Potsdam terms; (c) the Moscow agreement of Dec. 27, 1945, establishing the Far Eastern commission (in place of the Far Eastern Advisory commission) and the Allied Council for Japan and (d) the U.S. Post-Surrender Policy for Japan, dated Aug. 29, 1945, which erected on the foundation of Potsdam a basic charter of occupation policies pursued by the United States in ensuing months and tacitly accepted by the Far Eastern commission following its organization.

On the creation of the Far Eastern commission and the Allied Council for Japan, the United States ceased to exercise sole responsibility for occupation affairs in Japan. The commission was empowered under the Moscow agreement to determine occupation policies; the U.S. government transmitted its decisions to the supreme commander in Tokyo and the latter, under directives from the U.S. joint chiefs of staff, was responsible for execution. The commission was composed of representatives of China, the United Kingdom, the U.S.S.R., the U.S., France, the Netherlands, Canada, Australia, New Zealand, India and the Philippines. The first four enjoyed the right of veto. The commission met weekly in Washington under the chairmanship of the U.S. member, Maj. Gen. Frank R. McCoy (ret.). Simultaneously in Tokyo sat the Allied Council for Japan, composed of representatives from China, the U.S.S.R. and the United States and a British commonwealth member representing the United Kingdom, Australia, New Zealand and India. It was charged with responsibility for consulting with and advising the supreme commander in the carrying out of occupation policies.

The military forces of the occupation remained predominantly U.S., supplemented by a small force of troops from the United Kingdom, Australia, New Zealand and India. A division of Chinese troops was reported to be expected in 1946 but failed to arrive. The supreme commander's functions were exercised through a general headquarters in Tokyo, which trans-

mitted directives and memoranda to the Japanese government embodying orders or suggestions from the supreme commander.

Political and Constitutional Reform.—On the initiative of the occupation authorities, extensive changes were undertaken in Japanese political life in 1946. The supreme commander's directive of Jan. 4 led to a series of political purges banning from public office and active political life many thousands of persons classified as militarists and ultranationalists. On April 10 the first postsurrender diet election brought 26,600,000 voters, or 72.1% of the registered electorate, to the polls. Noteworthy were the participation of women as voters for the first time in Japanese history and the election of 38 women to the diet. The two conservative parties, the Liberals and Progressives, though crippled by the political purge, managed to secure the largest representation in the new diet, the former with 140 members and the latter with 93 members. Next came the Social Democrats with 92 members. The remainder of the 464 elected members represented the smaller parties, among them the Communist party with 5 seats. Following the election Baron Shidehara struggled to reform his cabinet to remain in power, but strong public dissatisfaction with his policies forced his resignation. Succession by the leader of the Liberal party, Ichiro Hatoyama, was forestalled by his belated purge at the insistence of the supreme commander. On May 22 the premiership was assumed by Shigeru Yoshida, foreign minister in the outgoing cabinet, who simultaneously took over the presidency of the Liberal party. The Yoshida cabinet was dominated by conservative influences and drew its membership largely from the Liberal and Progressive parties. In ensuing months, under continual prodding from Allied headquarters, it proceeded to widen the scope of political and economic reforms, preparing and carrying through the diet a number of new measures, including the new constitution. However, its conservative policies with respect to price and wage control, inflation and unemployment relief failed to attract strong public support, especially in the cities. As the year drew to a close, mounting opposition

"THE NEW ORDER IN EAST ASIA" drawn by Cecil Jensen of the *Chicago Daily News* in 1946

to the government by labour groups was reflected in strikes, public demonstrations and attacks in the diet by Social Democrat and Communist members.

Early in the occupation the supreme commander made it known that revision of the constitution of 1889 was required under the terms of the Potsdam declaration. A new and more democratic constitution was accordingly drafted by the Japanese government and approved by Gen. Douglas MacArthur in March 1946. After passage by the diet with certain amendments, it was promulgated on Nov. 3 to take effect six months later. Under the new charter, war is renounced as well as the maintenance of all armed forces. The emperor, who on Jan. 1 publicly denied his divinity, is retained as a national symbol but virtually stripped of political power. Sovereignty is vested in the people, with a popularly elected house of representatives as the supreme law-making body, able if necessary to over-ride the upper house of councillors. Full cabinet responsibility to the diet is provided. An extensive bill of rights is enumerated.

The trial of Japanese war criminals by Allied courts continued throughout 1946. Numerous lesser cases were disposed of by military courts in Japan and elsewhere. In Tokyo the International Military Tribunal for the Far East began in April the trial of 28 top-ranking military and civil leaders for "crimes against peace and Humanity." (See WAR CRIMES.)

Education.—In 1944-45 Japan had 34,610 primary (elementary and youth) schools with 15,530,272 students; 4,175 secondary, middle and vocational schools with 2,276,227 students; 493 normal and "higher" schools and colleges with 327,363 students and 49 universities with 64,478 students. By the time of Japan's surrender, education was so disrupted as to be virtually at a standstill and about 4,077 schools had been totally or partially destroyed by bombing. Prompt action was taken by the occupation authorities to rehabilitate the educational system under directives designed to purge the curriculum and teaching staff of militaristic and chauvinistic influences. The directive of Dec. 15, 1945, separating Shinto from state support, barred Shinto doctrine from the schools. Objectionable textbooks were banned, to be replaced during 1946 by new ones which omitted mythological accounts of the "divine origin" of Japan and gave a straightforward narrative of World War II. Screening of teachers proceeded slowly, only 1,284 out of about 213,666 examined having been purged as of October. Other educational reforms fostered by Allied headquarters included language simplification, decentralization of educational controls and improvement of teaching methods.

Economic Disarmament and Reform.—Following complete demobilization and disarmament of the Japanese armed forces by the supreme commander, the Far Eastern commission took a second major step toward disarmament of Japan in May and June 1946 by approving an interim program for removals of heavy industrial equipment from Japan. This program made available as reparations to Allied countries all but 3,500,000 tons of Japan's 12,000,000-ton capacity in steel ingot production, half of its thermal electric power plants, all of its arsenals, aircraft and light metal factories and a large portion of its productive capacity in heavy chemicals, shipbuilding, machine tools, etc. Actual removals of equipment were delayed through 1946, however, by the failure of the commission to reach agreement on the allocation of reparations shares among claimant countries. The long-term demilitarization of Japan was proposed by the United States government early in 1946 in a draft treaty offered for consideration to the governments of the United Kingdom, China and the U.S.S.R.

Within Japan a number of notable economic reforms were instituted under Allied direction. The new Trade Union act,

effective March 1, legalized the status of trade unions and led to the mushrooming of membership to a figure of 3,745,642 workers in 12,324 unions on July 1. By Sept. 1, 452,000 workers were covered by collective bargaining agreements. Other new bills, advancing through various stages of completion, provided for peaceful adjustment of labour disputes, new factory standards and unemployment insurance. Progress was also made toward break-up of the *Zaibatsu*, Japan's great financial and industrial combines which played a major part in the war. Dissolution of five leading holding companies—Mitsu, Mitsubishi, Yasuda, Sumitomo and Fuji—was completed in October when their security holdings were turned over to the Holding Company Liquidation commission for sale to employees and the public. Other *Zaibatsu* assets were frozen, pending their transfer. In the field of agrarian reform, a new act approved in response to Allied directives provided for government purchase of extensive lands from noncultivator owners and their resale at controlled prices to working farmers.

Finance.—World War II left Japan with a staggering public debt, mounting inflation and a financial system requiring drastic reorganization to meet the needs of postwar reconstruction. The 1945-46 budget provided for revenue of 27,200,000,000 yen and expenditures of 103,800,000,000 yen, 16 and 45 times the corresponding figures of 1936-37. The 1946-47 budget presented to the diet in August totalled 56,000,000,000 yen, of which occupation costs amounted to 19,000,000,000. About 30,500,000,000 yen was to be raised by ordinary taxes and revenues, and 25,600,000,000 yen by a special capital levy. The national debt totalled 220,900,000,000 yen on Aug. 31, 1946. Domestic national bonds outstanding were 144,600,000,000 and bank loans 67,200,000,000 yen. In October the diet approved cancellation (by an equivalent tax) of the government's wartime obligations to individuals and corporations on account of war damage insurance, war contract cancellation, etc., thus saving 66,000,000,000 yen. The urgency of drastic financial reorganization was reflected in the 1946 spiral of inflation. On Dec. 31, 1945, the note issue of the Bank of Japan stood at 55,400,000,000 yen. As a result of a currency conversion and blocking of bank deposits in February, it dropped to 15,000,000,000 yen in new currency on March 9. However, continuing government deficits and the failure of new money to return to the banks forced an immediate resumption of the upward trend. By Dec. 17 it had reached an all-time high of 80,400,000,000 yen.

Trade and Communications.—Foreign trade was resumed on a small scale under strict Allied control in 1946. Imports were largely food, cotton and oil; exports consisted of small stocks of silk, other raw materials and a few manufactures. Rehabilitation of the textile industry began under an arrangement by which 890,000 bales of U.S. cotton were to be shipped to Japan in 1946, 60% to be re-exported in manufactured form to finance raw cotton and other necessary imports.

Japanese railways totalled 16,993.2 route mi. at the end of 1945. In Aug. 1946 train operations reached 15,500,000 train km., and freight carried was 8,200,000 metric tons. Motor vehicles numbered 107,315, of which 58% were in service. Production and operation of aircraft were forbidden to Japan under the occupation. In August there were nearly 900,000 telephones in service, and 5,168,374 paying radio-listening licences.

Agriculture.—Early estimates of 1946-47 crop yields in metric tons were as follows: rice 8,900,000; wheat 599,000; barley 404,000; naked barley 339,000; sweet potatoes 4,512,000; Irish potatoes 1,522,000; fruit 838,584; silk cocoons 30,000. The 1946 fish catch was expected to reach 2,400,000 tons, nearly double the 1945 figure. Crop acreages were as follows: rice 7,350,000 (1945); wheat 1,527,000 (1946); barley and naked barley approximately 2,100,000 (1945); Irish potatoes 520,000 (1946); mulberries 441,000 (May 1, 1946); fruit 367,000 (1945). Grazing land amounted to about 7,350,000 ac. in 1946; dairy cattle numbered 246,000. Wartime fertilizer shortages and bad weather reduced the 1945 crop of rice, which normally furnishes half the Japanese caloric intake, to only 6,445,000 metric tons, 27% less than in 1944. During 1945 Japan was also unable to secure food imports, which normally provide 15%-20% of food supplies. Difficulties in collecting food from country districts and controlling distribution in urban areas led to a food crisis in the cities in the spring and summer of 1946. The average daily food intake in Tokyo dropped to 1,352 calories in May. By comparison, the previous December average had been 2,000 calories and the urban average for Japan in 1926 roughly 2,200. City shortages were somewhat relieved by the supreme commander's release of 635,000 tons of imported staple foods, mostly from the United States, between April and September. Food prospects in 1946-47 were much improved over 1945-46, and on Nov. 1 the daily staple food ration was increased from .34 to .40 dry qt.

Manufacturing and Mining.—Industrial recovery remained at very low levels throughout 1946. The food crisis, labour troubles and deterioration in equipment combined to hold monthly coal production below 1,800,000 metric tons through August, producing an acute fuel shortage in transport and industry. August output of steel ingots and castings was only about 54,000 tons and pig iron 14,000 tons, as against average monthly production in 1943 of 675,000 and 333,000 tons, respectively. Most of Japan's light as well as heavy industries were operating well below basic requirements because of wartime destruction, lack of imported materials and fuel and financial and labour difficulties. Installed cotton spindlage in Feb. 1946, was only 2,150,000 spindles, as compared with 11,434,000 in 1940. Rayon capacity was 306,800,000 lb. Textile

production in August was as follows: cotton yarn 13,587,000 lb.; cotton cloth 17,482,000 square yards; rayon yarn and staple 24,858,000 lb. and rayon cloth 6,634,000 square yards. Real wage rates throughout industry were below prewar levels as a result of inflation and the scarcity of goods. The housing shortage was estimated at 4,500,000 dwellings. Actual unemployment far exceeded the official count of 5,600,000 in April and threatened to remain a critical problem pending the revival of industry and foreign trade. (See also FASCISM; NAVIES OF THE WORLD; REPARATIONS; UNITED STATES; WORLD WAR II.)

Jeans, Sir James Hopwood (1877-1946), British mathematician, was born on Sept. 11 in London. For his early career, see *Encyclopædia Britannica*. Sir James, renowned for his philosophic interpretation of modern science, believed that the laws of nature were not precise, like the motions of a machine, but showed "evidence of a designing or controlling power that had something in common with our individual minds." He also contended that determinism and "cause and effect" did not operate in the physical universe. A popular interpreter of difficult scientific concepts, he was one of the first to reduce the concept of atomic energy for the lay reading public. He also popularized the theory of relativity, the quantum theory, radioactivity and the transmutation of the elements. Among his later works are *Science and Music* (1937), *Introduction to the Kinetic Theory of Gases* (1940) and *Physics and Philosophy* (1942). He died at his home in Surrey, on Sept. 17.

Jet Propulsion. Turbojets.—After the end of World War II progress in the development of aircraft gas turbines for jet propulsion (turbojets) and for propeller drive (propjets) was rapid. Great Britain's royal air force and the United States army air forces were converting to all jet fighter forces, and by 1946 the naval air services of both countries had taken long steps in this direction. Jet bombers were also under development, and at least one, the Douglas XB-43, was test flown early in 1946. Except for very long range operations (5,000 mi. or more nonstop) turbojets and propjets were expected to supersede the reciprocating engine for all military aircraft, including transports, within the next five or ten years. Air Commodore Frank Whittle, who received high honours in both England and the United States for his pioneering work in jet propulsion, expressed the opinion in 1946 that within five years 10% of commercial transport aircraft would be powered by gas turbines, and that in ten years a great majority would be. On account of its efficiency and exceptional fuel economy, an attractive interim power plant is the turbine compounded piston engine, or compound engine.

Although these developments were most pronounced in Great Britain and the United States in 1946, a similar trend was evident in other countries. British jet engines were being manufactured in Canada and Australia to be fitted to their own or British aircraft. Sweden and Switzerland had ordered British jet fighters (the De Havilland Vampire), and Sweden was also building a high-speed jet fighter to take the powerful De Havilland Ghost turbojet. The U.S.S.R., with the aid of highly-skilled German technicians, was reported to have made rapid progress, bringing to fruition several developments well under way at the

close of the war in Europe, with one or two jet fighters in the 600 m.p.h. class. England had also sent 20 Rolls-Royce turbojets to the U.S.S.R. (Derwent V's and Nene I's). At the 17th International Exposition of Aeronautics held in Paris in Nov. 1946 the French exhibited their first turbojet, the Rateau GT S 65 "turbo-reacteur." This was to power a high-speed research aircraft, the S.O. 6000, with provision for a German Jumo 004; a second prototype was powered by a Rolls-Royce Derwent V, and a Nene was expected to be fitted. Another French jet-propelled research aircraft was the Arsenal VG 70-01, powered by a Jumo 004.

Aircraft gas turbines were of two main types, those with centrifugal compressor, following the original Whittle design, and those with axial compressor, following Griffith of the Royal Aircraft establishment, the German designs, Westinghouse and others in the United States. The centrifugal (or radial) flow type has a larger frontal area than the torpedo-shaped axial flow type, but is simpler, easier to develop and lighter per pound of delivered thrust.

In the turbojet field England had concentrated on the centrifugal flow type with four in production in 1946: (1) The Rolls-Royce Derwent V (normal output, 3,500 lb. static thrust), power plant of the Gloster Meteor IV. Model EE 549, one of two Star Meteors, with Derwent V's delivering 4,200 lb. thrust at 15,200 r.p.m., piloted by Group Captain E. M. Donaldson, achieved on Sept. 7, 1946, a new world's speed record of 616 m.p.h. (average of four flights). (2) The Rolls-Royce Nene (5,000 lb. static thrust), which powers the Vickers Supermarine E.10/44 jet fighter, the Gloster Ace (successor to the Meteor), the De Havilland Nene-Vampire, a new fighter design by Hawker, and the Armstrong Whitworth A.W. 52 "arrowhead" twin-jet experimental flying wing aircraft. Two Nene I's also form the outboard power plants of the Avro Nene-Lancastrian, with two Merlin piston engines as the inboard power plants. This aircraft flew from London to Paris in 50 min. on Nov. 18, 1946, 30 min. better than the normal flight time. Cruising mostly on the turbojets, the flight was not only fast but quiet and vibrationless. Taylor Turbine corporation (N.Y.) made arrangements to manufacture a U.S. version of the Nene and eventually other Rolls-Royce turbojets in the United States, and one model of the Nene I, imported as part of this project, passed the standard army-navy 150-hr. type test run at the Naval Air Matériel centre (Philadelphia) during Dec. 1946.

"THUNDERJET," rear view of the U.S. army's XP-84 fighter plane, showing the jet propulsion nozzle. Unveiled in early 1946, this plane later attained an unofficial speed of 619 m.p.h.

(3) The De Havilland Goblin II (3,500 lb. static thrust), power plant of the De Havilland Vampire and Sea Vampire. (4) The De Havilland Ghost I (5,000 lb. static thrust), which was to power the second prototype of the D. H. 108 Swallow, experimental tailless aircraft. The first prototype (Goblin-powered) was destroyed in Sept. 1946 during a test flight by Geoffrey de Havilland, who lost his life in the accident. The Rolls-Royce units, designed by Dr. Stanley Hooker, have a double-sided impeller (following Whittle), and the De Havilland units, designed by Major Frank Halford, have a single-sided impeller.

During World War II, under an agreement with the British air ministry, General Electric developed for the U.S.A.A.F. the Whittle-type I-16 (1,600 lb. static thrust) and the I-40 (4,000 lb. static thrust). The Allison-built I-40-4 (AAF, J-33-GE), develops 4,200 lb. static thrust and powers the Lockheed P-80 Shooting Star. It is also tail booster unit for Convair XP-81 and is used on the Martin XP4M.

Except for the war-developed I-16 and I-40, U.S. designers tended to favour the through-flow turbojet with multistage axial compressor, with three in production during 1946. First of these was the General Electric TG-180 (AAF, J-35-GE) which has a static thrust of 4,000 lb. During 1946 this jet engine was flight-tested in the Republic XP-84 Thunderjet, the Douglas XB-43 twin-jet bomber, and the North American XFJ-1 carrier-based fighter. At the end of 1946 additional flight tests of this unit were imminent in the North American XP-86, counterpart of the XFJ-1, but with sharply swept-back wings, the Curtiss XP-87 and the North American XB-45 jet bomber with four TG-180's in double nacelles. It also was to power several other AAF multijet bombers by Boeing, Consolidated and Martin.

Westinghouse axial-flow turbojets (developed under navy sponsorship) include the 19XB-2B Yankee (1,400 lb. static thrust), in production at Pratt and Whitney and power plant of the McDonnell FD-1 Phantom twin-jet carrier fighter. Also the 24C (2,700 lb. static thrust), which was to go into production at Wright Aeronautical corp. This unit was to be the power plant of advanced navy fighters, the Chance Vought XF6U-1, McDonnell XF2D and others. For the AAF it was to power the McDonnell XP-85 lightweight "parasite" fighter to be carried by the B-36 long-range bomber, one version of the Curtiss XP-87, the McDonnell XP-88, the Lockheed XP-90 and other experimental fighters.

Ryan's carrier-based FR-1 Fireball was composite powered for flexibility and all-altitude performance, with a Cyclone piston engine and propeller in the nose and General Electric I-16 turbojet as tail booster. Two other composite-powered aircraft for the navy were the Martin XP4M patrol bomber, with two 3,200-h.p. P. and W. Wasp Major engines and two Allison-built I-40-4 turbojets, and the Grumman XTB3F torpedo bomber, with a P. and W. 2,100-h.p. Double Wasp in the nose and a Westinghouse 19XB-2B turbojet in the tail.

British turbojets with multistage axial compressors include the Metropolitan-Vickers F.2/4 of 3,500 lb. static thrust (the F.3 with ducted fan thrust augmentor, a device highly favoured by Whittle, delivers 4,000 lb.). Two of these units power the Saunders-Roe flying boat fighter. Other more powerful units of this type were under development in England during 1946.

(Note on published ratings: For takeoff, fast climb and bursts of speed, including world record attempts in some cases, a booster mixture of water and ethyl adds from 10 to 20% thrust to all of these turbojet units.)

Turboprops.—The first turbine-propeller or turboprop to be flight-tested was the Rolls-Royce Trent (Derwent I turbojet geared for propeller). This was superseded by the intricate and much more powerful Rolls-Royce Clyde (3,000 h.p. plus 1,200 lb. static thrust), and a smaller, simpler version, the Dart, first

bench run in Aug. 1946. The Bristol Theseus was developed for long-range operation and delivers 1,950 h.p. plus 500 lb. static thrust. The Armstrong Siddeley Python was in 1946 the most powerful British propjet under flight test, with 3,670 h.p. plus 1,150 lb. static thrust. This company was also developing a smaller unit known as the Mamba (1,120 h.p. plus 320 lb. static thrust). During 1946 this unit was bench-tested, and the Python and Theseus flight-tested in Avro Lincoln heavy bombers in similar fashion to the Nene-Lancastrian.

U.S. turboprops (of which there were several under development during 1946) include the General Electric axial-flow TG-100 (AAF, T-31) which had a rated power of 2,200 h.p. plus 600 lb. static thrust. This unit was flight-tested late in 1945 in the Consolidated Vultee XP-81 long-range tandem jet fighter, with the J-33-GE turbojet as tail booster. The Ryan XF2R carrier-based fighter, powered by the TG-100 turboprop and I-16 turbojet in the tail, was announced by the navy in late 1946. The TG-100 was also scheduled to power the Martin 304 medium-weight high-speed transport which was to be built for United Air Lines.

Another axial-flow turboprop, the Northrop-Hendy Turbodyne (in the same power bracket as the TG-100) was announced in the autumn of 1946. Wright Aeronautical's more powerful turboprop, the Menasco L-4000 turbojet (developed from the original Lockheed L-1000) and the Packard turbojet (based on the De Havilland H-1, or Goblin) had also been bench-tested but had not been test-flown at the end of 1946. Powerful turboprops by Allison and Pratt and Whitney were also under development at the close of the year.

Ramjets and Resojets.—Two other types of jet propulsion underwent considerable development during 1946. The ramjet (or athodyd, from Aero THERMO DYnamic Duct) is a suitably shaped duct equipped with fuel burners. Instead of using a compressor (as in the gas turbine) it relies on ram compression and must be launched by auxiliary means (such as a rocket) to give it initial forward speed to provide ram pressure. There are no moving parts. As a part of its comprehensive Project Bumblebee the U.S. navy developed a five-inch ramjet ("flying stovepipe") called the Cobra. Air Matériel command (Wright field) and the National Advisory Committee for Aeronautics' Propulsion laboratory (Cleveland) had larger ramjets (up to 20-in. diameter) under development at the end of 1946. All were capable of speeds of 1,500 m.p.h. and over. Allison, General Electric, Curtiss-Wright and Ryan Aeronautical were among the companies actively engaged in the development of ramjets. A modified Mustang (P-51) fighter with ramjet assist had been test-flown. The British had similar developments, including a very high-speed prone-pilot fighter with thick wings powered by an athodyd, and the Germans had several experimental models well under way by the end of the war in Europe, in May 1945.

The intermittent duct or resonant jet engine (resojet or pulsejet), like the ramjet, required no compressor. Equipped with light flap-type check valves, the successive explosions propelled the exhaust gases to the rear, producing continuous thrust without ram. This type of engine powered the German V-1 buzzbomb, and was used in several experimental guided missiles developed by the AAF and the navy, built by Northrop, McDonnell, Republic and others. The biggest problem with ramjets and resojets was the very high fuel consumption. Intensive development work on these types, which might eventually supersede the turbojet, was going forward, as was also work on rocket engines. Initial use would be for guided missiles and pilotless aircraft, but ultimately some application to piloted military and commercial aircraft was regarded as almost certain. (See also AVIATION, MILITARY; MUNITIONS OF WAR.)

(N. F. S.)

Jewish Religious Life.

The year 1946 showed some surprising contrasts. Thus, from England where religious liberty is a strongly entrenched tradition, came reports that Anglo-Jewry was rapidly drifting toward extinction because of the tremendous progress of indifference. On the other hand, from the U.S.S.R. where previously there had been the most concentrated antireligious propaganda and atheistic indoctrination, there was the reconstitution of the Jewish religious community in such towns as Moscow and Rostov. Similarly, in Juan Perón's Argentina, a Yeshiva was opened for the training of rabbis and Jewish religious teachers.

The main Jewish religious activity in continental Europe was the attempted reconstruction of what remained of Jewish life. This was difficult because few rabbis had survived, and many of the remaining laity were spared because they were only half-Jews. Thus, in Mannheim, Germany, of the 20 remaining out of the pre-Hitler community of 4,000, half the "Jews" were baptized or were children of mixed marriages. Only one rabbi was left in all Germany; in the Netherlands only three, and in Czechoslovakia of 150 only 15 were alive, of whom seven were really active. Many ruined synagogues were rebuilt, usually through the generosity of United States Jewry organized in the Joint Distribution committee. Tens of thousands of religious articles, prayer books and educational supplies were sent by that committee from the U.S. to war ravaged countries, and large sums were given as subventions for rehabilitating European Jewish religious institutions. United States Jewish chaplains and other religious representatives also played a notable part in caring for the religious needs of Jewish displaced persons. The Vaad Hatzala (Rescue committee) organized by U.S. orthodox rabbis, also provided religious supplies and found homes for many war orphaned children, supported religious schools and subventioned European rabbis stranded in Siberia and the far east. But despite all this generous help, Jewish religious life in the lands where the German armies went was generally very far from normal functioning even on a reduced scale.

In the United States, the greatest centre of free Jewish life, considerable religious vigour could be recorded, such as in the field of religious education. The military draft brought about a shortage of religious school teachers. But nevertheless, there was a slight increase in Sunday school enrolment, greater activity in the more intensive schools meeting two, three, four or five times a week, as well as a very marked growth in the number of Jewish parochial schools. The Jewish community as a whole remained opposed to the public schools giving release time for religious education, regarding this as an unsatisfactory substitute for a more serious and better-organized system of religious education, and as in conflict with the U.S. principle of the separation of church and state in the public school system. During 1946, New York state gave recognition to the Rabbi Isaac Elchanan Theological seminary and Yeshiva college as a university, and the Jewish Theological seminary announced far-reaching plans for expansion of its work.

In the face of resurgence of anti-Semitic organizations, there were many enheartening instances of interfaith goodwill. The first international conference of Christians and Jews was held at Oxford, England.

The most notable of the religious leaders claimed by death during the year was Dr. Joseph H. Hertz, chief rabbi of the British empire. (See also ANTI-SEMITISM.)

(D. DE S. P.)

Jewish Welfare Board, National.

The National Jewish Welfare board (J.W.B.), organized in 1917 as an instrumentality for

religious, welfare and morale service to Jewish men and women in the U.S. armed forces, was awarded a joint citation in 1946 by the U.S. war and navy departments for its "unique and outstanding service" to U.S. servicemen and women stationed throughout the world during World War II. The award was made in May at the 29th annual conference of J.W.B., the first yearly meeting to be held by the organization after the beginning of World War II.

A member agency of U.S.O., J.W.B. operated 80 U.S.O.-J.W.B. installations in 1946. In the United States, 626 local army and navy committees served thousands of men and women in the armed forces, and 58 such committees in Germany, Austria, France and China provided services to the J.W.B. hospitality centres maintained for servicemen in the armies of occupation.

The third and final issue of *Fighting for America*, a book which tells the story of Jewish participation in World War II, was prepared by J.W.B. in 1946 for publication early in 1947.

Thirty-eight national Jewish organizations were affiliated with J.W.B. in 1946, and, in addition, J.W.B. was the national association of 288 Jewish community centres and Y.M.H.A.'s and Y.W.H.A.'s in the United States and Canada, with a total membership of 437,000 adults and young people. In 1946, J.W.B. provided these Jewish communities with 950 bookings of lecturers, artists and musicians. In order to guide the organization's peacetime program of expanded service to the U.S. Jewish community, J.W.B. caused an independent survey of its own program and activities to be conducted.

In 1946, J.W.B. joined with representatives of Australia, Canada, France and England in creating the World Federation of Y.M.H.A.'s and Jewish community centres.

Officers in 1946 were: Frank L. Weil, president; Mrs. Felix M. Warburg, honorary vice-president; Mrs. Alfred R. Bachrach, Lloyd W. Dinkelspiel, Irving Edison, Mrs. Samuel R. Glogower, Mrs. Walter E. Heller, Carl M. Loeb, Jr., Donald Oberdorfer, Walter Rothschild, vice-presidents; Joseph H. Cohen, treasurer; Robert K. Raisler, assistant-treasurer; Joseph Rosenzweig, secretary; Ralph K. Guinzburg, assistant secretary; Louis Kraft, executive director. Offices in 1946 were at 145 East 32nd street, New York city.
(F. L. W.)

Jinnah, Mahomed Ali (1876-), Indian statesman and politician was born on Dec. 25 in Karachi. He studied law in England, and in 1906 he became an advocate of the Bombay high court. In 1910, Bombay Moslems elected him to the imperial legislative council. He joined the Moslem league in 1913 and was instrumental in getting Hindus and Moslems to hold joint sessions at the Lucknow conference in 1916.

Jinnah's zealous advocacy of an independent India cooled considerably in the aftermath of World War I. His disagreement with Mohandas Gandhi over methods of obtaining the desired independence grew sharper, and he no longer was the leading Moslem proponent of concord with the Hindus. At the London round table parleys (1930-31), Jinnah, although not a delegate, demanded separate electorates for Hindus and Moslem communities as well as equality for Moslems in the sharing of offices in the central and provisional governments. In the succeeding years, "Pakistan" (a wholly independent Moslem state) became the keystone of Jinnah's political philosophy, and the Moslem views were officially recognized by the British government during the negotiations conducted in India by the Cripps mission in 1942. At the unsuccessful London parleys on India in Dec. 1946 Jinnah reiterated that only the division of the country into separate Hindu and Moslem states could provide a satisfactory solution of the Indian problem.

Jodl, Alfred (1892?-1946), German army officer, served in the Bavarian army during World War I. After the Armistice he was attached to the ministry of war staff and later with the German intelligence service. Rising in the wehrmacht to the rank of major general in 1939, Jodl became eventually the fuhrer's personal commander in chief. He was liaison man between the wehrmacht and Hitler's cabinet, one of the chief designers of Hitler's war strategy and was said to have been closer to Hitler than any other high officer. He took an active part in the campaigns against the U.S.S.R., Yugoslavia and Greece and devised the strategy following the wehrmacht's setback at Moscow. In Oct. 1942 he was made Hitler's chief military adviser. He was promoted to colonel general in Jan. 1944, and was wounded during the attempted assassination of Hitler the following June. Jodl, who was made chief of the joint staff in early 1945, headed the German delegation that signed the Allied surrender terms in Reims, France, May 7, 1945. He was later arrested and held for trial as a war criminal. During the sessions at Nuernberg Jodl asserted that the British and French declaration of war in Sept. 1939 came as a surprise to the nazi leaders and that Germany was unprepared to fight a large-scale war when it attacked Poland. He also disclosed that Hitler had delayed the attack on the western front 17 times because of bad weather and because he had been unnerved by Allied inaction. At the trial the prosecution produced evidence that Jodl signed an order to execute commandos and prisoners of war. On Oct. 1, 1946, the court found him guilty and sentenced him to death for crimes against the peace, war crimes, crimes against humanity and for conspiracy to commit these crimes. He was hanged in Nuernberg, Oct. 16.

Johns Hopkins University.

An institution of higher learning in Baltimore, Md. President, Isaiah Bowman. It consists of: three undergraduate schools—the college of arts and sciences, the school of engineering, and the school of business; the graduate school, the faculty of philosophy; the night school of technology; the college for teachers; the school of medicine; the school of hygiene and public health; and the Johns Hopkins applied physics laboratory at Silver Spring, Md. Of the undergraduates in 1946 60% were war veterans. To meet demands of increased enrolment, Hopkins added 24 full professors, 41 associate professors and a great number of assistant professors and instructors. The university ranked among the seven top U.S. universities handling war scientific research contracts. It took the lead in postwar fundamental research, co-ordinated with government and industry through its newly established Institute for Co-operative Research. During 1946, the university established four new departments: aeronautics, classics, sanitary engineering and an unique department of writing, speech and drama. Recommendations of the report of the Postwar Planning Committee on Curriculum were implemented during 1946. The university sponsored a series of student forums on the local radio station. Extracurricular activities curtailed or abandoned during World War II resumed full-scale operation by 1946. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (I. Bo.)

Johnson, Herschel V.

(1894–), U.S. government official and diplomatist, was born May 3 in Atlanta, Ga. He graduated from the University of North Carolina in 1916, and served overseas with the A.E.F. during World War I, attaining the rank of a captain. After the war, he entered Harvard Law school and subsequently won an appointment to the U.S. foreign service. In 1921 he was named legation secretary to Switzerland and in the succeeding years he

held similar posts in embassies or legations in other countries. In 1941 President Roosevelt appointed him minister to Sweden. In the closing days of World War II, Count Folke Bernadotte passed on to Johnson and Sir Victor Mallet, the British envoy, Heinrich Himmler's peace proposals offering unconditional surrender to all the United Nations except the soviet union. Himmler's offer was promptly rejected by the Allies. In April 1946 Johnson was recalled from Stockholm to become deputy to Edward R. Stettinius, Jr., then chief U.S. delegate on the United Nations Security council. After Stettinius' resignation (June 3), Johnson was appointed interim delegate. Johnson rejected the Ukrainian charge against Greece and proposed (Sept. 18) that a subcommittee investigate the incidents along Greece's frontiers with Yugoslavia, Bulgaria and Albania.

Johnson, Walter

(1887-1946), U.S. athlete, was born Nov. 6 in Humboldt, Kan. After pitching sandlot baseball in Weiser, Ind., he joined the Washington Senators baseball team in 1907. Having great speed and control, he soon became the top pitcher of the Senators and stayed with that team for 21 years. During that time, he won 414 victories against 297 defeats. His best year was in 1913 when he won 36 games and lost only 7. He also set a record of 3,497 strikeouts during his 21-year span in baseball.

Johnson left the playing field in 1927 and was manager of the Senators, 1929-32, and of the Cleveland Indians, 1933-35. He entered politics in 1938, with a successful campaign for county commissioner. Johnson was elected to baseball's Hall of Fame at Cooperstown, N.Y., in 1939. In 1940, he lost a close race for U.S. representative. He died of a brain tumour in Washington, D.C., Dec. 10.

Johnston Island: see PACIFIC ISLANDS, U.S.

Jones, George Clarence

(1895-1946), Canadian naval officer, was born on Oct. 24 in Halifax, N.S. Shortly after completing his training at the old Canadian naval college, he was assigned to active sea duty, and during World War I he was engaged in mine-laying operations in the North sea. He later returned to Canada for duty as executive officer of the naval college and subsequently held other executive posts. His attendance at the Royal Naval Staff college and the Imperial Defense college was followed by tours of duty aboard British battleships. At the beginning of World War II he was captain of destroyers and escorted a number of wartime convoys moving out of Canada's eastern ports. He served as commanding officer of the Atlantic coast, 1940-42 (during which time he was promoted to rear admiral), vice chief of the naval staff, 1942-43, and succeeded Adm. Percy W. Nelles as chief of the naval staff in Jan. 1944. Rear Adm. Jones died in Ottawa on Feb. 8.

Jute.

All of the jute for bagging and other uses in the United States is imported, practically all from India. Imports in 1946 were expected to be about 150,000,000 lb. compared with 143,013,000 lb. imported in 1945 and an average of about 160,000,000 lb. in 1934-38. Most of the jute is used for open-weave cotton boll bagging. Other large uses are for rugs, carpets,

twine, bags for farm products and supplies. A cotton crop of 12,000,000 bales requires about 150,000,000 lb. of jute. Substitutes for jute bags were tested during World War II without much success. Paper and cotton were the principal materials used. (J. C. Ms.)

Juvenile Delinquency. In the 199 courts reporting to the federal children's bureau, division of statistical research there was an increase of 4% from 104,193 in 1944, to 108,662 in 1945. These represent various sections of the U.S. in 30 states, including the District of Columbia. There were important variations among the individual courts. South Carolina showed a decrease of 21%, Rhode Island an increase of 87%. However, Rhode Island in July 1944 raised the age from 16 to 18 years under which the juvenile court has jurisdiction over delinquent children. Utah showed an increase of 40%, whereas the 42 courts of New York state had a decrease of 9%. But the 65 courts dealing with large city areas and the 134 courts serving areas with less than 100,000 population, each taken as a whole, showed increases of 4%.

There was important variation between court cases of boys and girls. Boys' cases, which represent more than four-fifths of the total number of juvenile court cases, increased 7%. For all courts combined there was a decrease in girls' cases amounting to 5%.

Interpretation of these statistics in comparison with the year 1938 shows a consistent upward trend after 1939, reaching its highest point in 1945. Increases of city population with movement from rural areas was undoubtedly a factor. The development of services to children for the relief of tensions of wartime economic and social conditions hardly kept pace with need. Children were particularly vulnerable to social changes resulting in emotional stress to adults.

Significant programs of treatment and prevention were being attempted in some communities. The Youth authority of California, the establishment of juvenile divisions in police departments in many communities, showed awareness of the magnitude of the problem.

(See CHILD WELFARE; CRIME; FEDERAL BUREAU OF INVESTIGATION.) (M. V. W.)

Kalinin, Mikhail Ivanovich (1875-1946), soviet statesman, who became president of the U.S.S.R., was born of peasant parents on Nov. 20 in Verkhnyaya Troitsa, Tver (Kalinin) province. An active revolutionary from his early youth, he was frequently arrested for his overt opposition to tsarist rule. In 1911, he went to St. Petersburg (now Leningrad) to join the staff of the clandestine bolshevik publication, *Pravda*, and there worked closely with Nicolai Lenin and Joseph Stalin. After the outbreak of the Russian Revolution in 1917, Kalinin was elected to the central committee of the Communist party and in March 1919, on Lenin's recommendation, he was elected chairman, or president, of the all-Russian Central Executive committee—then the supreme governing body of Russia. In 1922 with the formation of the Union of Soviet Socialist Republics, he became chairman of the central executive committee of the U.S.S.R. Following the adoption of the Stalin constitution in 1936, he was elected president of the presidium of the supreme soviet. He was also a member of the Communist party's politburo (political bureau).

Although officially Kalinin held the post of chief of state for 27 years, actually he wielded little power. He retired in April 1946 as president of the presidium because of ill health, and died on June 3, according to a Moscow radio announcement. See *Encyclopædia Britannica*.

Kaltenbrunner, Ernst (1901-1946), Austrian politician, attended public schools at Linz and studied at the University of Prague. He joined the Austrian nazi party in 1932 and was leader of the S.S. (elite guards) in Austria in 1935. After the *Anschluss* he became the official head of the Austrian storm troopers. He was also appointed secretary of state for security in Austria, holding this post until 1941. He was made chief of the security police, Jan. 30, 1943, and following the assassination of Reinhard Heydrich by Czechoslovak patriots in June 1943, he became head of the Reich Security Head office. He was taken prisoner by U.S. troops on May 15, 1945, and was indicted on charges of war crimes by the international military tribunal at Nuernberg, Aug. 29, 1945.

At the trial, the prosecution introduced documents and witnesses who testified that Kaltenbrunner's rule was as bad if not worse than that of his predecessor. He was said to have agreed with Heinrich Himmler at a conference in 1942 upon the gas chamber form of execution to permit the slaughter of Jews.

In his defense, he claimed that the criminal program of the gestapo had been started before he took office and he also declared that he had had an understanding with Himmler before he became chief of the R.S.H.O. that he was to confine his activities to foreign intelligence only. He was convicted Oct. 1, 1946, of committing war crimes and crimes against humanity and was sentenced to death. He was hanged Oct. 16.

Kamerouns: see BRITISH WEST AFRICA; FRENCH COLONIAL EMPIRE.

Kansas. A central state of the United States, admitted Jan. 29, 1861; popularly known as the "Sunflower state." Total area, 82,276 sq.mi., of which 82,113 sq.mi. are land; pop. (1940) 1,801,028 (a decrease of 79,971 or 4.3% from 1930). Capital, Topeka (67,833). The two larger cities in 1940 were Kansas City (121,458) and Wichita (114,966). Of the state's population in 1940, 753,941 were urban, or 41.9%; 96.3% were white, 3.7% Negro and other races, 2.9% foreign born. The Kansas census as of March 1, 1946, reported the total population as 1,784,453, a loss of 8,613 from 1945. Wichita, with a 1946 population of 153,411, was the largest city; Kansas City was the second with 137,065, and Topeka third with 79,154. Wichita lost 22,905 from the war-industry employment peak of 1944, while Kansas City and Topeka made gains during 1945 of 3,853 and 2,564 respectively.

FRANK CARLSON, Republican, was elected governor of Kansas on Nov. 5, 1946

History.—The state election in 1946 resulted in a Republican landslide: Frank Carlson, governor; F. L. Hagaman, lieutenant governor; F. J. Ryan, secretary of state; George Robb, auditor; R. T. Fadely, treasurer; E. F. Arn, attorney general; L. W. Brooks, superintendent of public instruction. Only Ryan, Robb and Brooks had formerly held the same office. Only 18 Democrats were elected to the lower house of 125 members, and there was one Democrat in the senate, elected in 1944, who

was held over. The principal interest in the campaign centred in the contest for the governorship, in which Harry H. Woodring, former governor and former secretary of war in the F. D. Roosevelt administration, was the Democratic opponent of Carlson. The official figures gave Carlson 309,036 votes and Woodring 254,283. The principal issues centred around the Republican record on liquor, social security and school reorganization.

Education.—Enrolment in the elementary and secondary schools for 1944-45 was 323,974; and of this number 88,602 were enrolled in high schools and 235,372 in elementary schools. There were 4,981 one-teacher schools, with an enrolment of 53,979 pupils. Preliminary figures for the school year 1945-46 showed a reduction of one-teacher schools to 3,769, with the school-reorganization program authorized by the legislature of 1945 only partly executed. Emergency teachers' certificates issued for the calendar year 1945 numbered 8,157, and for the year 1946 the number was reduced by about 1,600, mostly through elimination of one-teacher schools.

Social Insurance and Assistance, Public Welfare and Related Programs.—The 1945 populations of the state's penal and charitable institutions was as follows: industrial school for boys, about 100; industrial school for girls, average 149; industrial reformatory, about 330 (peak, 1929, was 1,098); penitentiary, average 972 (peak 1936, 1,982); industrial farm for women, about 50 (peak 1927, 201).

A receiving home for the study of delinquent and maladjusted children was opened in 1944. Three state hospitals for the insane had a total of 5,060 inmates in 1945; a training school for mental deficient averaged 2,278 and a hospital for epileptics 757, while the state orphans home cared for from 109 to 130 children during the year.

Communication.—In 1944, the state had 9,373 mi. of rural highways under state control; the steam railroad mileage was 8,448; the number of airports was 127, 38 of which were commercial and 45 municipal.

Banking and Finance.—As of Dec. 30, 1944, there were 619 active banks, 176 of which were national, with demand deposits of \$1,163,100,000. Savings and time deposits of all banks amounted to \$116,100,000.

A state budget of \$34,627,290 was prepared for submission to the 1947 legislature for the biennium 1947-49, about \$11,500,000 more than was appropriated for the biennium 1945-47. This did not include the building program. Charitable institutions were to receive \$7,476,568, compared with \$5,422,344 appropriated for 1945-47; penal institutions \$2,426,592, compared with \$2,169,876; educational institutions \$15,731,314, compared with \$9,848,043. Tax collections for the fiscal year July 1, 1945-June 30, 1946, amounted to the unprecedented figures of \$45,500,948, and for the last six months of 1946, \$26,410,446. The opinion was expressed that the budget estimates recommended could be met out of regular revenues and accumulated surpluses, without tax increases.

Agriculture.—The 1946 production of Kansas crops was 1% more than 1945, but 14% less than 1944. The farm value was estimated at \$618,292,000, the highest on record, and 7% higher than the previous record of 1919. Wheat production was second only to 1931, the average yield being 16.2 bu. per ac. compared with the 10-year average of 13.5 bu. It was the sixth successive

good crop for the southwestern winter wheat belt, a record without equal. Corn production was 63,231,000 bu. compared with the 10-year average of 55,247,000 bu.

Fall planting of winter wheat for the 1947 crop was estimated at 14,994,000 ac., or 6% increase over the acreage sown for the 1946 crop. Wheat condition Dec. 1, 1946, was 94% compared with 78% at the same time in 1945. The spring movement of cattle from the southwest into the Bluestem pastures in 1946 was the largest in several years, 9% larger than in 1945 and 22% larger than in 1944—340,000 cattle and calves, compared with 312,000 in 1945, and a ten-year average of 224,000.

Manufactures and Mineral Production.—The value of manufactured products for 1939, the last prewar enumeration, was \$464,354,000, compared with \$543,807,000 in 1937. The war years brought many new industries and expanded others, and the postwar reconversion period brought an active campaign to locate new small industries in Kansas.

The mineral production of Kansas was valued at \$219,678,000 in 1944, compared with \$220,413,000 for 1943. The state ranked ninth as a mineral producing state; fifth in the production of petroleum, natural gas and zinc mining; third in salt and first in volcanic ash.

(J. C. MN.)

Keenan, Joseph Berry (1888—), U.S. government official was born Jan. 11, in Pawtucket, R.I. He received his B.A. and M.A. degrees from Brown university, Providence, R.I., and his LL.B. from Harvard Law school. He saw service on the Mexican border in 1916, and the following year went overseas as a first lieutenant and was assigned to the judge advocate general's office. After World War I, as assistant to the Ohio attorney general, he established a reputation as a successful prosecutor of gangsters and criminals. He was called to Washington in 1933 to become special assistant to Attorney General Homer S. Cummings, then spurring a federal campaign to curb kidnapping and racketeering. In 1939 he resumed private practice but was recalled by President Truman in Sept. 1945 to become chief prosecutor for the International Military tribunal in the far east that was to try Japanese leaders on charges of war crimes. He arrived in Tokyo Dec. 6, 1945, and four months later (April 29, 1946) returned indictments against 28 Japanese leaders on 55 counts, which included charges of crimes against peace, "conventional war crimes" and crimes against humanity. The trial started June 4. In his opening statement, Keenan asserted that his prosecution would be no "ordinary trial" but would be part of the battle to "preserve the world from destruction." Later, he returned to Washington where he disclosed (June 17) that a decision had been made on a "high political level" not to try the emperor as a war criminal.

Keitel, Wilhelm (1882-1946), German army officer, was born Sept. 22 at Gandersheim near Brunswick. He entered the army in 1901 and continued in the reich war ministry after World War I. Known as a political general, Keitel ranked high in Hitler's estimation and in Feb. 1938, Keitel succeeded Werner von Blomberg as chief of staff. He thus directed all major operations (under Hitler's guidance) from the Polish victory in 1939 to the final German defeat in 1945. Keitel, who headed the German delegation that signed the unconditional surrender terms in Berlin, May 8, 1945, was later arrested and held for trial as a war criminal.

At the Nuernberg sessions the prosecution produced documentary evidence showing that Keitel had approved nazi plans for seizure of Czechoslovakia, Poland, Norway, the Netherlands, Belgium and France. Although he protested against the invasion of the U.S.S.R. on strategical grounds, he finally

Leading Agricultural Products of Kansas, 1946 and 1945

Crop	1946	1945
Wheat, bu.	216,768,000	207,939,000
Corn, bu.	63,231,000	68,563,000

Oats, bu.	40,556,000	16,940,000
Barley, bu.	5,022,000	7,086,000
Soybeans, bu.	2,178,000	2,350,000
Potatoes, bu.	1,632,000	1,394,000
Hay, tons	2,328,000	2,851,000
Sorghum (forage), tons	2,083,000	2,273,000

endorsed the attack.

It was also proven that Keitel ordered the army to carry out Hermann Goering's economic directives for "exploitation" of soviet territory, food and raw materials. He justified illegal treatment of soviet prisoners on the ground that "this is the destruction of an ideology. Therefore I approve . . ." He likewise endorsed Alfred Rosenberg's looting of cultural property of German-occupied countries and of the reduction of Poland to a slave nation. To field commanders in the soviet union he gave orders for terrorizing the civilian population, stating that legal punishment was inadequate. Keitel's defense, that as a soldier he only carried out orders issued by his superiors, was prohibited under the court's charter. He was found guilty Oct. 1, 1946, and sentenced to hang for crimes against the peace, war crimes, crimes against humanity and of conspiracy to commit those crimes. The sentence was carried out Oct. 16.

Kentucky. An east south central state of the United States, admitted to the union June 1, 1792, popularly known as the "Blue Grass state." Area 40,395 sq.mi., of which 286 sq.mi. constitute water (chiefly the Ohio river). Population as of July 1, 1940, was 2,845,627 of which 2,443,252 were whites. Negroes constituted 209,721 or 7.5% and 15,631 were foreign-born. Capital, Frankfort (11,492); largest city, Louisville (319,077). Other cities: Covington (62,018); Lexington (49,304); Paducah (33,765); Owensboro (30,245); Ashland (29,537). Population (estimated July 1, 1945) was 2,578,179—a loss of 11% from 1940.

History.—Chief officers (elected in 1943 for a term of four years) were Simeon S. Willis, governor; Eldon S. Dummitt, attorney general; Irvin Ross, auditor; T. W. Vinson, treasurer; John Fred Williams, superintendent of schools; Elliott Robertson, commissioner of agriculture. In the election of Nov. 5, 1946, John Sherman Cooper (Rep.) was elected U.S. senator for two years over John Y. Brown (Dem.) by 41,823 votes. The Republicans also elected congressmen in the 3rd, 7th and 9th districts. The general assembly of 1946 passed 248 acts. It adopted a budget of \$87,875,000 for the biennium, a motor responsibility act for all accidents if damages exceed \$50, and made it a felony to carry concealed weapons. It declared Franklin D. Roosevelt's birthday a state holiday (Jan. 30).

Education.—Elementary schools in 1946 numbered 5,898 with 12,519 teachers and 405,862 pupils. In 670 high schools were 5,118 teachers and 123,229 pupils.

Social Insurance and Assistance, Public Welfare and Related Programs.—In 1945-46 the unemployment board paid \$6,670,000 to 30,200 civilians. Old-age assistance was given to 52,268; dependent children numbered 6,631; needy blind, 1,591. The number of inmates in correctional institutions was as follows: reformatory, 1,497; penitentiary, 860; women's prison, 41; reform school for boys, 250; for girls, 45. The children's home reported 267. The assembly authorized five new sanatoriums for tubercular patients, and received back from the U.S. the Darnall hospital (renamed State hospital) Feb. 10, 1946, which took 437 mental patients from other hospitals. By the end of 1946, 92 counties had voted dry.

Communications.—The highway department maintained 10,153 mi. of hard roads during 1946. Total receipts were \$19,967,000 while expenses were \$17,554,000. In August the Livermore bridge was freed of tolls, and the Clay's Ferry bridge (1,736 ft. long, 250 ft. above the Kentucky river) was completed. Railway mileage declined to 3,705 mi.

Banking and Finance.—On June 30, 1946, there were 93 national banks with resources of \$627,881,000; 297 state banks and trust companies with resources of \$941,787,000; and 72 building and loan associations with assets of \$47,471,000. From

its general fund the state drew \$17,793,000 for education; \$7,374,000 for welfare work; and \$6,006,000 for general government. Receipts in the same period were: property and inheritances, \$9,725,000; income taxes, \$9,385,000; excise taxes, \$26,422,000; from alcohol taxes and licences, \$11,286,000; from other licences, \$6,842,000; total: \$64,341,000. In addition to these sums the Southern Pacific railroad paid current and delinquent taxes of \$4,104,000. The surplus rose to about \$30,000,000. There was no debt.

Agriculture.—The leading crops of 1946 appear as reported in the table.

Leading Agricultural Products of Kentucky, 1946 and 1945

Crop	1946	1945
Wheat, bu.	4,976,000	5,278,000
Corn, bu.	94,278,000	77,824,000
Oats, bu.	2,200,000	1,925,000
Tobacco, all types, lb.	488,790,000	469,395,000
Hay, tons,	3,010,000	2,525,000
Irish potatoes, bu.	4,752,000	3,999,000

Mineral Production.—During the year 1945 Kentucky produced 70,236,031 tons of coal, employing 52,891 miners, who suffered 126 fatalities. Petroleum yielded 10,332,301 bbls. Natural gas was estimated at 90,000,000,000 cu.ft. (E. T.)

Kenya: see BRITISH EAST AFRICA.

Keynes, John Maynard, 1ST BARON OF TILTON (1883-1946), British economist, was born on June 5 at Cambridge. For his early career, see *Encyclopædia Britannica*. A representative of the British treasury and exchequer at the Paris peace conference, Jan.-June 1919, he resigned his mission because he disagreed with several phases of Allied policy, asserting that the reparations clauses were too severe and that other measures of the Versailles treaty were also unwise. His principal argument, that the Versailles treaty would harm the Allies more than it would the defeated reich, was substantially borne out. Keynes derided the phrase "balancing the budget" as a shibboleth of little value and said in 1932 that there was no possibility of balancing a national budget "except by increasing the national income, which is the same thing as increasing employment." In the spring of 1940 he returned to the British government as a member of the chancellor of the exchequer's advisory council. He was elevated in 1942 to the peerage as 1st baron of Tilton. He participated in the first meeting, July 1, 1944, of the United Nations monetary and financial conference at Bretton Woods, N.H., where agreements were drafted for the establishment of an International Stabilization fund and an International Bank for Reconstruction and Development. He was later elected a vice-president of the world bank and fund. Keynes signed (Dec. 6, 1945) for his country the U.S.-British loan agreement under which Britain was to get a total of \$4,400,000,000 in credits from the U.S.—provided the measure was passed by congress. He returned to Britain for a rest in early April 1946, and died at his home in Firle, Sussex, on April 21.

Keyserling, Hermann, COUNT (1880-1946). German philosopher, was born on July 20 in Koenno, Livonia, of a noble family. See *Encyclopædia Britannica* for his early career. His principal work is *Das Reisetagebuch eines Philosophen* (1919), an English edition of which was published in 1925 under the title, *The Travel Diary of a Philosopher*. After the National-Socialists came to power, Count Keyserling was deprived of his German citizenship in 1934; this was later restored, allegedly because the nazis then were sensitive to adverse comment in other countries over their actions. During World War II the nazi party censured the count as "unworthy to represent the German spirit." Finally, in 1942,

he took refuge in Innsbruck, Austria, hoping to escape further attention from nazi officialdom. While living in the Tyrol he completed two more books, *The Book of Origin* and *Trip Through Time*. He died in Innsbruck on April 26.

Kidnapping. The end of World War II brought an upturn in the number of kidnappings, along with similar increases in other types of crime. Most widely publicized kidnapping of the year occurred in Jan. 1946, when Suzanne Degnan, six years old, was taken from her parents' home in Chicago. Discovery of her dismembered body started an intensive search for the slayer, but the more obvious clues produced no results. Five months later, when police activity on the case had subsided, William Heirens, a student at the University of Chicago, was arrested for burglary. His fingerprints were discovered to be similar to those found on a ransom note, and after many reports of confessions, Heirens was convicted not only of the Degnan crime, but of two other murders, and received three consecutive life sentences. His attempt at suicide was frustrated.

China was also featured as the locale of kidnappings. In April the Shanghai magnate Ying Teh-sheng was kidnapped, reportedly by three men. In August eight Chinese were executed for the crime. Political overtones featured a charge by communists that Chinese secret police had kidnapped Sun Chung-yuan in July, while the same month found United States military forces in Hsinanchwang seeking seven United States marines who reportedly had been kidnapped by unidentified Chinese. One month later 40 armed bandits attacked and looted a village near Wusih, and carried off 13 of its inhabitants.

Midsummer of 1946 also saw an outbreak of kidnapping in Italy, where several industrialists were seized by strikers as labour and social disorders became widespread. Also returning to criminal dockets were the ransom kidnappings long associated with the activities of the Mafia prior to its suppression in Sicily by Mussolini's police state.

Kidnappings on an unprecedented scale were charged to German nazis through mass seizures of children of various nationalities. In this connection the United Nations Relief and Rehabilitation administration conducted numerous investigations which were alleged to establish the existence of a systematic nazi kidnap policy affecting children in occupied countries.

Political influences were also at work in the Polish charge that the United States army had been instrumental in abducting 1,200 boys from a camp for "displaced persons" and in shipping them to Italy as part of Lieut. Gen. Wladyslaw Anders' political movement.

When Major J. S. Donald of the British army in India was kidnapped and held for ransom in September, the sum demanded was paid, but the kidnap victim was shot to death after his release. Thereupon British planes bombed villages along the Northwest Frontier in order to enforce recovery of the ransom. Tribesmen responsible for the kidnapping were reported to have agreed to return the ransom and to pay damages for the death of Major Donald.

During the 12-months' period ending June 30, 1945, there were 18 kidnappings in the United States. None of these were featured by demands for ransom and all were solved. From the time the FBI acquired jurisdiction on June 22, 1932, it had investigated 279 kidnapping cases. All but two of them had been solved. (See also FEDERAL BUREAU OF INVESTIGATION.)

(BR. S.)

King, William Lyon Mackenzie (1874-), Canadian politician, was born at Berlin (now Kitchener), Ont., Dec. 17. For a biographical account, see *Encyclopædia Britannica*. Following Canada's en-

try into World War II, the country stood behind Prime Minister King.

He co-operated with the United States in measures for common defense of the two countries, and he participated in several Churchill-Roosevelt conferences. In the general elections held June 11, 1945, King's liberal party emerged victorious although it failed by a slim margin to obtain a clear majority. King himself was defeated in his constituency in Prince Albert, Sask., but was re-elected in a parliamentary by-election in Ontario, Aug. 6. He participated with Truman and Attlee in the Washington conference on atomic energy, Nov. 15.

An espionage case was disclosed Feb. 15, 1946, by the prime minister, who asserted that 22 men were seized by Canadian police for questioning concerning their alleged disclosure of secret information to unauthorized persons including members of a foreign mission. On Feb. 20, the soviet government admitted that the soviet military attache obtained data in Canada, but said the "insignificant" information secured already had been published. In a report made March 18, King told the Canadian house of commons that the government had documents proving that Canada "was being used as a base to obtain information of matters of very great importance to the U.S. and Great Britain."

Kleffens, Eelco Nicolaas Van (1894-), Netherlands statesman, was born Nov. 17 in Heerenveen, the Netherlands. He was graduated with an LL.D. degree from Leyden university in 1918 and was a member of the League of Nations secretariat, 1919-21. He was appointed minister to Switzerland and Netherlands representative to the League of Nations (1939). Van Kleffens fled to England after the German invasion in May 1940, becoming foreign minister for the Netherlands government-in-exile.

He attended the United Nations conference in San Francisco in 1945, the U.N. sessions in London in early 1946 and the following sessions in New York.

During the London meetings of the U.N. Security council, Van Kleffens and Andrei Vishinsky clashed over the latter's demand (Feb. 10, 1946) for an investigation of the Indonesian dispute. Van Kleffens replied that he would agree to an investigation provided it were limited to the original charge of whether or not Britain was threatening world security.

In the debate over Spain in the Security council meetings in New York, he opposed Dr. Lange's proposal that all U.N. members sever diplomatic relations with Franco's regime. Van Kleffens said the question of whether Franco remained in office was a "purely domestic matter" that should be decided by the Spanish people. He was named the permanent Netherlands representative to the U.N. Security council (Feb. 26, 1946) and was appointed to the U.N. Atomic Energy commission, May 3, 1946.

Korea. A part of the Japanese empire from 1910 until the surrender of Japan in 1945. In accordance with the agreement reached at Potsdam in 1945 by representatives of the major victorious powers, Korea was divided at the 38th parallel; the northern half was occupied by soviet forces and the southern half by U.S. forces. Korea is a peninsula on the mainland of Asia directly west of Japan. On the N. it is bounded by Manchuria, on the W. by the Yellow sea, and on the E. by the Sea of Japan. Area: 85,225 sq.mi., including 1,018 adjacent islands;

pop. (Oct. 1, 1940) 24,326,327. Capital, Seoul, pop. 935,464. Chief cities: Pyeng-yang (285,965); Fusan (249,734); Seishin (197,918). Religion: Buddhism, Confucianism and Taoism. In 1938 there were 494,500 Korean Christians.

History.—A national assembly convened by Yo Unkyang, leader of a group of Korean intellectuals, established the Peoples' Republic on Sept. 6, 1945. This had the support of the Peoples' party (Socialist) and the South Korea Communist party. It was later reorganized by the Russians into the Korean Peoples' Interim committee. Lieut. General John R. Hodge, commander of the U.S. occupation forces, refused to recognize the Peoples' Republic and organized the Korean Advisory council consisting of 11 members, all of the Korean Democratic party. General Hodge had the support of the former Korean provisional government led by Kim Koo and Dr. Syngman Rhee. The political division of Korea was criticized in Korea and abroad.

The United States and the soviet union failed to reach an agreement in 1946 for the establishment of a provisional native government as outlined by the Moscow Conference in Dec. 1945. The multiplicity of parties, more than 60, and the conflicting interests of the parties on the right and left made agreement difficult. On May 6 Soviet-U.S. negotiations for a provisional government broke down. The Russians attributed the failure to attempts by Americans to force consultation with reactionary parties. The United States announced that it was prepared to resume discussions at any time.

On Oct. 16 Major General Archer L. Lerch, U.S. military governor, announced the creation of an interim legislative assembly to give Koreans control of their government. The assembly—45 members elected by the people and 45 appointed by the U.S. military governor—met on Nov. 3. The U.S. military government retained the power to dissolve the assembly, approve new members and require new elections.

Education.—Attendance in elementary schools in May 1946 was 1,613,826, in secondary schools 99,308, and in higher schools 10,315. Korea had almost 5,000,000 children of ages 6 to 12, of which number fewer than 2,000,000 were in school. In 1946 a group of Koreans visited the U.S. to study the educational system.

Finance.—Korea suffered from serious inflation. Average family expenditures in Seoul were reported to have increased by 14,190% from 1937. Controls over sales of commodities were extended and a program for collection of summer grains to prevent hoarding and speculation was instituted in August by the United States military government. The official fixed rate of exchange in the U.S. zone was 15 yen for one U.S. dollar. The national budget for the fiscal year 1946-47 estimated expenditures at 11,800,212,360 yen and income at 8,013,393,996 yen.

Trade and Communications.—Korea's imports in 1939 were 1,388,448,284 yen; exports were 1,006,793,785. In 1939 there were 17,011 mi. of roads. By 1946 these roads were in poor condition. There were 2,619 mi. of government and 1,107 mi. of privately-owned railways in 1940. In 1946 available equipment was estimated at 472 locomotives, 250 flat cars, 3,600 box cars, 3,600 gondola cars and 12 tank cars. Roughly the same amount was thought to be in the Russian zone.

Agriculture, Manufacturing, Mineral Production.—Agriculture is the chief industry in Korea although there was considerable industrial development during the later years of Japanese rule. Due to a flood it was estimated that the 1946 harvests would be less than 60% of the 1940-44 average of 1,669,590 tons. On May 1 the U.S. occupation authorities established a daily staple food ration of 150 grams. Industry was greatly hampered after the war by a serious lack of technicians, due to the Japanese policy of employing its own nationals in these po-

sitions. In 1946 the military government in the U.S. zone took over all former Japanese owned property estimated at 80% of the total.

McCune, "Occupation Politics in Korea" *Far Eastern Survey* (Feb. 13, 1946); *The Voice of Korea*, Washington: Korean Affairs Institute. (P. A. V.)

Krug, Julius Albert (1907—), U.S. engineer and government official, was born on Nov. 23 in Madison, Wis. He received an M.A. degree from the University of Wisconsin in 1930. He was associated with the Federal Communications commission as a public utilities expert (1936-37) and became chief power engineer of the Tennessee Valley authority (1938-40), chief power consultant of the Office of Production Management (1941) and program vice chairman of the War Production board and director of the Office of War Utilities (Feb. 1943). Krug joined the navy in early 1944 as a lieutenant commander and helped restore French power facilities after the Allied invasion. In Aug. 1944, President Franklin Delano Roosevelt called Krug back to the WPB, of which, on Sept. 30, 1944, he became chairman. Following World War II, he ordered the lifting of curbs on manufacture of civilian goods. Krug resigned from the WPB on Oct. 4, 1945, and on Feb. 26, 1946, President Harry S. Truman appointed him secretary of the interior as successor to Harold Ickes. Krug played an important role in the government's attempts to mediate the coal miners' strikes in 1946. In the second coal strike, he rejected John L. Lewis' demands for changes in the agreement under which the government was operating the mines; when Krug insisted that the mine operators should also be consulted, Lewis declared the agreement at an end. The coal strike started Nov. 23, 1946. Krug then put into effect the distribution of natural gas through the Big and Little Inch pipe lines to alleviate the coal shortage.

Kuwait: see ARABIA.

Kyanite Minerals. Closely associated with kyanite are andalusite, dumortierite and sillimanite. Kyanite production in the United States was not reported in 1944 and 1945 but was 9,561 short tons in 1943. It is used in refractories and certain types of glass, supplies for the latter having been short. Imports, mostly from India, increased from 9,972 tons in 1943 to 14,554 tons in 1945, after dropping to 5,735 tons in 1944. Production of andalusite in Mono county, Calif., and of dumortierite in Pershing county, Nev., were not reported, but declined somewhat below the 1943 level. So far as was known no sillimanite production was made in 1945.

Labour Party, Great Britain. The by-elections during 1946 showed no sign of any substantial swing-away on the part of the electorate from the massive support given to the Labour party at the general election of 1945. One sequel to this victory was the foundation of a considerable number of new local party organizations, especially in small towns and rural areas, where there had been previously little or no organized propaganda except during elections. There was also a rise in individual membership of the local Labour parties. In parliament the Labour government carried through in 1946 a good instalment of the five-years' program on which it won the election. It nationalized the Bank of England, the coal industry and civil aviation; it passed into law the National Insurance act implementing the greater part of the Beveridge Social Security plan and got its National Health Service bill through the house of commons before the summer recess. It passed the New Towns act, providing for the building of a number of new towns under national auspices in pursuance of the policy of "dispersal" of population and industry. It brought family allowances and greatly improved old-age pensions into actual operation; and it carried through the new plan of compensation for industrial injuries. Its principal difficulties were in respect of food and housing and in international affairs. There was much criticism among Labour supporters of Ernest Bevin's foreign policy, especially in Greece and Spain and in relation to the soviet union; and the government's Palestinian policy also came in for much attack. As against this its Indian policy, which put an Indian national government into power, was widely approved; and a false move in Malaya was successfully retrieved.

In matters of organization the Labour party made a big effort in 1946 to improve the quality and amount of its educational work by starting numerous study groups and issuing special pamphlets designed for their use. It reached a new agreement with the Co-operative party, designed to remove friction over the choice of agreed parliamentary candidates; and it strengthened its central machinery for helping its local agencies in local government elections. It did well in the spring elections for county councils and for the smaller urban and rural authorities in the municipal elections of Nov. 1946. At the party conference held at Bournemouth in June 1946 the total membership for 1945 was given as 3,038,697, as compared with 2,672,845 in 1944. This included an increase of individual membership from 265,763 to 487,047, and of trade union affiliated membership from 2,375,381 to 2,510,369. Affiliated membership was likely to rise sharply as a result of the repeal of the Trade Unions act of 1927, as this repeal both allowed unions in the public services to rejoin the party and involved a return to "contracting-out" in respect of trade union political membership; *i.e.*, a member had now again to sign a form in order to avoid paying the "political levy" instead of signing a form indicating his willingness to pay it. The conference made no important new departures in policy, being anxious to allow the Labour government to proceed with its announced program. Mr. Bevin routed his critics for the moment in a highly effective speech, but did not prevent them from returning to the charge afterwards. The Communist party's application for affiliation was once more decisively rejected, and a renewal of it was excluded by a change in rules making other political parties definitely ineligible for affiliation. This did not affect the arrangement with the Co-operative party, which works in association with the Labour party, but is not affiliated with it. (See also CABINET MEMBERS; GREAT BRITAIN.) (G. D. H. C.)

Labour Unions. United States.—The outstanding feature of the labour history of 1946 was wide-

spread unrest and strikes. The first postwar year proved to be a period of unprecedented labour warfare. In spite of extensive union membership and universal machinery for bargaining collectively and settling issues peacefully, nearly all of the major industries of the country—oil, meat-packing, steel, automobile, railroad, coal-mining, telephone—were in whole or in part strike-bound at some time in the period from Sept. 1945 to Dec. 1946. In the calendar year 1946 more than 100,000,000 man-days were lost through strikes, not to speak of considerable indirect losses.

The issue which precipitated this strike wave was the postwar wage level. The Congress of Industrial Organizations unions, taking the lead in the wage controversy, demanded an increase of about 30% to compensate their members for the loss of war overtime. Unless wages were raised by such an amount, the C.I.O. argued, weekly earnings would drop, general purchasing power would decline and unemployment would increase. Some C.I.O. leaders argued also that substantial wage increases would require little or no rise in prices since higher wages would be paid for out of increasing efficiency and expanding profit margins. All of this was controverted by the employers who foresaw, as a consequence of a general wage rise, a proportionate rise in costs and prices.

The upshot of the controversy was the successive shutting down of key industries and the final settlement of the strikes for a wage advance of about 18 cents an hour. This amount became the pattern of settlement in the majority of industry. As soon as these advances began to be put into effect, they made their influence felt on prices. The Office of Price Administration came under increased pressure. The black market expanded and so many essential commodities were withdrawn from the regular markets that the OPA was discarded in the fall. Large-scale adjustment of prices to cost was made and by the end of 1946 the cost of living was 18% higher than at the beginning. The rapid and large rise in living costs raised the wage issue anew in the fall. John L. Lewis called his coal miners out a second time in the year in order to force another increase in wages. Unions generally made wage demands large enough to make up for the spurt in the cost of living. But determination of the character and outcome of this wage movement was deferred to 1947.

Whatever validity the wage and price decisions of 1946 had, the strikes which attended the year's developments turned public opinion against organized labour. Doubts were raised about the country's labour policy and in particular the terms and administration of the Wagner act. There was, in fact, a general feeling that perhaps the government had gone too far in encouraging unions and collective bargaining.

Because of these views the first effective legislative attack after the sit-down strikes of 1936-37 was made on the powers of unions. In congress representatives of both parties were critical of the behaviour of unions. A new labour bill, the Case bill, passed both the house and the senate with large majorities. The bill contained drastic restrictions on the rights and powers of organized labour. It was vetoed by the president and the veto was sustained. The temper of congress was revealed by the passage of the Hobbs bill, which brought unions under the Anti-racketeering act, and a bill aimed to regulate the activities of James C. Petrillo and the musicians' union. On several occasions it was made clear that the president shared some of the prevailing impatience with union conduct. In May the president appealed to the country and to the railroad employees to end a railroad strike and in November the administration obtained an injunction and fines to force the miners to call off their coal strike.

There is little question that labour trouble was an important factor in the Republican victories of November. The Republi-

cans captured both houses of congress and many local Democratic strongholds. Candidates backed by the political agencies of the C.I.O. and the American Federation of Labor were generally defeated and organized labour lost, for the time being, the hold it had long had on strategic points in the federal government. Hence, the way was paved for the revision of the national labour policy which had been in effect from 1933.

Competition between the A.F. of L. and the C.I.O. for membership, position and prestige continued in 1946. The A.F. of L. made the biggest capture through the reaffiliation of the United Mine Workers, an act by which the federation gained more than 500,000 members. On its part the C.I.O. persuaded the International Union of United Brewery, Flour, Cereal and Soft Drink Workers of America and the Amalgamated Lithographers of America, both old A.F. of L. unions, to join its ranks. Both the C.I.O. and the A.F. of L. made strong efforts to win the affiliation of the large independent unions of the Brotherhood of Railroad Trainmen and the National Federation of Telephone Workers, but with no success.

Although the position of the A.F. of L. abroad was reduced by the dissolution of the International Federation of Trade Unions and the rise of the World Federation of Trade Unions, which was sponsored by the C.I.O., much of the A.F. of L.'s prestige was restored by its designation as the official labour representative of the United States in the International Labour Organization (I.L.O.). This act was opposed by the C.I.O. and was followed by the C.I.O.'s withdrawal from the activities of the I.L.O. (*See also AMERICAN FEDERATION OF LABOR; BUSINESS REVIEW; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LAW; NATIONAL LABOR RELATIONS BOARD; STRIKES AND LOCK-OUTS.*)

(L. Wo.)

Great Britain.—British trade unions during 1946 were largely occupied with problems of the transition from war to peace and with the new issues raised by the existence of a Labour government pledged to the public ownership and operation of a number of key industries. The Trades Union congress, to which the overwhelming majority of important trade unions belonged, was reinforced by the reaffiliation of the leading unions of civil servants, which had been compelled to leave the congress under the provisions of the Trade Unions and Trade Disputes act of 1927, later repealed, which was passed by the conservatives as an aftermath of the general strike of 1926. The repeal of this act put the law back to where it was before 1927—all restrictions on the sympathetic strike were removed, the legality of general strikes was again uncertain since the leading authorities differed, the rights of picketing were restored to what they were under the Trade Disputes act of 1906 and trade unionists' contributions to the political funds of their unions were once more on a basis of "contracting-out"—that is to say, when a union had taken a ballot and secured a majority in favour of a political fund, all members were liable to contribute unless they signed a form expressing unwillingness to pay, but no member could be penalized in his industrial position in the union because he contracted-out.

Up to 1896 trades councils, local federations of trade union branches, were eligible for affiliation to the Trades Union congress. They were excluded in that year on the ground of overlapping, and only in 1924 did the congress form a Trades Councils Advisory committee and begin to use recognized trades councils as its agents in local matters. It was proposed in 1946 to substitute "registration" for "recognition" and to insist on the adoption of model bylaws as a condition of registration. Further use was to be made of the registered trades councils and of regional federations linking them up over wider areas, and a renewed effort was to be made to get all trade union branches in their areas to join. In 1946 only about half the membership of

the Trades Union congress was included in recognized trades councils. A few councils were unrecognized because they were alleged to be under communist influence.

Some controversy arose in 1946 over the question of the closed shop, especially in the coal mines and in other services controlled by public corporations. The National Union of Mine-workers wished to make membership of one of its branches or of a union recognized as catering for a special class of workers, such as deputies or clerical workers, a condition of employment under the new National Coal board; and the Transport and General Workers' union pressed a similar claim in respect of the London Passenger Transport board. No general demand for the closed shop was put forward or was likely to be so, and the Trades Union congress at its meeting in Oct. 1946 made it plain that, while the trade unions would continue to press for 100% membership, there was no general intention of insisting on membership of a particular union, among those regarded as bona fide, as a condition of employment. It was, however, becoming more important as wages and conditions came to be settled more on comprehensive national lines, by negotiation or arbitration, to avoid the existence of rival unions claiming to represent, and to negotiate for, the same bodies of workers; and special difficulties arose when disputes inside a union led to breakaways and to the setting up of rival unions which claimed separate recognition and negotiating rights. The Trades Union congress had a disputes committee through which it tried to adjust quarrels between affiliated unions but this did not cover breakaways, as the new unions formed by the seceders did not belong to the congress. A number of noncongress trade unions, including some breakaway bodies, formed in 1946 a new Federation of Independent Trade Unions; but this new organization had little strength and showed no sign of being able to make any effective challenge to the established societies.

The trade unions pressed the government hard to remove the wartime controls over the free movement of workers from job to job and from industry to industry, and the controls remained only in a few key industries seriously short of labour, notably agriculture and coal mining. A good deal of the special machinery set up during World War II for dealing with labour questions was retained and adapted to the conditions of peace. A National Production Advisory council, aided by regional boards, was set up to replace the wartime machinery of collaboration between employers' organizations and trade unions and served as a general advisory agency to the government on labour matters. In the factories the wartime system of joint production committees was retained and extended to nonwar industries. National production advisory committees were also being set up for particular industries; and the trade unions played a large part in the working parties appointed by the board of trade to report on the changes in organization, technique and machinery of collaboration needed in many of the main industries in order to enable them to improve their efficiency and to work in with the plans for national industrial development.

Internationally, the Trades Union congress played an active part in the establishment of the new World Federation of Trade Unions and in the winding up of its predecessor, the International Federation of Trade Unions. The trade secretariats for particular industries, formerly associated with the I.F.T.U., were reconstituted as trade departments of the W.F.T.U.

Lord Citrine (formerly Sir Walter Citrine), who was secretary to the Trades Union congress for 21 years, resigned in 1946 in order to become a member of the National Coal board. His successor was H. Vincent Tewson, who had been assistant secretary for a number of years. The Trades Union congress held its 1946 meeting in October at Brighton; the affiliated membership, based on 1945 returns, was 6,671,120, as compared with

6,575,654 in the previous year. The number of affiliated unions was 192, as compared with 191. The smallness of the increase, despite the reaffiliation of several trade unions of civil servants, was the result of the large number of retirements from industry of women workers and elderly persons at the end of World War II. In 1939 the affiliated membership was about 5,000,000.

Lacrosse. The lacrosse team of the United States naval academy at Annapolis, Md., won the 1946 national collegiate championship.

At the meeting of the U.S. Intercollegiate Lacrosse association at the close of the 1946 season it was announced that 30 colleges would play the game in 1947. Dr. Carl P. Schott, re-elected president of the body, said that lacrosse would not be included in the 1948 Olympic schedule. It is necessary for ten different nations to participate in the sport before it can be added to the Olympic schedule. The only countries represented by lacrosse teams in 1946 were the United States, England, Canada and Australia.

On the distaff side a team of women from Philadelphia, Pa., captured the national title with a victory over Westchester, N.Y., 6-5.

•(T. J. D.)

La Guardia, Fiorello H. (1882-), U.S. politician and government official, was born Dec. 11 in New York city. He served in U.S. consulates in Hungary and Austria (1901-06) and was graduated from New York university law school in 1910. La Guardia was congressman from New York, 1917-21 and 1923-33. During World War I, he commanded the U.S. flying force on the Italian front. He was mayor of New York (1934-37) and was re-elected for two terms ending in 1945. He refused to run for another term.

President Franklin Delano Roosevelt appointed him chairman of the U.S. section of the Canada-U.S. permanent joint board on defense in Aug. 1940, and director of the Office of Civilian Defense in May 1941. On March 21, 1946, he was appointed director-general of the United Nations Relief and Rehabilitation administration. In the spring of 1946, he made several "wheat trips" to the midwest appealing to the farmers to grow more grain for U.N.R.R.A. distribution, and in the summer he visited several European countries in connection with his duties. La Guardia later recommended establishment of a new agency under supervision of the U.N. general assembly to carry on relief work after U.N.R.R.A.'s mandate expired. On Dec. 13, 1946, he relinquished his position as director-general to Gen. Lowell W. Rooks.

Lamb: *see* MEAT.

Lange, Oscar Richard (1904-), Polish statesman, was born July 27 in Tomaszow, Poland. He studied at the University of Cracow, receiving his doctor of laws degree in 1928, and in 1931 he joined the faculty of Cracow as a lecturer in economics and statistics.

He went to the United States in 1934 as a fellow of the Rockefeller foundation, studied at Harvard university and at the University of Minnesota and became a lecturer at the University of Michigan in 1936. Two years later (1938) he joined the University of Chicago as assistant professor of economics, becoming a full professor in 1943. In the latter year he was also naturalized as a U.S. citizen. In the summer of 1945 Dr. Lange relinquished his U.S. citizenship to become Poland's ambassador to the U.S.

Dr. Lange, who was also Poland's delegate to the United Nations, was the only delegate in the Security council who sided with the soviet union during the tense Iranian dispute. He also raised the controversial Franco issue before the council and on April 17, 1946, he formally asked that it recommend that U.N. member states sever diplomatic relations with the Franco regime on grounds that it threatened international peace and security. The Security council rejected (June 24) Dr. Lange's resolution by a 7-4 vote; Lange's subsequent resolution that the International Court of Justice be closed to all axis-installed governments was also rejected (Oct. 15) by a similar vote.

Laos: *see* FRENCH COLONIAL EMPIRE.

Lard. The United States production of lard in 1946 began to recover from the low level of 1945 and reached 2,100,000,000 lb. compared with 2,075,000,000 lb. in 1945 and the prewar average of 1,624,000,000 lb., 1935-39. Heavy exports of lard and smaller stocks held supplies for civilian consumption down near to the level of 1945. Total exports amounted to somewhat less than the 600,000,000 lb. exported in 1945, a large part of which was taken from accumulated government stocks. The production of lard dropped sharply in September with the restoration of the Office of Price Administration but recovered gradually as hogs were decontrolled in October. The price of lard was steady at 12.8 cents per pound through 1945 and up to July 1946. It then rose to 20.9 cents in July, 31.4 cents in August and declined to 17.3 cents in September. On Oct. 15 price ceilings were ended and prices again rose in response to the strong demand. Future trading in lard was resumed Nov. 4 at Chicago with July futures selling at 24 cents per pound, cash lard at 40 cents. (*See also* HOGS; MEAT; VEGETABLE OILS AND ANIMAL FATS.)

Latvia. One of the Baltic states of northeastern Europe, north of Lithuania, south of Estonia; an independent republic 1920-40, a republic of the U.S.S.R. 1940-41, part of the German "Ostland" 1941-44, reintegrated into the U.S.S.R. after the reconquest of 1944-45. Area 25,395 sq.mi.; population (census 1935) 1,950,502, (est. 1940) 1,990,000. Capital, Riga (393,211 in 1939); the other principal city is Liepaja (57,098 in 1935). Language, Latvian. Religion, Christian (Protestant 56%; Roman Catholic 24.5%; Greek Catholic 9%; Greek Orthodox 5.5%). Chairman of the Council of Ministers, 1946: Vilis Lacis.

History.—Like its neighbours Estonia and Lithuania, Latvia was forced to bow first to one, then to another, of the great warring powers. Mass deportations were carried through by both the conquerors, and the economy was forced through violent changes. After the soviet reconquest of 1944-45 the constitution of 1940-41 was reinstituted. Many thousands fled to Germany or were transported there as labourers; others risked their lives to evade both Russians and Germans and escaped to Sweden. The United Nations Relief and Rehabilitation administration estimated that in 1946 there were still 83,639 Latvians in the U.S., French and British zones of occupied Germany. Most of these remaining people did not want to return to soviet Latvia, and it was to care for just such situations that the International Refugee organization was set up.

In contrast to the bitter and tragic reports on conditions in Latvia which reached the west from refugees and from the diplomats of the independent regime of 1939 were the reports from Russian sources of reconstruction and progress. One western visitor to Latvia, writing in *Soviet Russia Today*, said that the plan established in 1945 was to allow agricultural production to decline about 10% from the 1940 level but to double industrial production. He was told by workers that with machines from Germany and raw materials from the U.S.S.R. they were receiving the necessary supplies and equipment "to develop our country." Agriculture was left on the basis of individual small peasant proprietorship, and 70,000 peasants were said to have received land after the establishment of the soviet republic. Farm animals were provided by the state on a ten-year loan system, and sales were increasingly in the hands of co-operative marketing organizations. Private trade was permitted in retail stores also, and there was no general attempt at collectivization. Factories, however, were nationalized (and the land for distribution to the peasants obviously came from dividing larger estates). The same report insisted that opposition to the communist government was small, and was fomented from the outside. Accounts in the *Moscow News* spoke of a 50,000,000 rouble project to restore the port of Riga, and of great electrical and metallurgical developments under way.

Great Britain and the United States continued through 1946 to refuse to recognize the soviet regimes in Latvia, Lithuania and Estonia.

Education.—In 1938-39 there were 1,987 elementary schools and 122 secondary schools. Enrolment at the University of Riga was 7,281. Total educational enrolment numbered 271,197—one-seventh of the population, with 13,106 teachers, and about 15% of the national budget went to education. There were 912 public libraries.

Finance.—The monetary unit was the lat (=19.3 U.S. cents at par, established as equivalent to the Swiss franc in 1921). In 1939 the budget estimate envisaged revenues of 190,878,000 lats and expenditures of 190,481,000 lats. The budget estimate for 1945 was 792,790,000 roubles.

Trade and Communication.—Imports in 1938 were 227,336,000 lats; exports 227,204,000 lats. Chief articles of import were industrial machinery, agricultural machinery, automobiles and accessories, coal, cotton textiles, cotton (raw) and wheat. Chief articles of export were timber, flax, plywood and butter. Exports went chiefly to Great Britain, Germany, the U.S.S.R. and the Netherlands. Imports were primarily from Germany, Great Britain, the U.S.S.R., Sweden and the United States. In 1940 the Latvian state railways operated more than 2,200 mi.; bus lines more than 2,800 mi. The principal harbours were Riga, Liepaja and Ventspils.

Agriculture.—The principal crops with their yields (in short tons) were as follows in 1939: rye, 493,830; barley, 245,041; oats, 534,395; wheat, 233,247; potatoes, 1,807,882; flax, 54,123. Livestock included 414,470 horses, 1,271,730 cattle, 1,469,570 sheep, 891,470 pigs, 4,729,120 poultry, 222,460 beehives. About 66% of the employed were in agriculture, cultivating some 237,000 farms, 80% of which were owner-operated.

Manufacturing.—After the decline in 1931 and 1932, Latvia's industrial production rose rapidly to a general index figure of 148 in 1937 (based on 100 in 1930). Strong efforts were made up to 1939 to increase the self-sufficiency of the country.

At the beginning of 1939 about 5,970 industrial establishments employed 98,500 persons, and in 1938 produced a value of 695,000,000 lats. About 15% of the employed were in industry and 5% in commerce. Chief industries were foodstuffs, wood and paper and textiles.

Law. The change-over to peacetime production in the United States resulted in the rapid liquidation of war agencies which gave way to a smaller group of even more transitory reconversion agencies. The year 1946 definitely marked the end of an era of unprecedented extension of government controls over the nation's manpower and economic life. Some of the peacetime agencies, created before World War II to carry out New Deal projects, seemed likely to remain a permanent part of the federal system, but others seemed slated for discard under the gathering attack of opposition forces.

Congress attempted to deal with the nation's gravest postwar problem through the passage of the Atomic Energy act, which assigned the development and control of atomic energy to a five-man civilian commission to be appointed by the president subject to senate approval. The new law reserved to the federal government exclusive control over the production, ownership and use of fissionable material and prescribed the death penalty for disclosure of secrets in that field. The United Nations assembly also created a commission to study the international control of atomic energy.

Mopping-up operations continued against war criminals in the defeated nations and against war law violators in the United States. The long, dramatic trial of nazi leaders before a four-nation tribunal at Nuernberg established new legal procedures

and new applications of existing principles of law. Never before had the top officials of a defeated nation been tried and convicted by an international court for war crimes, crimes against humanity and crimes against the peace. Ten defendants were executed and seven sent to prison. Hermann Goering evaded the death penalty by suicide. The trial of Japanese Generals Tomoyuki Yamashita and Masaharu Homma followed a more traditional pattern but reached a similar result. They were sentenced to death by U.S. military commissions for violations of established laws of war. In the United States the prosecution of persons charged with violating price control, rationing, selective service and other emergency laws proceeded with waning enthusiasm and the prospect that the courts would soon be cleared of cases docketed.

To meet the recurrent demand for greater efficiency in government, congress planned its own revamping through the Legislative Reorganization act of 1946, which provided for the merger of 32 senate committees into 15 and 48 house committees into 19. The act provided for a new joint committee of both houses on national defense to replace their respective committees on military and naval affairs. It further directed the taxing and appropriation committees of both houses to meet jointly at the opening of each session of congress for the purpose of balancing expenditures against revenues. Salaries of senators and representatives were raised from \$10,000 to \$12,500 a year, and they were each allotted \$2,500 annually for expenses.

Congress also passed the Employment act of 1946 as a compromise measure in response to pressure for a "full employment act." The resulting law declared it to be the continuing policy of the federal government to co-ordinate and utilize all its functions and resources to promote maximum employment, production and purchasing power within the framework of a system of free competitive enterprise. The president was directed to submit to every session of congress an economic report, including an analysis of "current and foreseeable trends in the levels of employment, production and purchasing power," a review of the government's economic program, a statement of goals, and legislative proposals. The act also established a council of economic advisers to assist the president in preparing his report and a joint committee of congress to study the report and make recommendations for action.

Only the more important legal developments of general interest are reported in this article.

Administrative Law.—The fight for over-all regulation of federal administrative agencies, in abeyance during the war, was revived. It resulted in the enactment of the much-debated McCarran-Sumners bill, which in its final form became the Administrative Procedure act of 1946. This new law (1) provided that agencies shall issue as rules certain specified information concerning their organization and procedure, (2) laid down the essentials of several forms of administrative proceedings and the limitations on their powers, (3) provided in more detail the requirements for administrative hearings and decisions where such hearings are required by statute, (4) assured a remedy by judicial review for every legal wrong due to agency action except so far as statutes preclude such review or the action is within the scope of agency's legal discretion, and (5) set up a system of semi-independent trial examiners recruited under civil service to preside over hearings. The act did not attempt a codification of administrative law, however, nor introduce procedural innovations, but it extended to all agencies the requirement of internal separation of functions between (a) investigating and prosecuting officers and (b) hearing or deciding officers.

Decisions of the U.S. supreme court during the year applied

some of the long-established rules incorporated in the Administrative Procedure act. Thus the court denied relief in several cases because the petitioners had failed to exhaust their administrative remedies before appealing to the courts. The corollary to this rule (that if a party has exhausted his administrative remedies he is entitled to a judicial review) was applied by the high court in appeals from draft board classifications. Registrants who have completed procedural requirements by reporting for induction and being accepted for service may then properly apply to court for a reconsideration of their draft status (*Estep v. U.S.*; *Smith v. U.S.*, 327 U.S. . .).

The investigative powers of government agencies were several times upheld by the high court. In one case Office of Price Administration investigators had entered a gasoline station without a search warrant and removed ration books, permits and other government-issued papers which were used as evidence to convict the proprietor of black market operations. In another case Federal Bureau of Investigation agents, during an audit of a public contractor's books, took a cancelled check which helped convict him of making false claims against the government. No constitutional rights had been violated in either case, the court said, in view of trial court findings that the defendants had consented to the removal of the papers. In a third case the court sustained the right of the wage-hour administrator to force newspaper publishers to produce their books in response to a *subpoena duces tecum* for examination in proceedings under the Fair Labor Standards act.

The actions of various other federal agencies were also supported by the supreme court in decisions which approved: the uniform system of accounts required by the Federal Communications commission of a telephone company; findings of the Interstate Commerce commission that a refiner of crude oil products operating an interstate pipe line was a common carrier even though it transported only its own products; the wide discretionary authority exercised by the ICC in issuing certificates of convenience and necessity to motor carriers and a Great Lakes carrier; the power of the Federal Power commission as an agency of the federal government to issue a licence for a power project on navigable water without complying with state regulations; the refusal of the FCC to renew the radio licence of a broadcasting company which deliberately misrepresented its stock ownership to the commission; orders of the National Labor Relations board made in accordance with its own formal rules of procedure; death sentences imposed by the Securities and Exchange commission on holding companies where there was no showing that such a remedy was unwarranted in law or without justification in fact; and tax court rulings where the record disclosed no clear-cut mistake of fact.

The supreme court, however, rapped the knuckles of the postmaster general for assuming powers not delegated to him by congress when he withheld second-class mailing privileges from *Esquire* magazine on moral grounds. The court also declared that the Social Security board strayed out of bounds when it refused to classify "back pay" allowed an employee under the National Labor Relations act as "wages" under the Social Security act, since congress had laid down no such restriction in either statute.

Agriculture.—Congress endeavoured to stimulate agricultural research and experimentation through two enactments. The program set up in 1935 under the Bankhead-Jones act was augmented by amendments providing for additional research on all types of farm problems to be carried out through grants to state agricultural experiment stations and the co-operation of such stations and the department of agriculture in research projects of both national and regional significance. The Agricultural Marketing act of 1946, adopted at the same time, declared a sound,

efficient and privately operated system for the distribution and marketing of farm products to be essential to the national welfare and stated that it was the policy of congress to promote a scientific approach to the problems of marketing, transportation and distribution by providing for continuous research to be carried on by state and federal agencies in co-operation with private producers and industrial organizations. The secretary of agriculture was directed to set up an advisory committee to assist in this program, and substantial appropriations were granted for the support of research, state and federal. Both this law and the amendments to the Bankhead-Jones act authorized the agriculture department to enter contracts with private organizations for the use of their facilities and personnel on research projects.

Congress also passed the Farmers Home Administration act to simplify and improve credit services to farmers, to promote farm ownership, to authorize government insurance of loans to farmers and to create preferences for loans to enable veterans to acquire farms. This law abolished the Farm Security administration and certain functions of other agencies and directed the liquidation of resettlement projects. It amended the Bankhead-Jones Farm Tenant act to provide production and subsistence loans to farmers and stockmen and otherwise improve credit service to farmers.

Aliens and Citizenship.—In a 5 to 3 decision the supreme court ruled that an alien may be admitted to citizenship even though he declares, for religious reasons, that he would not bear arms in defense of the United States. The majority of the justices thus abandoned the contrary position taken by the court more than 15 years earlier in the *Schwimmer*, *Bland* and *Macintosh* cases (*Girouard v. U.S.*, 66 S. Ct. 826).

The denaturalization of a pro-nazi on the ground that he procured his citizenship certificate through fraud was affirmed by the supreme court. There was "clear, unequivocal and convincing proof" of his calculated, systematic activities on behalf of Adolf Hitler before and after his naturalization, thus fulfilling the requirements of the rule announced in the 1943 *Schneiderman* decision. The court, however, reiterated its previous position that naturalized citizenship is not a second-class citizenship but confers substantially the same rights, duties and privileges as belong to citizens born in the United States (*Knauer v. U.S.*, 66 S. Ct. 1304).

Congress authorized the admission to the United States of persons indigenous to India and the Philippine Islands and made them eligible for naturalization.

The Nationality act was also amended to provide citizenship for a child born abroad, one of whose parents is an alien and the other a citizen who has served honourably in the armed forces of the United States during World War II. Previously such a child became a citizen only if the citizen parent had a total of 10 years' residence in the United States, 5 of which occurred after his or her 16th birthday. Thus under the old law no serviceman father under 21 years of age could transmit citizenship to his child, if the mother was an alien.

Through another amendment congress arranged for the speedy naturalization of persons who had lost their citizenship by voting in a political election in a country not at war with the United States in World War II.

Bankruptcy.—A long-advocated reform was achieved by the Referees' Salary act which wiped out the old system of compensating referees in bankruptcy through fees paid out of estates in litigation and set up a system of full-time salaried referees.

The Municipal Bankruptcy act, which had been due to expire on June 30, was made a permanent part of the bankruptcy code. It was also amended to extend relief to municipalities and other

local authorities in connection with issues of revenue bonds, and procedural provisions were strengthened.

Business Regulation.—The government's long battle to break up monopolistic power in the tobacco industry resulted in a 6 to 0 supreme court decision against the "Big Three" tobacco companies and some of their officers. The court approved fines totalling more than \$250,000 against the defendants who were found guilty of the crime of monopolization under section 2 of the Sherman act. It was not necessary for the government to prove that the defendants actually asserted the power to exclude existing or potential competitors from the market. Proof that they combined to acquire and maintain the power to raise prices and exclude competition was sufficient to show a violation of the antitrust laws, even though such power was not exercised (*American Tobacco Co. v. U.S.*, and other cases, 66 S. Ct. 1125).

Another blow at monopolistic practices was struck when the supreme court affirmed a judgment for \$360,000 against a group of motion picture distributors and theatre owners for combining to deprive an independent Chicago, Ill., theatre of first-run motion pictures. Through the block booking system the respondents had favoured competing theatres which they controlled, causing losses to the petitioner's theatre for which he was entitled to treble damages under the Sherman act (*Bigelow v. RKO*, 327 U.S. 251).

In the first important application of the much-discussed "death sentence" clause of the Public Utilities Holding Company act of 1935, the supreme court ordered the North American company to divest itself of all but one of its utility systems. This company, the court said, was the "pinnacle of a great pyramid of corporations," which operated electric and gas utility properties having an aggregate capital value in excess of \$2,300,000,000. It dominated a system covering 17 states and the District of Columbia. The court brushed aside the company's contention that its business was solely the acquisition and holding of securities of subsidiaries for investment purposes and that it was therefore not engaged in interstate commerce (*No. Am. Co. v. SEC*, 327 U.S. 686). The high court also affirmed SEC orders for the dissolution of two subholding companies in the Electric Bond and Share company holding system based on findings that there was an unfair and inequitable distribution of voting power whereby the holding companies controlled the operating companies through disproportionately small investments (*Am. P. & L. Co. v. SEC*, 67 S. Ct. 133).

The SEC was again sustained by the supreme court when it approved a finding that an offering by one corporation of units in a citrus group development combined with a service contract by an associated company constituted an investment contract within the meaning of the SEC act. It was immaterial whether the investment was speculative or non-speculative, the court said.

Civil Rights.—In a series of important decisions the supreme court disapproved activities of local, state and federal officials which it held to be invasions of civil liberties. The manager of a company-owned town in Alabama and the manager of a federally-owned village in Texas had no right, the court said, to stop members of Jehovah's Witnesses from handing out tracts on the streets of their communities. Such interference with religious zealots, who campaigned for converts from door to door, abridged freedom of religion and of the press. State laws, making it a crime to refuse to leave premises when ordered out by the owners, did not justify the expulsion of missionaries (*Marsh v. Alabama*, 66 S. Ct. 276; *Tucker v. Texas*, 66 S. Ct. 274). The supreme judicial court of Massachusetts also supported the right to proselytize. It upheld an injunction obtained by Jehovah's Witnesses against city officials and a judge restraining them from continuing to arrest and convict members of that sect for distributing handbills in the street in violation of a municipal

ordinance, which the court ruled unconstitutional. Equity will protect individual rights for the same reason that it protects property rights, the court said (15 L.W. 2366).

The U.S. supreme court further supported freedom of conscience in a decision approving the right of a Seventh Day Adventist to become a citizen even though he would not promise to bear arms in defense of the United States. The court's previous position to the contrary was thus overruled (See *Aliens and Citizenship*, this article). The tolerance of the supreme court justices, however, did not extend to the approval of polygamy even though motivated by religious belief. Such belief was no defense in a prosecution for violation of the Mann act. (See *Criminal Law*, this article.)

The supreme court also struck at discrimination against Negroes by knocking out the Jim Crow segregation of bus passengers in interstate traffic. A Negro woman had been ejected from a bus travelling between Virginia and Maryland because she refused to move into a seat reserved for Negro passengers. Her subsequent fine for violating a state law requiring separation of white and Negro passengers on buses was reversed by the high court on the ground that it placed an undue burden on interstate commerce. The need for national uniformity in such traffic outweighs the right of the states to exercise their police power, the court said (*Morgan v. Virginia*, 66 S. Ct. 1050). So too the California supreme court rebuffed racial discrimination in ruling that a union having a closed shop agreement with an employer had no right to exclude Negroes from its membership. On the other hand, the supreme court of Arkansas approved the state's white primary law prohibiting Negroes from voting for state officials in Democratic primaries. The act, passed in 1945, was designed to avoid conflict with the federal constitution by setting up a separate primary for federal officials in which Negroes are permitted to vote.

A law prohibiting discrimination in employment because of race, creed, colour or national origin was passed in Massachusetts, thus bringing to five the number of states which had Fair Employment Practices acts.

Attempts to curb the freedom of the press were rebuked by the supreme court in two important decisions. The conviction of the publisher and editor of the Miami *Herald* for criticizing state courts for laxity in prosecuting gambling houses was reversed. Editorials and a cartoon charging that the courts showed special leniency toward such establishments did not constitute a clear and present danger to the administration of justice, as required under the ruling in the Bridges case. The right to a free press includes the right to criticize even though such criticism may be scurrilous or erroneous (*Pennekamp v. Florida*, 66 S. Ct. 1029). In its second blow on behalf of the press, the court rebuked the postmaster general for attempting to wield a power of moral censorship over periodicals through the denial of second-class mailing privileges to *Esquire* magazine. It rejected the postmaster's views that he could use such privileges as a special award to give competitive advantages to "good" magazines over those he considered "bad." The postal department has no power to prescribe standards for literature or art. To uphold the postmaster in this respect would grant him a power of censorship (*Hannegan v. Esquire, Inc.*, 327 U.S. 146).

Constitutional Law.—In a novel application of the due process clause the supreme court affirmed a court of claims award of \$2,000 against the United States in favour of a farmer for depriving him of the use of his land in raising chickens. The low flight of army bombers from an adjoining airfield frightened the chickens into committing suicide by throwing themselves against a fence. The consequent loss of enjoyment of the land was a "taking" of property requiring compensation under the federal constitution (*U.S. v. Causby*, 66 S. Ct. 1062).

In another decision of unusual interest the supreme court ruled unanimously that an act of congress ordering the removal of three federal employees from the government payroll for conduct alleged to be inimical to the United States was a bill of attainder prohibited under the constitution. Such a law attempted to inflict punishment not prescribed by any previous law and without the safeguard of a judicial trial (*U.S. v. Lovett*, 66 S. Ct. 1073).

Other important decisions involving points of constitutional law are reported throughout this article.

Criminal Law.—New rules, establishing uniform procedure for criminal cases in all federal courts, went into effect March 21, 1946. They included such simplifications as a short form of indictment to replace the involved forms which had been in use for a century, a single motion to dismiss instead of various technical motions, removal of the surprise element in alibi defenses and reduction of the costs of appeals for defendants.

Thirty-nine states signed the Interstate Parole and Probation compact. Through a system of state administrators it became possible for a parolee to "begin life over" in a new state under improved conditions, subject to safeguards against the abuse of the system to evade the authority of the state where the parolee was originally convicted.

Congress added teeth to the Anti-Racketeering act of 1934 through amendments providing fines up to \$10,000 and imprisonment up to 20 years for any one committing robbery or extortion which in any way obstructs, delays or affects interstate commerce. The law relating to larceny in interstate commerce was extended to apply to air transportation. Certain coercive practices affecting radio broadcasting were outlawed by the Lea or so-called "anti-Petrillo" act, amending the Communications act of 1934. The use of threats to compel radio stations to hire persons for broadcasting in excess of those needed and certain similar practices were made criminal offenses. A district court judge in Chicago held this statute unconstitutional. Under the antilobbying section of the Legislative Reorganization act of 1946 congress required the registration of persons who engage for profit in influencing the passage or defeat of federal legislation and the disclosure by registrants of their expenditures in connection with lobbying. Severe penalties were provided for violating these requirements.

The transportation of plural wives across state lines by members of the Fundamentalist cult of the Mormon faith was held by the supreme court to violate the Mann act. The conduct of the defendants was not justified on the ground that it was motivated by their religious beliefs (*Cleveland v. U.S.*, 67 S. Ct. 13). On the other hand, the government failed in its prosecution of members of the same cult under the federal Kidnapping act. Plural or "celestial" marriages did not violate that statute even though they involved the transportation of women, some of them minors, for immoral purposes, since there had been no involuntary seizure or detention (*Chatwin v. U.S.*, 66 S. Ct. 233).

The conviction of Edna W. Ballard and her son, leaders of the "I Am" religious cult, for use of the mail to defraud, was reversed in a 5 to 4 ruling of the supreme court on the ground that the proceedings were invalid because women were excluded from the grand and petit jury panels (*Ballard v. U.S.*, 67 S. Ct. 261).

The supreme court ruled that the federal Anti-kick Back act does not apply to labour union officials charged with forcing workers on federal projects to surrender part of their wages under threats that they will otherwise be dismissed (*U.S. v. Carbone*, 66 S. Ct. 734).

Family Relations.—The long-established common law right to recover for alienation of affections was bolstered by two court decisions. An Illinois statute purporting to prohibit "heart

balm" suits was held unconstitutional by the state supreme court for technical reasons and also because it violated the guarantee of the Illinois constitution that every person shall have a remedy for his injuries and wrongs (*Hecht v. Schupp*, 68 N.E. 2d 464). A decision of the U.S. circuit court in Chicago broke new legal ground in approving the right of children living in Pennsylvania to maintain a suit for damages against a woman in Illinois for alienating their father's affections. The children alleged that the defendant had lured their father away from them and their mother and induced him to stop contributing to their support. The court ruled that this complaint clearly stated a wrong for which the law should provide a remedy even though there was no specific authority for such an action in the court decisions or statutes of Pennsylvania or Illinois (*Daily v. Parker*, 152 F. 2d 174). These two decisions released a flood of alienation suits in Illinois. By the year's end more than 100 complaints asking an aggregate of more than \$10,000,000 for the stolen affections of a parent or spouse were pending in Chicago courts.

Labour.—The most publicized and provocative supreme court ruling of the year was its portal-to-portal decision in the Mount Clemens Pottery company case. Applying the general principles of its prior rulings on miners' underground travel time, the court held that time spent by employees in walking to work and preparing for their work on the employer's premises is working time within the overtime pay provisions of the wage-hour act, since it is required by the necessities of the employer's business and is under the employer's complete control. The court, however, remanded the case to the trial court for the determination of the amount of portal-to-portal work actually performed and the resulting damages under the Fair Labor Standards act, stating that if it were found that travel and make-ready time were negligible, no award should be made (*Anderson v. Mt. Clemens Pottery Co.*, 66 S. Ct. 1187). This decision set off a nationwide wave of law suits for the collection of portal-to-portal overtime wages. By the end of the year the total amount of such claims filed in court ran into many billions of dollars.

In a series of rulings the supreme court held that the wage-hour act was applicable to the employees of a newspaper publisher even though only about 45 of the newspaper's 9,000 to 11,000 copies daily went to out-of-state subscribers; to workers employed by an electrical company which dealt in motors and generators with customers who produced goods for interstate commerce; to employees of a window-cleaning company engaged wholly within the state of Michigan in washing windows of buildings used for the production of goods for interstate commerce; to mechanics employed by a service company in repairing and maintaining vehicles operated by a company transporting automobiles and army materials in interstate commerce; and to maintenance and service employees of a building tenanted by occupants who receive, work on and return, in intrastate commerce, goods belonging to nonoccupants who afterward ship substantial parts of such products to other states.

The 1942 ruling of the National Labor Relations board that foremen may choose the same union to represent them as production and maintenance workers was upheld in circuit court decisions. In one case the court stated that foremen are part of management in the obligation to get out the work and negotiate grievances, but they should be classified as employees for the purposes of negotiating over their own wages and conditions of labour through bargaining units free from employer control. Plant guards, who were also members of a municipal police force, were held not properly represented by a union of production employees.

Voters in Arkansas, Florida, Nebraska, South Dakota and Arizona approved state constitutional amendments outlawing

the closed shop, and in Massachusetts an act requiring labour unions to file with the state declarations giving details as to their organization and finances was approved by referendum.

The year ended with public attention focused on a labour-management drama in which John L. Lewis, president of the United Mine Workers, held the centre of the stage. A U.S. district judge had issued an injunction restraining Lewis and his union from breaking a contract with the government in connection with the operation of soft coal mines and from striking against the government. The miners stopped work, ignoring the order on the ground that it was unconstitutional and violated the Norris-La Guardia act. The court then entered a fine of \$3,500,000 against the union and \$10,000 against its president for contempt of court. The supreme court agreed to review the lower court's contempt conviction without requiring that the case should first go to the circuit court of appeals.

Military Justice.—The supreme court dealt with two situations testing the extent of military jurisdiction. It refused writs of habeas corpus to the Japanese generals, Yamashita and Homma, who had been sentenced to death by military commissions for permitting their troops to commit atrocities in the Philippines. The court pointed out that the trial of enemy aliens by military tribunals for violations of the law of war had been sanctioned by congress. The rulings of the commissions on evidence and the conduct of the trial were not reviewable by the judicial branch of the government which could only pass upon the validity of the organization of such commissions (*In re Yamashita*, 66 S. Ct. 340).

The second test of military jurisdiction arose in Hawaii where military courts had imposed jail sentences upon a Honolulu businessman for embezzlement and a naval workman for assaulting marine corps sentries. Both defendants were released by the supreme court on writs of habeas corpus. The Organic act, which created the territory of Hawaii, permitted the declaration of martial law, the court said, but civilians could not thereby be deprived of their right to a jury trial before a civilian court. The armed forces do not acquire an absolute right to supplant all civilian laws and procedures with military regulations and tribunals under a declaration of martial law where conditions are such as to indicate no necessity for such drastic action (*White v. Steer*; *Duncan v. Kohanamoku*, 327 U.S. 304).

A thorough revision of the army's courts-martial system was recommended by an advisory committee on military justice appointed by the American Bar association at the request of Secretary of War Robert P. Patterson. The committee, headed by Arthur T. Vanderbilt, found serious defects in the operation of the system, namely: (1) a lack of sufficient attention to and emphasis upon the military justice system and of preliminary planning for it; (2) a deficiency of qualified, trained men to act as members of courts-martial; (3) domination of courts-martial by commanding officers; (4) ineffectiveness of defense counsel because of (a) lack of experience and knowledge and (b) lack of a vigorous defense attitude; (5) excessively severe sentences, sometimes fantastically so; (6) discrimination between officers and enlisted men, both as to bringing charges and as to convictions and sentences; and (7) inefficient and inadequate investigations before trial. The committee recommended that: (1) qualified enlisted men be permitted to sit on courts trying enlisted men; (2) the law members of each court and defense counsel be appointed by the judge advocate general's department from its personnel instead of by the commander who orders the trial, as at present, but such commander should continue to name the trial judge advocate; (3) it be made unlawful for commanders or others to try to influence the action of appointing or reviewing authority in connection with courts-martial or to reprimand a court on its members; (4) the judge advo-

cate general's department be enlarged sufficiently to provide trained lawyers for courts-martial duty; and (5) a board of officers be named to make a continuous study of desirable changes in the Articles of War and courts-martial procedure.

Patents, Trade-marks and Copyrights.—The Atomic Energy act of 1946 prohibited the granting of patents for inventions and discoveries useful solely in the production of fissionable material; revoked any rights already conferred for such inventions; required that such inventions and discoveries be reported to the commission created by the act; and authorized the commission to take over and pay just compensation for such inventions and discoveries. Other 1946 enactments amended provisions with reference to damages for patent infringement and temporarily extended time for filing applications for the restoration of patent rights which had lapsed during World War II.

The United States signed an accord making available to the nationals of the 12 participating governments full rights to use (without royalty payments) all former German-owned patents issued by such governments, subject to existing rights lawfully acquired by non-Germans.

The entire law of trade-marks was revised and codified by the Lanham Trade-mark act which was passed July 5, 1946, to become effective July 5, 1947. This new statute superseded all prior federal trade-mark laws; gave trade-marks an independent status as property assignable without the accompanying transfer of the business with which they were originally connected; extended protection to the identification of services as well as goods; increased the benefits derived from registration; made it possible, except in a few instances, for a trade-mark to become incontestable after five years' continuous use from the date of registration; and created a new right to register sound trade-marks such as musical signatures identifying the sponsors of radio programs. Another enactment authorized the president to extend time for the renewal of trade-mark registrations by foreign owners where war conditions had prevented them from so doing, provided that such owners are nationals of countries according equal treatment to U.S. citizens in the same respect.

A copyright convention was signed by representatives of the American republics extending reciprocal protection to authors of literary, scientific and artistic works in their respective countries, but at the year's end this treaty had not yet been ratified by the U.S. senate.

Reconversion.—On Jan. 4 the president appointed a director of liquidation in the Office for Emergency Management to expedite the closing out of war agencies; and after much shifting, merging and reshifting of emergency offices, administrations and corporations, the president finally on Dec. 12 abolished a group of agencies, including the Office of War Mobilization, the Office of Price Administration, the Civilian Production administration, the Office of Economic Stabilization and the National Wage Stabilization board. Their few remaining functions were for the most part transferred to a newly-created Office of Temporary Controls, headed by the Federal Works administrator.

Priority and allocation powers were in general continued until March 31, 1947, and the allocation of building materials until June 30, 1947, through the extension of the Second War Powers act. Food controls were ended except the rationing of sugar and rice and certain controls exercised by the secretary of agriculture over food production and distribution to permit the allocation of food to famine areas and the equalization of domestic shortages. Construction priorities were assigned to the housing expediter under the Veterans' Emergency Housing act.

The Emergency Price Control act expired on June 30, 1946. The first bill drafted by congress to extend controls was vetoed by the president. After a brief hiatus, during which OPA con-

tinued to exercise some controls under the Second War Powers act, the president on July 29, 1946, signed a redrafted measure extending rent control and limited price control until June 30, 1947, with provisions for the rapid decontrol of prices. By the end of the year all price ceilings were removed except on sugar. On Nov. 9, 1946, all wage and salary controls were also lifted.

The Surplus Property act was amended (1) by designating the department of state as the disposal agency for surplus property outside the continental United States, its territories and possessions and (2) by clarifying the rights of former owners of real property taken by the government for war uses to reacquire such property.

On the last day of the year the president proclaimed that World War II hostilities were ended. This had the effect of terminating 20 emergency laws at once and of setting the expiration date for 15 at the end of 6 months thereafter, for 10 at the end of 1 year and for 8 at the end of periods of more than 1 year. Among the laws immediately stricken from the books were provisions of the Smith-Connally act permitting the government seizure of strike-bound plants and mines. The government's control of facilities already seized might continue, however, for six months from the date of seizure. Numerous other emergency statutes, effective "for the duration of the war" or until "the end of the emergency" remained in force.

Social Security and Health.—Legislation in this field included: (1) amendments to the Railroad Retirement act which increased the tax rate, made changes as to benefits and eliminated certain inequities; (2) amendments to the Social Security act, granting benefits to the dependents of certain deceased World War II veterans, extending unemployment relief coverage to maritime workers, providing additional federal funds for assistance to the aged, to the blind and to dependent children, and freezing the old-age and survivors insurance contribution rate at 1% through the year 1948; (3) the National School Lunch act, which provided for federal grants-in-aid to assist the states in establishing and operating a nonprofit school lunch program; and the National Mental Health act of 1946, which established the National Institute of Mental Health for research and development of more effective methods of preventing mental disease and authorized grants to the states to aid them in similar work. Agitation for extending social security to include health insurance provisions found expression in the Murray-Wagner-Dingell bill, which failed of passage.

Taxation.—The use of "family partnerships" as a means for lessening the impact of income tax rates was limited by the supreme court to situations where both partners actually contribute to the production of the income (*C.I.R. v. Tower*, 327 U.S. 280; *Lusthaus v. C.I.R.*, 327 U.S. 293). In these cases, and in several others involving highly technical distinctions, the supreme court followed its 1943 ruling in the *Dobson* case that it will not review tax court findings of fact; but it reversed a tax court decision that embezzled money must be reported as taxable income, saying that this was a clear-cut mistake of law. The money so taken still belonged to someone else, and was not a gain or profit within the meaning of the revenue laws (*C.I.R. v. Wilcox*, 66 S. Ct. 546).

Conflicts between the taxing powers of the national and state governments were resolved by the supreme court with a view to upholding the authority of both as far as possible. The court sustained the right of Montana to collect licence taxes from liquor stores in Glacier National park; declined to interfere with an Arkansas tax on the severance of timber from federal forest preserves within that state; construed provisions of the Reconstruction Finance corporation act so as to permit a Pennsylvania county to levy real estate taxes on removable machinery in buildings owned by the federal defense plant corporation;

and upheld the right of Minnesota to collect taxes on real estate which was under contract of sale by the federal government to a private buyer who had entered into possession but had not acquired full legal title. But the court ruled that the state of New York was not immune to a federal excise tax on the sale of mineral water from springs owned by the state.

In a unanimous decision the supreme court approved a tax imposed by South Carolina on the gross receipts of foreign insurance companies derived from business in the state. The 1944 decision in the South-Eastern Underwriters' case, that interstate insurance business is subject to federal control under the commerce clause, did not rule out state taxation of this sort. Moreover, the McCarran act of 1945 specifically authorized state regulation and taxation of the insurance business. The supreme court thus in effect validated similar taxes in some 15 states (*Prudential Ins. Co. v. Benjamin*, 66 S. Ct. 1142).

The attempt of Indiana, however, to levy a gross receipts tax on the price received for securities sent out of the state to be sold to residents of other states was an unlawful burden on interstate commerce, according to the supreme court (*Freeman v. Hewit*, 91 L. Ed. 205). So too California exceeded its legal authority in trying to collect a sales tax on oil delivered to foreign tankers for shipment to foreign countries. Such a levy violates the constitutional ban against imposts on exports (*Richfield Oil Co. v. State Board*, 91 L. Ed. 123).

Torts.—By the passage of the Tort Claims act, as title iv of the Legislative Reorganization act of 1946, congress at last waived the government's immunity from liability for the wrongful acts and omissions of its agents and employees. Compensation for such claims could formerly be obtained only through special appropriations by private acts of congress. The new law authorizes the heads of government agencies to settle tort claims in amounts up to \$1,000 and permits suit to be brought against the government in the federal district courts on larger claims.

Veterans.—In a 6 to 1 decision the supreme court rejected the "super-seniority doctrine," promulgated by the director of selective service, that a veteran has an absolute right to re-employment at his old job or one of like seniority, status and pay, even though this may force the displacement of an employee with greater seniority who had not seen war service. All that the statute guarantees is that the veteran "steps back on the seniority escalator at the precise point he would have occupied had he kept his position continuously during the war," said the court (*Fishgold v. Sullivan D. and R. Co.*, 66 S. Ct. 1105).

Congress passed several enactments designed to extend aid to veterans of the armed services and merchant marine in re-establishing themselves in civilian life and to provide medical care and equipment for those who were disabled. Educational grants and allowances were increased; insurance privileges were liberalized; and an effort was made to relieve the housing problem through the Veterans' Emergency Housing act. This law created the Office of Housing Expediter with authority to allocate housing materials under priorities for veterans, establish price ceilings on new houses, make incentive payments to stimulate production of materials, authorize Federal Housing administration insurance on loans for veterans' housing and guarantee markets on new types of building materials and fabricated houses. (M. DN.)

Great Britain, Commonwealth and Europe.—All British and European countries were involved in two types of legislative developments during 1946 arising naturally out of the cessation of hostilities. The first of these was of a transitional nature and included provisions for the punishment of collaborators, the regulation of currency and trade pending a full return to normal conditions and a sorting out of emergency legislation (some of which was revoked while the rest became permanent). In countries overrun by axis forces during World War II new electoral laws and new constitutions were also established. The second type was truly international and progressive and included the establishment of the Court of International Justice at The Hague (which continued under the United Nations the functions of the Permanent Court of International Justice under the League of Nations, with merely incidental changes), and the establishment of an international court (which first sat at Nuernberg) to try war crimes. (See INTERNATIONAL LAW; WAR CRIMES.)

Great Britain.—The lord chancellor, Lord William Jowitt, faced with an alarming increase in the number of divorces awaiting hearing and of applicants for divorce who could not afford the cost (about £60) of a divorce obtained in the usual way through a solicitor, brought into the public service as divorce judges the county court judges throughout England and a large number of king's counsel and other distinguished barristers in London, and so increased the courts trying divorce cases from 8 to more than 60; he also added to the staff of solicitors paid out of public funds who dealt with poor persons' cases, and instead of 8 in London there were by the end of the year 34 spread out all over England. He appointed a committee on procedure in matrimonial causes

of which Mr. Justice Alfred Denning, a king's bench division judge who had been a divorce judge, was chairman. The Denning committee made sweeping recommendations which in Dec. were still under consideration by the government; but the most important one was adopted and the period of waiting between trial and pronouncement of final decree was shortened from six months to six weeks in October. This alone allowed the completion of hundreds of divorce cases then outstanding.

The lord chief justice, Lord Rayner Goddard, carried through a similar speeding up of trials on the common law and criminal side. He had commissioners with judges' powers appointed all over the country and reduced the delay in bringing cases before the courts to such time only as was necessary for the parties or the director of public prosecutions to have their cases adequately prepared for hearing. He also gave several interesting decisions; in motoring cases he ruled that licences must always be suspended in cases of dangerous driving unless the cause of the dangerous driving was directly connected with some such emergency as a doctor hurrying to a patient in an urgent case; reasons such as that the driver earned his living by driving, which had before been taken as permitting a relaxation of the rule that licences should be generally suspended for such an offense, were no longer sufficient. In criminal appeals, as president of the court of criminal appeal, he often increased sentences on appeal and made it unwise to lodge an appeal in a criminal case without sound reasons and proof that a miscarriage of justice had occurred. The much-publicized Harold Laski libel case was the first after World War II in which a special jury was empanelled and resulted in an important vindication of the right of a newspaper to report political heckling at election meetings, and in the government's decision to review the whole question of the proper qualifications for special and common jury service. Common juries, which during the war had been rare, came back into more general use.

A Bank of England act passed in Feb. 1946 made the bank a department of the treasury and so brought it under national control; but this change was mainly formal, as the bank, although technically independent, had been indirectly controlled by the government for many years. Coal was taken over by the state under a National Coal act passed in July and a board established to work coal, develop mining and control prices. Dock labourers, who formerly had not known whether they would be working on any particular day or not, were brought under dock workers' employment schemes by a new law at national expense. An Education act of May 1946 enlarged considerably the state-controlled schools and provided for temporary state assistance to voluntary schools. State-controlled schools were also authorized to provide clothing for their pupils in cases of real need.

Various attempts were made to alleviate the housing shortage; a procedure was enacted for acquiring land for houses, with a speedier variation in urgent cases, and the power to extinguish rights of way; increases and extensions were made in the state grants available; and tribunals were set up to keep the rents of furnished houses down. Shortage of furnished accommodation had resulted in excessive rents, particularly in the more thickly populated areas, and to these tribunals rents for furnished accommodation were referred. The tribunals could alter the rents and register them locally, after which it was an offense to receive a rent above that registered.

An insurance code was passed which required eventually compulsory insurance for all. Insurance companies carrying on most forms of business were compelled by law to have a larger margin of solvency or excess of assets over all possible liabilities after they had been in operation for two years, but were freed from depositing a large sum as before. Procedure for accounting was also laid down. Land was authorized to be taken over by the state instead of death duties and a national land fund started to acquire land for the state.

Legislation, which during the war years had been effected by acts, orders, rules and regulations over a wide variety of subjects, was revised; some of it was revoked, some extended on a temporary basis and some enacted as part of the permanent law. In addition all orders, rules and regulations which had the effect of law had to be printed, numbered, published and made available to the public in the same way as acts of parliament, and the procedure for their sanction or annulment by parliament was laid down. Litigation was made quicker by the use of special commissioners with the powers of high court judges on a lavish scale to supplement the judges.

A post office law provided for expenditure of £50,000,000 on postal and telephonic development. Agricultural legislation provided for the establishment of a national centre for research and the supply of material for artificial insemination of livestock, and for the extension of state grants for plowing grasslands and to hill farmers. A code of water supply law for Scotland was enacted and the secretary of state for Scotland was given the duty of promoting the conservation and ensuring the supply of water and of undertaking research, with the assistance of a large number of local bodies.

Trade unions were freed from the provisions of the Trades Disputes act, 1927; the result of this was that members of trades unions instead of contributing to the unions' political fund only if they agreed to do so, had to contribute unless they notified their union that they did not wish to do so.

Treason against the British state was held on an appeal to the supreme criminal tribunal, the house of lords, to have been committed by a U.S. citizen who had broadcast for the Germans in World War II and had been issued with a British passport; he was hanged. This decision, although in form a declaration of existing law, went beyond previously decided cases and had the appearance of being an extension.

The United Nations were recognized as an authority entitled to call on the government to take any steps short of actual warfare, by an act which provided that orders could be made to enforce any such requirements of the Security Council. Diplomatic privileges were extended to United Nations' personnel.

The Commonwealth.—In Canada three provinces enacted that appeals, instead of going eventually to the judicial committee of the privy council in London, were not to go beyond the supreme court of Canada, which had before been the penultimate tribunal. Under the Canadian constitution such statutes were liable to be declared unconstitutional (and so

invalid) by the judicial committee or in some cases to be overruled by acts of the dominion parliament. The validity of these laws was not established by Dec. 1946.

In Ceylon the establishment of town councils was enacted to undertake local government.

Cyprus, used as a control centre for the temporary accommodation of illegal immigrants to Palestine, was involved in litigation in the British high court in Palestine when habeas corpus applications to prevent removals to Cyprus from Palestinian ports were dismissed. An ordinance provided a procedure for the governor to proclaim persons charged with murder or manslaughter to be outlaws, after judicial investigation and report; this ordinance was limited to one year and loss of all rights followed outlawry.

India had legislative changes; an act was passed to allow all members of the vice-regal council to be independent Indians in place of the previous law under which three members were servants of the British crown in India; another act allowed the central government to exercise powers which before had been reserved to provincial legislatures provided that the viceroy had previously consented to the introduction of all legislation under these powers. Inside India the Nizam of the progressive state of Hyderabad granted a constitutional government by providing that more than 60% of the members of the legislature should be elected; an interesting feature was the arrangement by which any candidate receiving 51% of the votes of his own religious community was elected first; candidates receiving less than 51% of the votes of their own communities only were affected by the total number of votes received.

The Union of South Africa unsuccessfully endeavoured to obtain international legislation by the United Nations to incorporate South-West Africa into the union. Domestic legislation restricted the rights of Indians settled in the union.

Europe.—Czechoslovakia added to its existing laws against "unreliable persons," the effect of which was that Germans, Magyars or persons who had shown sympathy with these nationals were forbidden to take part in the majority of industries (nationalized the previous year) or to occupy positions of importance. A later decree provided for the levying of two taxes: an increment duty on the increase in value of nearly everything between Jan. 1, 1939, and Nov. 15, 1945; and a tax on capital values at Nov. 15, 1945. These taxes provided for a value below which tax was not payable and a sliding scale rising in the case of the increment duty to 100% on values of more than \$9,300 (465,000 Czech crowns); and in the case of the capital tax to 30% on values of more than \$400,000 (20,000,000 Czech crowns).

France spent all its legislative energy on electoral and constitutional development; it succeeded by the end of the year in deciding on a constitution.

Germany under divided rule began to elect its own legislative representatives in certain districts from its own population, but wholly subject to the occupation authorities.

Greece after a referendum again became a monarchy. Laws included one providing harsh penalties on any person unlawfully possessing or dealing with any article belonging to the Allied forces. This was aimed at suppression of rebellions.

The Netherlands imposed strict currency laws on Dutch subjects inside Holland, the effect of which was to restrict the spending of individuals to their earnings, except in special circumstances: the laws were successful in restricting unnecessary expenditure without imposing hardships on individuals.

Norway's laws were chiefly directed to dealing severely with collaborators and to increasing the pensions granted to persons who fought for the nation: merchant seamen, hitherto practically excluded from these benefits, were granted rights comparable to naval personnel. In addition to funds provided under the law, voluntary contributions subscribed on a nation-wide scale were administered with the national funds. The working and living conditions of serving merchant seamen were also improved and much higher standards applied by law. Coastwise shipping, taken out of the hands of individuals and nationalized by law, was brought into line with other nationalized transport services.

Poland's legislation consisted mainly of nationalization and provided for state control of all industrial undertakings "capable of employing more than 50 persons on one shift" except builders and contractors, and concerns already owned by co-operatives or municipalities. Compensation was payable unless the concerns were previously German-owned. Legal procedure was evolved by which concerns were scheduled and decisions were taken as to whether they were to be permitted to remain in private hands or not by the end of the year. In appropriate cases the national or provincial commission might authorize undertakings to remain in private hands if it were in the interest of the state, or allow new private enterprises to begin. The laws provided for the procedure of taking over and for state guardianship committees to administer undertakings liable to be taken over pending decisions. Persecuted persons counted as Polish nationals, and those who tried to escape to German-occupied Poland as Germans.

A further law provided for sequestration of all German- or Gdansk-owned property (which became state property) including property previously German or Gdansk which had been bought by Poles. Property abandoned during the war reverted to its prewar owner if claimed within periods ranging from 5 to 20 years. Temporary state trusteeship was enforced on property believed to come within this law.

Another law provided that material salvaged from damaged buildings became the property of the state and that the buildings repaired became state property for a period not exceeding ten years during which the person entitled to eventual ownership paid rent to cover the cost of repairs: at the end of ten years (or earlier if he had repaid the state expenditure in full) the tenant became the full owner.

Turkey passed laws regulating importation, which had the effect of an import licensing system; their object was to make the best use in the national interest of available foreign currency.

U.S.S.R. legal and legislative changes were manifested in the neighbouring countries (for example by the nationalization laws in Poland) rather than by internal legal developments; the laws of inheritance were, however, revised.

Yugoslavia enacted laws compelling registration with the government of stocks and shares; the issue of bearer shares, the holding of shares by nominees and transfer of shares without government permission became illegal. War profits were forfeited to the state by another law, with severe penalties for nondisclosure. Legislation also effected the nationalization of important industries (including coal, gasoline, mining, electricity, chemicals, textiles, sugar, oil, timber, glass, paper and agricultural seeds); and introduced state control for three years of all property abandoned during the war (which had reverted to its prewar owners by a law of 1945) with a new provision that such property should not be returned at all if it were "in the state interest" to retain it under public control. The effect of this legislation was to penalize or possibly even expropriate foreign investors. (See also AGRICULTURE; BANKING; BUSINESS REVIEW; CONSUMER CREDIT; PATENTS; PUBLIC UTILITIES; RELIEF; TAXATION.) (A. L. C.)

Lawn Tennis: see TENNIS.

Lawrence, Sir Geoffrey (1880—), British jurist, was born Dec. 2, the son of the 1st Baron Trevethin (Sir Alfred Tristram), lord chief justice of England. He studied at Haileybury and at New college. Oxford, and was admitted to the bar at the Inner Temple in 1906, where he worked under Sir John Simon. During World War I, he served as second lieutenant with the field artillery in France, Palestine and Gallipoli, was wounded and received the distinguished service order. In the postwar years his legal practice was made up chiefly of cases from the dominions and colonies presented before the privy council's judicial committee. He became judge of the high court of justice of the king's bench division (1932), master of the bench of the inner temple, lord justice of appeal (1944) and privy councillor (1944). On Sept. 28, 1945, he was named senior British member of the international military tribunal at Nuernberg to try nazi criminals and was later named chairman and presiding judge of the tribunal. Justice Lawrence intervened in the trial after Hermann Goering concluded his testimony (March 22, 1946) with a statement that he would not tolerate any more speech-making in defense of naziism. He was among the four justices who handed down the verdicts in the trials, Oct. 1, 1946. On Dec. 31, Justice Lawrence was elevated to the peerage.

Lead. The wartime gaps in the world production table had been nearly all filled in by the end of 1946, but world totals were still lacking for 1944 and 1945.

Table I.—World Smelter Production of Lead, 1939–45

	(Thousands of short tons)					
	1939	1940	1941	1942	1943	1944
Australia . . .	297.1	211.8	239.1	231.8	202.3	173.1
Belgium . . .	108.3	34.9	9.8	17.9	8.8	8.5
Burma . . .	86.7	89.0	82.1	—	—	—
Canada . . .	190.6	220.1	228.0	243.3	223.9	142.6
Germany . . .	204.7	193.2	190.5	164.1	186.5	165.5
Mexico . . .	235.5	211.6	166.6	212.7	234.2	196.5
U.S.S.R. . . .	82.5	82.7	9	110	139	9
United States . .	445.6	516.6	544.7	548.8	469.5	464.6
Total (est.) . .	1,945	1,890	1,860	1,810	1,690	?

It is to be noted that in the countries reported production decreased 13% in 1944, but increased 3% in 1945. Appreciable improvement was made in 1945 in Mexico and Canada, and to a minor degree in Australia, but part of these increases was offset by the decrease in the United States.

Table II.—Data of Lead Industry in the U.S., 1939–45

	(Thousands of short tons)					
	1939	1940	1941	1942	1943	1944
Mine output . .	414.0	457.4	461.4	496.2	453.3	416.9
Refinery output .	484.0	533.2	571.0	566.8	469.6	464.8
Domestic ores .	421.0	433.1	470.5	467.4	406.5	394.4
Foreign ores . .	63.0	100.1	100.5	99.5	63.1	70.3
Imports . . .	86.9	282.5	381.2	492.5	319.1	319.7

Consumption . .	667	782	1,050	1,043	1,113	1,119
Stocks, year-end						
Producers . .	148.1	143.4	100.1	117.2	129.5	125.1
Consumers . .	?	78.5	101.0	81.7	115.2	84.9
Government . .	—	—	—	248.4	173.9	90.5

While the refinery output dropped 4% in 1945, mine output declined 6%, beginning in May and continuing into 1946. Mine

output for the first ten months of 1946 was 244,800 tons, or a rate of 329,760 tons for the year, a drop of 15% from the 1945 average rate.

Canada.—Mine production for the first three quarters of 1946 was 139,236 short tons, an advance of 13% over the same period of 1945, following a 14% increase in 1945 and 1944.

Mexico.—Production in Mexico declined sharply in 1946; refinery output in the first three quarters was 124,595 short tons, against 224,925 tons in 1945.

Australia.—Refinery production was 113,477 short tons in the first three quarters of 1946, as compared with 174,552 tons in 1945. (See also MINERAL AND METAL PRODUCTION AND PRICES.) (G. A. Ro.)

League of Arab States: see ARAB LEAGUE.

League of Nations. The 21st and last assembly of the League of Nations met at Geneva, Switzerland, from April 8 to 18, 1946. C. Hambro of Norway, president of the 20th assembly, Dec. 1939, was chosen president by the 31 states represented. The assembly met to receive the report of acting Secretary General Sean Lester on the work of the League during and in spite of the war; to provide for the transfer to the United Nations organization (U.N.O.) of all the League's assets, together with such functions of the League as U.N.O. had already agreed to assume, and to dissolve the League of Nations.

The early part of the assembly, the debate on the report, was largely valedictory: praise for the League's high achievement, realization of its weaknesses and hopes for the future of international co-operation. The general conviction was that, now that U.N.O. was endowed with "teeth," it was better suited to the central task of preventing war.

Special interest was shown in the future of mandates and of the technical and administrative work of the League, which, under the charter name of "specialized agencies," were in various stages of being transferred to the control of the economic and social council of U.N.O. The traffic in drugs, never more likely to be a menace than after a world war, was in the hands of a permanent U.N. commission. The League's health organization was expanded and centralized under a new body, the World Health organization (W.H.O.), which at New York, with an all-time record of attendance of 71 states, adopted the first World Health charter. Intellectual co-operation had grown

DELEGATES AND OFFICIALS of the League of Nations bidding each other good-by after the league had voted itself out of existence at Geneva, Switzerland, on April 18, 1946

up into the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.) in Paris, with its wide-flung aims for changing the human mind and enlarging its defenses against war.

The International Labour organization, stalwart survivor of the years between the wars, continued, with at least two successful conferences to its credit. Special agreements already existed between U.N.O. and I.L.O., U.N.E.S.C.O. and the new International Refugee organization (I.R.O.) which took over the whole refugee problem, under ultimate control of U.N.O. Others were to follow.

The League's work for nutrition, which made the world "nutrition-conscious," was magnified in the Food and Agriculture organization (F.A.O.), with its master plan for a World Food board. The League court at The Hague survived under the new name of The International Court of Justice, with judges and rules ready for the first cases.

By a "common plan," which U.N.O. accepted early in the year, all League assets, secretariat and assembly buildings at Geneva, real estate, furniture and so on, were handed over to U.N.O., under an expert board of liquidators. Finally, a formal resolution was adopted, that "from the day following the close of the present assembly the League of Nations shall cease to exist." So ended the first great experiment in international endeavour for peace and human progress. (See also DRUGS AND DRUG TRAFFIC; MANDATES; UNITED NATIONS [U.N.])

(M. FE.)

League of Women Voters of the United States: see SOCIETIES AND ASSOCIATIONS.

Leahy, William Daniel (1875–), U.S. naval officer, was born at Hampton, Ia., on May 6. He was graduated from the U.S. naval academy, Annapolis, Md., in 1897. He was commissioned vice-admiral in 1935 and admiral in 1936. In Nov. 1940, President Franklin D. Roosevelt named him ambassador to the French government at Vichy. In April 1942, Roosevelt summoned Leahy to Washington where, on July 21 he became chief of staff to the commander in chief. In this capacity he accompanied the president to the international conferences held during 1943 at Quebec, Cairo and Tehran. In Dec. 1944 Admiral Leahy was promoted to the five-star rank of admiral of the fleet. He accompanied President Harry S. Truman to Berlin for the Potsdam parley (July-Aug. 1945).

Leahy was appointed by Pres. Truman, March 28, 1946, to a special 10-man national defense board composed of top leaders of the armed services. He went to London in the spring of 1946 for discussion of "mutual" problems with British chiefs of staff and declared (May 17) that Britain and the U.S. would agree on common use of their Pacific bases. It was generally believed that the president leaned heavily on Leahy in the shaping of foreign policy in 1946 and that the admiral was a leading advocate of a "firm policy" toward the U.S.S.R.

"Lend-Lease" Act (H.R. 1776): see LEND-LEASE.

Leather. The leather production outlook early in 1946 was generally favourable, and many in the leather industry predicted a general trend toward an improved production situation as the year progressed. Production was well maintained during the first half of the year, but it nose-dived in the third quarter because of the meat production lag. It regained some lost ground towards the end of the year, but the outlook for 1947 was not wholly satisfactory to tanners, and not entirely clear.

Table I.—Average U.S. Monthly Leather Production, 1942-46

Average monthly production of the principal types of leather in 1946 is shown in the following table, with comparison of average monthly output for the preceding four years.

	Average Monthly Production				
	1946	1945	1944	1943	1942
All cattlehides (including kips for side leather)	2,569	2,297	2,179	2,136	2,569
Sole (sides)	1,739	1,421	1,403	1,382	1,739
Belt and mechanical (butts)	100	110	120	108	100
Side upper and patent (sides)	2,600	2,428	2,167	2,179	2,600
Bag, case and strap (sides)	156	95	105	133	156
All other (hides)	221	215	221	183	221
Calf and whole kip	1,022	970	911	926	1,022
Goat and kid	3,427	2,002	2,888	3,113	3,427
Cabretta	280	368	298	285	280
Sheep and lamb (excl. shearlings)	3,669	3,828	4,050	4,057	3,669
All sheep and lamb	4,028	4,370	4,608	4,991	4,469

Raw stock supplies for the year as a whole were far below normal, and were gleaned from so many sources that at the end of the year no reliable statistics showing the actual decline in supply could be compiled. With the shrinkage of U.S. raw stock supplies, there was also a continuance of a corresponding shrinkage in raw stock imports, a shrinkage that by the end of the year had become alarming.

On the vital question of imported hide and skin supplies, Julius G. Schnitzer, chief of the textile and leather division of the department of commerce, reported in Nov. 1946 that: "Current reports indicate a world-wide increase in the demand for meat, so that world hide and skin supplies may be higher than in prewar years." He observed that prospects for hide importations in 1947 were relatively favourable, with probable imports of 1,500,000 hides. The outlook for larger importations of calfskins was not so bright, the report continued, particularly in the case of goat and kid skins.

During 1946, the U.S. department of commerce had been compiling such information as was available on world developments by countries. While the total area of world raw stock and leather production had not yet been satisfactorily covered, it was apparent that tanning activity abroad expanded generally during World War II. There was much pressure in many countries that were formerly important sources of raw stock for the U.S. leather industry to reduce exports of raw stocks from those countries, convert the stocks into finished leather and leather goods domestically and distribute them domestically or cultivate export markets. The trend in this direction was plainly visible at the end of 1946. The cumulative reports were far from complete, but were highly significant.

Supplies of important tanning materials were somewhat erratic through 1946, and there were some serious shortages, notably in chestnut extract, chromium, caustic soda and corn sugar. At the end of the year some of the shortages were easing slightly, but it was felt that the chestnut extract problem could be solved only by the successful development of blight-resistant domestic chestnut to provide new sources of supply.

Many of the wartime controls over the leather industry remained in effect until late in the year, with numerous changes and amendments, most of which were of an administrative nature or were adjustments to changing conditions. By the end of 1946, practically all of those controls had been removed, and for the first time in years, the leather industry was "on its own."

The industry's principal peacetime problem was becoming apparent—competition from substitute materials of many kinds. Many of those materials were widely used during shoe rationing and had become well established in volume shoe markets. With shoe manufacturers experiencing difficulty in obtaining leather to make record pairage production, the threat of substitutes increased substantially, despite a clear consumer preference for leather.

The following table shows the trend toward increased use of substitute materials for shoe soles, a trend that was definitely accelerated during 1946.

Table II.—Estimated Percentage of Leather and Non-leather Sales in Shoe Production

	1940		1941		1942		1943		1944		1945	
	Leather	Other	Leather	Other	Leather	Other	Leather	Other	Leather	Other	Leather	Other
Men's dress	83.8	16.2	86.1	13.9	91.6	8.4	81.7	18.3	77.2	22.8	74.2	25.8
Men's work	43.3	56.7	49.2	50.8	57.3	42.7	33.7	66.3	36.8	63.2	43.0	57.0
Women's	82.3	17.7	85.8	14.2	88.4	11.6	74.1	25.9	78.9	21.1	4.4	95.6
Youths' and boys'	42.9	57.1	43.7	56.3	52.1	47.9	37.1	62.9	29.7	70.3	36.5	63.5
Misses' and children's	76.2	23.8	77.3	22.7	81.4	18.6	69.3	30.7	69.0	31.0	54.5	45.5
All civilian types	73.3	26.7	75.5	24.5	83.3	16.7	69.6	30.4	54.8	45.2	56.9	43.1

There was considerable progress in research and technological study by the leather industry in 1946. The subject of tanning machinery and equipment was given more attention than in prior years, although it still lagged in actual progress far behind scientific developments in leather making.

An industry report, commenting on this lag, stated that to a large extent the answer might be found in the average asset life of tannery equipment and the relatively limited market for innovations. In addition, traditional practice and the capital cost of new equipment had been deterrents to change. Finally, the report states, in an industry where raw material constitutes so large a proportion of total costs, the importance of technological change tends to be subordinated to the apparently more important element of market fluctuation.

Increased attention was given in 1946 by the Civilian Production administration and other federal agencies to the Florida scrub oak project. This project was initiated by the University of Florida experimental station, with a view to producing both tanning extract and pulp in substantial quantities. According to estimates based on scrub oak resources in Florida, it was calculated that 6,000,000 tan units per month could be made available over a period of 20 years.

According to a soviet news bulletin, a rapid vegetable tanning process had been developed by Russian scientists. It was reported that this achievement had resulted in methods which cut tanning time to one-sixth of the time previously required.

The Tanners Research laboratory reported on a study of quebracho tanning material on calfskin squares. The earlier work by Robert M. Lollar on the take-up of quebracho tannin by hide powder was extended to include the fixation of the tannin by hide substance in the form of calfskin squares. Raising the pH of tannage from 4.0 through 4.8 to 6.0 lowers the fixation progressively. At all three pH levels, the tannin fixed as determined by A.L.C.A. analyses of the leather is related to the equilibrium solution analyses for free tannin in such proportions that rectification by the method developed by Langmuir can be successfully applied to the data, thus suggesting sorptive phenomena. This work has only limited immediate application, but it is part of the fundamental problem of the mechanism of tanning. (See also SHOE INDUSTRY.) (R. B. B.)

Lebanon: see SYRIA AND LEBANON.

Leeward Islands. A British crown colony and archipelago forming the northern part of the Lesser Antilles in the Caribbean; some of the Leeward Islands are United States, Dutch and French possessions. British islands in the Leeward group are organized politically in four presidencies. They are: Antigua (including Barbuda, 62 sq.mi., and Redonda), area, 170.5 sq.mi., pop. (1946 census), 41,826; Montserrat, area, 32.5 sq.mi., pop. (1946 census), 14,275; St. Kitts-Nevis (including St. Christopher, 68 sq.mi., Nevis 50 sq.mi., and Anguilla, 34 sq.mi.), area, 152 sq.mi., pop. (1946 census), 46,206; and the (British) Virgin Islands, area, 67 sq.mi., pop. (1946 census), 6,505. Total area, 422 sq.mi.; total pop., 108,812. Racial composition is more than 75% Negro. The four units are governmentally federated. The capital of the colony and of Antigua is St. John's (pop. est., 10,000); the capitals of Montserrat, St. Kitts-Nevis and the Virgin Islands are, respec-

tively, Plymouth (pop. est., 1,893), Basseterre (pop., 1943 census, 19,895), and Road Town (pop. est., 900). Governor in 1946: L. B. Freeston.

History.—The Leeward Islands were concerned primarily

during 1946 with the possibility of political federation with other British colonies. Police and judicial services were already operated jointly by the Leeward and Windward colonies. A preliminary agreement for union of the two groups was reached early in 1946, with the possible capital to be on Grenada in the Windwards; proposals were also made for functional federation of services with Barbados, British Guiana and Trinidad. Representatives from the Leewards attended the civil aviation conference held on Trinidad beginning June 1. Legislative elections held on Antigua and St. Kitts-Nevis at the end of July resulted in general victories for the Labour party candidates.

Education.—Under the terms of the second British colonial development and welfare act, passed in 1945, a free grant of £200,000 was made early in 1946 for construction of school buildings in the Leeward Islands. The colony was also concerned with plans for a new teacher training college in Trinidad, to serve that island and the Leewards and Windwards.

Finance.—The monetary unit is the West Indian or Trinidad dollar, equivalent to 4s. 2d. and exchanging for approximately 84 cents U.S. The Leeward colony sent delegates to the West Indian currency conference held in Barbados beginning May 13. Sentiment in the colony concurred in the conference recommendation of a decimal currency based on the West Indian dollar. Allocations of £278,860 were made by the British government early in 1946 to the Leeward Islands under the colonial development and welfare act of 1945; other grants totalled £190,136.

Communication.—British West Indian Airways provided weekly plane service to St. Kitts and Antigua. Local plane service was begun during 1946 to connect Nevis with the Windward Islands and Trinidad. Antigua was the location of one of four United States-leased air bases opened to civilian aviation in 1946.

Agriculture.—The 1946 sugar crop on St. Kitts and Antigua, respectively, was 33,513 and 26,022 long tons. Cotton production in 1946 on St. Kitts and Nevis, respectively, was 120,000 and 250,000 lbs.

Lend-Lease. The Lend-Lease act, which expired for most purposes on June 30, 1946, after having been extended three times, was enacted by congress as a U.S. defense measure on March 11, 1941, at a time when the nazis had subjugated most of Europe and threatened the remaining democracies of the world. Lend-lease became the great allied supply system by which more than \$50,000,000,000 worth of U.S. goods and services were furnished to countries fighting the axis. The termination of the lend-lease program began promptly with the formal ending of World War II.

Under the termination program, "straight" lend-lease, which in general was the granting of aid in goods and services without specific agreement for payment, was discontinued as of V-J day, with the exception of aid to China and certain other minor

cases. Aid to China was continued by the direction of the President to enable the national government of the republic of China to disarm and take into custody for repatriation the millions of Japanese in China and thereby re-establish Chinese sovereignty over the vast areas of its territory that had been under Japanese domination. The continuance of lend-lease aid to China, which by agreement was being provided on a reimbursable basis after June 30, 1946, also enabled the Chinese to participate in the occupation of Japan.

With the capitulation of Japan two other important steps were taken in lend-lease affairs, in addition to the termination program. Arrangements were made with foreign countries for the disposal to them of lend-lease goods which were in inventory or in the process of procurement as of V-J day and, secondly, the negotiation of final settlement agreements covering lend-lease aid from the beginning of the program was begun with foreign governments.

Lend-lease goods in inventory or procurement as of V-J day were termed pipe-line goods. Since most of the pipe-line items were manufactured to foreign specifications and consequently had little postwar civilian value in the U.S. market, the U.S. government notified foreign countries that these materials would be available for delivery to them upon reasonable credit payment terms. As a result, pipe-line sale agreements were negotiated with 13 countries, with total sales amounting to about \$1,200,000,000. By the end of 1946 substantially all the supplies in the pipe-line had been shipped. Under the Lend-Lease act the powers of the president to carry out contracts or agreements made with foreign governments prior to July 1, 1946, were continued until July 1, 1949.

In negotiating the final lend-lease settlement agreements certain broad principles were generally applied. These principles provide that the United States and the foreign countries each pay for and receive full title to lend-lease and reverse lend-

lease articles of postwar civilian utility which were in their respective possessions as of V-J day, while military items remain in the possession of the recipient governments, without payment, but subject to a right of recapture. In most instances lend-lease goods supplied by the United States to its allies and consumed in the prosecution of the war were furnished without payment by the foreign governments. Some of the settlement agreements also covered the sale to foreign countries of surplus U.S. army and navy articles and all the agreements that were negotiated to the end of 1946 contained provisions for the settlement of outstanding claims between the United States and the foreign governments which arose as a result of the war.

By Dec. 31, 1946, final lend-lease settlement agreements had been concluded with the United Kingdom, France, Belgium, Turkey, Australia, New Zealand and India. The final agreement with the United Kingdom, which received by far the greatest amount of lend-lease aid, was signed on Dec. 6, 1945, and provided for the payment to the United States of \$650,000,000 for the settlement of lend-lease and reverse lend-lease and for the acquisition of U.S. surplus property and interest in installations in the British Isles. Under the lend-lease agreement signed on May 28, 1946, France was to pay the United States \$420,000,000. The Belgian and U.S. lend-lease and reverse lend-lease accounts were in approximate balance and in the agreement concluded at Washington on Sept. 24, 1946, no payment was required by either government. The settlement with Turkey, signed on May 7, 1946, specified a cash payment by Turkey of \$4,500,000. The Australian agreement, which included the purchase of U.S. surplus property, was concluded on June 7, 1946, and resulted in an obligation to the United States of \$27,000,000, of which \$20,000,000 was paid in cash. A lend-lease agree-

PHOTOGRAPH RELEASED by the U.S. navy in 1946 shows U.S. sailors launching a navy Catalina plane at Women's bay, Kodiak, Alaska, after its delivery to the Russians for ferrying. It was disclosed that 188 of these planes, as well as Norden bombsights and the latest types of radio and radar gear, were sent to Russia under lend-lease during 1944 and 1945

ment with New Zealand was reached on July 10, 1946, and since the obligations for lend-lease and reverse lend-lease offset each other no payment was necessary. In the agreement with India, signed on May 16, 1946, the accounts were also in approximate balance and no payment was required by either country. Since India was largely a military supply base during the war, much of the lend-lease material which the United States shipped to that country was actually for the use of United Kingdom forces or for transfer to China. These final settlement agreements covered 70% of the total lend-lease aid that the United States supplied to its allies after March 11, 1941.

Agreements remaining to be negotiated at the close of 1946 included those with the soviet union, China, Greece, the Netherlands, Norway and the Union of South Africa.

Lend-lease aid from the beginning of the program on March 11, 1941, through Sept. 30, 1946, totalled \$50,692,000,000. Of this total, munitions such as guns, planes, tanks and explosives represented more than 50%. The British empire received 65% of all lend-lease aid; the British empire, the soviet union, France and China accounted for 98% of all aid. In the period from V-J day to Sept. 30, 1946, goods in the pipe-line sold on payment terms, aid to China and other miscellaneous lend-lease charges amounted to \$2,113,000,000. Reverse lend-lease aid to the United States, cumulative from the beginning of the program to V-J day, totalled \$7,820,000,000.

The realization to the United States from payments in the settlement agreements, cash payments for lend-lease goods and services, reverse lend-lease aid and the sale of pipe-line supplies exceeded \$10,000,000,000 by the end of Sept. 1946. The great contribution of lend-lease, however, was its vital and significant role in victory and in the U.S. and allied lives which were saved by speeding the day of the triumph of democracy over fascism. Although the cost of the program to the U.S. people was heavy, lend-lease can never be measured in dollar terms.

After Oct. 20, 1945, the lend-lease program was administered by the department of state. Chester T. Lane as lend-lease administrator was in charge of lend-lease operations. (See also AGRICULTURE.) (C. T. L.)

"Lend-Lease" Act: see LEND-LEASE.

Leprosy. Experimental work on new drugs for leprosy would be greatly facilitated if it were possible to determine their effect on cultures of the acid-fast leprosy bacillus (*Mycobacterium leprae*). Though 74 yr. elapsed from the time Armauer Gerhard Henrik Hansen discovered this organism in material from leprosy patients its growth outside of the body was not satisfactorily demonstrated. Many studying this problem obtained cultures of acid-fast bacilli from leprosy nodules but bacteriologists accepted none as being the leprosy bacillus. From India came an interesting report on another attempt to grow the elusive *Mycobacterium leprae* in tubes containing a culture of *Leishmania donovani*, a flagellate protozoan causing kala-azar. The experiment was suggested to the author after he had observed certain serological features common to the two diseases. Tubes containing an active culture of the protozoan were inoculated with tissue from a leprosy nodule. After a period of two weeks there appeared to be a definite increase in the number of leprosy bacilli. When subcultured on a medium which did not sustain growth of the protozoan small yellow colonies of acid-fast bacilli resulted. In this manner growth was obtained of material from four nodules and no failures reported. Much more work must be done by the author and his methods tried by others before evaluation could be made.

Eye specialists use the slit lamp for direct, minute, in vivo examination of blood vessels and other structures of the eye.

Using this instrument one observer studied the eyes of 1,279 leprosy people. He concluded that data obtained by this method of examination facilitated the classification of the type of disease in his patients.

Emphasis on the frequency of a serious complication of leprosy-occlusion of the larynx by leprosy tissue, was the subject of a report from the Kalaupapa Leprosy settlement, Territory of Hawaii, where 13% of the patients were being kept alive by the use of tracheal tubes.

Encouraging results were reported on the use of promin but this drug could not be well tolerated by mouth and had to be given intravenously. From Carville, La., were reports on the use of sulfone drugs suitable for oral administration. Diasone was tried on 104 patients over a period of two and one-half years. As very little improvement was seen in less than six months, evaluation was made of only those cases receiving it for more than that period. Nearly all cases were of the types in which clinical improvement would not ordinarily be expected. Objective improvement occurred in 65% and in none were lesions considered worse. Toxic reactions prevented approximately 25% from continuing treatment. No opinion was offered on what effect this drug might have on the ultimate outcome of a leprosy case. A preliminary report was made on the effect of a second sulfone drug, promizole. It was given orally to 11 patients. Seven continued treatment for one year with results sufficiently encouraging to warrant further trial when adequate quantities became available.

Lettuce. The U.S. record lettuce crop of 1946 was estimated by the U.S. department of agriculture at 34,504,000 crates compared with 29,767,000 crates produced in 1945 and a 10-yr. average of 22,524,000 crates, 1935-44. The total acreage was 207,980 ac. in 1946 compared with 173,000 ac. in 1945 and 154,270 ac. 1935-44. The average yield was 167 crates per acre, slightly less than the 173 crates of 1945; the 10-yr. average was 146 crates. The winter, spring and summer crops were larger than in any previous year and the fall crop was 23% more than that of a year earlier and 58% more than the average. About 65% of the lettuce crop was produced in California. In 1946 more than 22,000,000 crates of the winter, early spring, summer and fall crops came from the 126,650 ac. devoted to the crop in California. Arizona was a close second with a production of about 6,500,000 crates of the winter and early spring crops. Florida was third for the winter crop and New York led all the eastern states with a production of about 1,000,000 crates of summer crop.

The price of lettuce was generally lower in 1946 than a year earlier during the first half of the year. Prices were higher in August and then declined as shipments increased. Growers' prices of lettuce reached a high of \$3.15 per crate in 1945 and

U.S. Lettuce Production, 1946, 1945 and
Average, 1935-44

(In thousands of crates)

Crop	1946	1945	Average 1935-44
Winter	9,387	7,572	5,360
Early spring	8,391	8,122	6,298
Late spring	1,309	1,025	918
Summer	7,450	6,596	4,933
Fall	7,967	6,452	5,016
Total	34,504	29,767	22,525

averaged \$2.90 for the year; but through 1946 it averaged only \$2.55 per crate. Lettuce shipments by air were the subject of experimental shipments in 1946 with some promise that as air rates were reduced the practice would expand. (See also VEGE-TABLES.) (J. C. Ms.)

Lewis, John Llewellyn (1880—), U.S. labour leader, was born Feb. 12 in Lucas, Ia. After seven years of schooling he was compelled, because of his family's financial need, to desert his studies and enter the mines. Lewis became president of the United Mine Workers of America in 1920, holding the post from then on. He had long favoured industrial organization of open-shop mass production industries, contrary to traditional A.F. of L. craft unionism. In 1935 he formed the Committee for Industrial Organization. When he refused to heed the A.F. of L. executive council's order to dissolve the committee, the participating unions in the C.I.O. were suspended in 1936 and the following year were expelled from A.F. of L. membership.

Lewis supported Franklin D. Roosevelt in 1936, but in 1940 he switched his support to Wendell Willkie and promised to resign as C.I.O. chief if Willkie lost. He made good his promise but retained the U.M.W.A. presidency. In Oct. 1942, he led the mine workers' out of the C.I.O. and after three years of negotiations, his union was finally readmitted to the A.F. of L., Jan. 25, 1946.

He called two major strikes in 1946. The first (April 1–May 29) ended to the mine leader's satisfaction; he signed a government contract (to continue during government operation of the mines) which included an 18½¢-per-hour wage increase and provisions for establishing a miners' "welfare and retirement fund" financed by a levy of five cents per ton of coal produced.

The second strike ended less happily for Lewis. After contract negotiations with Secretary of Interior Julius Krug, Lewis rejected the government's proposal that the miners stay on the job for 30 to 60 days while the talks continued, and he notified the government that the contract had ended. The government contended Lewis had no authority to abrogate the contract; Lewis maintained that he did and the coal miners went out on strike Nov. 21. The government promptly obtained a restraining order from Judge Thomas Goldsborough of the U.S. district court of Columbia requiring Lewis to revoke his contract termination notice. Lewis, who ignored the order as a violation of the Norris-LaGuardia act, was hailed before Justice Goldsborough in Washington for disobeying the government's injunction. Lewis and the U.M.W. were convicted Dec. 3 of civil and criminal contempt; the following day (Dec. 4), Goldsborough fined Lewis personally \$10,000 and the U.M.W. \$3,500,000. Lewis called off the strike Dec. 7 and in a brief filed before the U.S. supreme court, Jan. 11, 1947, Lewis and the U.M.W. accused the government of surrendering to "political expediency" in using the injunction to stop the strike.

Liberal Party. Immediately after the general election of 1945 in Great Britain a committee under the chairmanship of Noel Newsome was appointed to recommend changes in the organization of the party. The report entitled *Coats Off for the Future* was published in March 1946 and for the remainder of the year the party, not only at its headquarters but also throughout its area and constituency organization, was engaged upon a vigorous campaign. The special assembly in May, attended by 1,300 representatives, pledged themselves to the following resolution: "We, Liberal representatives, here assembled, realizing mankind's desperate need of the spirit and practice of Liberalism, dedicate ourselves to the purpose of rebuilding the Liberal party as an effective political force capa-

ble of assuming the government of this country."

A foundation fund was successfully launched; it included a membership scheme on a national basis by which a mass membership at a subscription of threepence per week was being built up. As a receipt for such subscription a four-page Liberal newsheet was supplied to members each week.

During the autumn foundation fund rallies were held throughout the country, at which leading personalities in the party were principal speakers. On March 20 Lt. Col. Frank Byers was appointed chief whip to the parliamentary party on the resignation of T. L. Horabin; Lady Violet Bonham Carter was re-elected as president of the organization. (W. Rs.)

Liberia. This Negro republic lying on the west coast of Africa at the lower curve of the continental bulge, bordering the narrowest part of the South Atlantic bottleneck, is the closest area of Africa to South America. The land (area: 40,000 sq.mi.) was bought in 1820 by the American Colonization society for the purpose of repatriating freed slaves from the United States to the state of their forefathers. England had already established a similar colony on land named Sierra Leone which bounds Liberia on the northwest. Except for Liberia's coastline (350 mi.) the rest of the country is surrounded by French territory: French West Africa and Ivory Coast. It is estimated that of the estimated population of 1,000,000 only 12,000 are descendants of the original colonists from the United States. The remaining majority is comprised of the uncivilized aborigines consisting of 28 tribes speaking as many dialects. The descendants of the U.S. Negroes, known as Americo-Liberians, are the intellectual and ruling class and speak English. The colony declared its independence on July 26, 1847, and adopted a form of government patterned after that of the U.S. The president in 1946, the Hon. William V. S. Tubman, was inaugurated in Jan. 1944 for a term of eight years. Liberia, although officially Protestant Christian, grants religious freedom to all and welcomes all sects to evangelize its peoples.

History.—The United States embarked on a comprehensive program of assistance to develop Liberia's economy and to bring about a betterment of health conditions. Under the supervision of the U.S. navy a port was under construction in 1946 at Monrovia to cost between \$15,000,000 and \$20,000,000 from funds advanced by the U.S. government. In Feb. 1946, the first load of rock was put in place amid colourful ceremonies, and Liberia's first railway connected with the port project was opened when the U.S. minister turned over locomotive and cars to Pres. Tubman. The U.S. Public Health mission, with a staff of 22 coloured Americans and 1,000 Liberian employees, had almost completed its elimination of mosquitoes in Liberia and environs, and was conducting a school of subprofessional members and, under the auspices of the U.S. state department's division of cultural co-operation, also a nursing education mission. In 1946 the Liberian government purchased equipment from the U.S. War Assets administration hospital at a cost of \$85,000. In memory of Harvey S. Firestone, plans were formulated by his heirs to initiate an ambitious health program in Liberia with leading U.S. colleges participating in the foundation's activities. From late in 1944 up to early in 1946 a U.S. economic mission saw service in Liberia. From the fall of 1944 an American officiated as agricultural adviser to the government.

Constitutional amendments were ratified by the electorate in 1946: granting woman suffrage; giving political representation to the hinterland by seating in the house of representatives an aborigine from each province; remodelling election laws designed to ensure fairer elections.

At the request of the Liberian government the U.S. sent a geological mission to Liberia to make a survey of iron deposits

in the Bomi hills. The survey report, submitted in 1945, estimated the reserves of high grade ore at about 5,000,000 long tons and from 75,000,000 to 150,000,000 long tons of milling-grade ore. A U.S. company secured a concession to exploit the Bomi hills area and company representatives were on the scene in 1946.

Education.—In 1946, institutions included 84 government, 81 mission, 11 tribal (supported by aborigines) and 25 private schools. The three largest were: Liberia college, chiefly supported by the government; College of West Africa, which received \$600 yearly from the government; and Booker T. Washington Industrial and Agricultural institute, supported by U.S. philanthropy, and a \$5,000 yearly grant from the government. Substantial sums for education are expended by the Protestant Episcopal Church, American Lutheran Church, American Negro Baptists and Assembly of God. African Methodist Episcopal and A.M.E. Zion Churches and Seventh Day Adventists maintain schools. Compulsory education for children from 6 to 16 is free. A larger educational appropriation was recommended to the legislature for 1947. Forty Liberian students were in the U.S. during 1946, principally on government scholarships.

Finance.—During the ten-year period ending 1944, and also in 1946, Liberia operated under a balanced budget and paid off regular instalments on its bonded and floating debts. Within three years, including 1946, the debt was reduced from \$1,193,000 to \$690,000, and the floating debt from \$76,000 to \$26,000. Government revenues for 1946 approached \$2,000,000. In 1944-45, internal and customs revenues and other collections totalled \$1,897,869.46; the total for the 1945-46 fiscal period was \$2,197,879.19. As regards foreign trade, comparative data showed that exports increased from \$10,420,511 in 1945 to \$12,958,244 in 1946.

Trade and Agriculture.—The Firestone company first planted rubber in Liberia in 1925, and the operation of the company's plantations played an important part in the country's economic progress. Firestone's est. production of 1945 was 41,000,000 lb. and was somewhat larger for 1946. There were more than 100 on the foreign staff, and from 21,000 to 22,000 Liberians on the pay roll. Liberia was one of three countries to supply the Allies with rubber during World War II, and the only country to export latex. Rubber was by a wide margin the chief item of export with gold taking second rank. The country also ships abroad piassava, palm oil, palm kernels and cocoa. The first consignment of wood was sent to Europe in 1946.

Liberty Ships: see SHIPBUILDING; SHIPPING, MERCHANT MARINE.

Libraries. Unquestionably the most serious problems for U.S. libraries in 1946 were those of finance and personnel, the latter closely related to the former. Another problem, that of increased use, was created by the large enrolments in colleges and universities of veterans eager to take advantage of the government's provision for further education. Library facilities were severely taxed, added to which was the inadequate supply of recent, standard books.

Appropriations for tax-supported libraries were very generally increased. Because of the decreasing returns from investments the situation of libraries supported by endowments was becoming increasingly difficult unless new sources of income could be found. In view of the rising cost of living coupled with many staff vacancies, some action was imperative, and it was encouraging to note that many of the larger libraries adopted better salary schedules. These increases, however, together with many cost-of-living bonuses, did little more than offset rising prices. In spite of what had been done in 1944-45, salaries for

trained librarians in 1946 were still distressingly low when compared with other positions requiring like ability and preparation. The American Library association standard of a minimum salary of \$2,100 for beginning professional positions was a modest goal when salaries in business and industry were considered. In fact it would be necessary to increase salary schedules one-third above the 1941 level to meet the increased cost of living.

Although low salaries were perhaps the main cause of the inability to fill many professional positions, another reason for the shortage was the much smaller number of graduates of the accredited training schools from 1941 to 1945. There were in 1946 perhaps 3,500 fewer trained people than there would have been if library school enrolments had merely maintained the point reached in 1940. It was clear that this lack of qualified personnel would handicap libraries for many years, and that at a time when there had seldom been greater need for adequate library service or greater opportunity for library development. Joseph L. Wheeler's excellent report, *Progress & Problems in Education for Librarianship*, prepared for the Carnegie corporation, summarized much of the current discussion about professional training. Recruiting and revision of curricula were matters that received special attention.

The total enrolment (March 1, 1946) in the 36 schools of various types accredited by the board of education for librarianship of the American Library association was 1,547, including 194 advanced and 154 special or nonmatriculated students, an increase of 199 as compared with 1945. Of the total number enrolled, 193 were men and 600 (all matriculated students) were part-time.

Because of rising costs and the continuing shortage of materials, there was practically no library building. Work on the new library at Princeton university was proceeding and tentative plans for the undergraduate library at Harvard, announced in 1945, were prepared and the site determined, but for the most part plans for new buildings or additions to present buildings were in abeyance.

The sorting and distribution of books acquired by the Library of Congress mission, mainly in Germany, France and Italy, was begun, allocation by subjects to the participating libraries being made on the basis of priorities determined by the present strength of their collections, and geographical location. The

MOBILE LIBRARY UNIT of the United States Armed Forces institute was housed in an army truck. Institute staff member counsels two soldiers of the occupation forces in Japan on a selection of some of the 450 educational courses offered by the institute

International Relations office of the American Library association and the recently organized American Book Centre continued their work of distributing books and periodicals needed by scholars to libraries in war areas.

The Linda Hall library, Kansas City, Mo., opened late in 1946 in the remodelled Hall residence, was established by Herbert F. Hall as a memorial to his wife, Linda Hall. Hall died in 1941, and his will provided a trust fund of \$6,000,000 for this purpose. The library was planned as a special scientific and technical collection to meet the needs of the Kansas City area and to supplement existing library resources. The collections of the American Academy of Arts and Sciences of Boston, established in 1780, consisting of more than 62,000 volumes and strong in periodicals, were purchased as the nucleus of the new library.

On Oct. 19 Yale university held a special convocation to mark the return of the university's great collections to peacetime use. On this occasion the honorary degree of Doctor of Humane Letters (L.H.D.) was conferred on four distinguished librarians: Lawrence C. Wroth, Keyes D. Metcalf, Harry M. Lydenberg and Luther H. Evans.

Size of Collections.—The figures for libraries possessing more than 1,000,000 volumes have generally been taken from statistics published by the American Library association. The preparation of these tables was discontinued in 1945. There were 22 libraries containing more than 1,000,000 volumes each, and two "runners-up" (the New York State library, Albany, and the St. Louis Public library) rapidly approaching that mark. These 22 libraries were divided as follows: government libraries 2 (Library of Congress, and Army Medical library); university libraries 11 (Harvard, Yale, Columbia, Illinois, California, Chicago, Minnesota, Michigan, Cornell, Princeton, Pennsylvania); public libraries 9 (New York, Cleveland, Chicago, Boston, Los Angeles, Cincinnati, Brooklyn, Detroit, Carnegie Library of Pittsburgh). The Library of Congress ranked first with more than 7,000,000 volumes. Harvard university (all libraries) and the New York Public library (both reference library, more than 3,000,000 and branch libraries) were nearly equal with just more than 4,500,000 each. Yale stood fourth with nearly 3,400,000 volumes.

Librarians.—Franklin F. Hopper, director of the New York Public library from 1935, retired Oct. 1, and was succeeded by Ralph A. Beals, director of the University of Chicago libraries from 1942 and dean of the university's graduate library school from 1945. Dr. Clarence H. Faust, dean of the college of the University of Chicago from 1941, assumed the deanship of the library school Oct. 11. Wyllis E. Wright, appointed librarian of the reorganized Army Medical library, Washington, D.C., July 1, 1945, resigned late in the year to become librarian of Williams college. Glenn M. Lewis, a member of the staff of the Minneapolis Public library for more than 20 years, was named chief librarian in succession to Carl Vitz now at Cincinnati. Harrison W. Craver, director of the Engineering Societies library, New York city, from 1917, retired and was succeeded by Ralph H. Phelps. Craver organized the technology department of the Carnegie Library of Pittsburgh in 1900, and was appointed librarian in 1908. He was a pioneer in this specialized field of librarianship, and was president of the American library association in 1937–38. Dr. Otto Kinkeldey, distinguished musicologist, retired from the librarianship of Cornell university and was succeeded by Stephen A. McCarthy.

Benjamin E. Powell, librarian of the University of Missouri for ten years, returned to Duke university as director of libraries, having previously served on the Duke staff in various capacities. Francis R. St. John, chief of the circulation department of the New York Public library, resigned at the end of the year to become director of the Veterans' administration libraries.

Charles H. Brown, president of the American Library association in 1941–42, and librarian of the Iowa State college at Ames, retired July 1 and was succeeded by Robert W. Orr. Jerrold Orne, formerly at Knox college, was appointed director of libraries at Washington university, St. Louis, Sept. 1. Kenneth R. Shaffer was appointed director of the School of Library Science at Simmons college, Boston, and J. Periam Danton succeeded Sydney B. Mitchell as director of the School of Librarianship at the University of California.

Harry M. Lydenberg retired Sept. 30 as director of the International Relations office, Washington, of the American Library association, a post he had filled with distinction and energy from 1943. Of particular interest was the appointment in August of S. Hartz Rasmussen as librarian of the United Nations at New York. Rasmussen, born and educated in Denmark, received his professional training at the Columbia university library school, was head of the reference department of the Frederiksberg public libraries in Copenhagen and, after 1931, in charge of departments of the library of the League of Nations, first at Geneva and later at Princeton. (See also AMERICAN LIBRARY ASSOCIATION; SOCIETIES AND ASSOCIATIONS.)

Palmer, comp., *Books Published in the United States, 1944; A Selection for Reference Libraries*, a supplement to the list prepared by C. F. McCombs covering 1939–43 (1946). (C. F. McC.)

Army Library Service.—In the year's activities of the Army Library service, emphasis was placed upon assuring that library service of a professional character would become a permanent part of the peacetime army. The assignment of professional librarians to United States army installations throughout the world continued. By the end of 1946 there were 214 librarians in Europe, Alaska and the Pacific and Caribbean areas; 285 librarians operated libraries within the continental limits of the United States.

These librarians supervised and operated a network of 800 libraries containing a total of 4,000,000 volumes. The aim was to render library service in accordance with fundamental principles of U.S. public library practice.

Distribution of overseas editions of books and magazines continued. By the end of the year a grand total of 275,000,000 magazines and 98,000,000 Armed Services editions had been shipped to overseas troops after the inauguration of the program in 1943. (P. E. P.)

Navy Library Service.—The beginning of the calendar year of 1946 saw the navy library service well on its way to a reduction from the wartime peak of more than 9,000 libraries to a postwar size at the end of the year of approximately 2,000. The reduction was only in numbers as the scope and basis of the work remained the same. These libraries, which include material needed in the everyday work of the ship or station to supplement the training program, to make the individual a broader and more useful citizen and for recreation, are provided for all units both afloat and ashore. The upkeep of these libraries was provided through automatic distribution of current material. The number of professional librarians provided for the major shore activities such as training centres, air stations, hospitals and marine corps activities, was reduced from 292 in January to 46 in December. (I. D. B.)

Great Britain.—The gradual restoration, in full, of the library service throughout Great Britain and the preparation of plans for expansion were a special concern in 1946. New books and new buildings were urgently needed. The official opening by the king of the Bodleian new library at Oxford took place in October. Queen Mary laid the foundation stone in 1937; the war years saw the building taken over for other purposes; but in 1946 it was restored to the university for its rightful purpose. The Rockefeller foundation contributed three-fifths of the cost of the building, which, with its great stack, would provide for the intake of two centuries. The prime minister visited Chaucer House, the London headquarters of the Library association, to speak at a ceremony marking the completion of the work of the Inter-Allied book centre. This centre was opened in 1944, after much preparatory work, for the sorting, allocation and dispatch of about 1,000,000 books collected for the restoration of war-devastated libraries in the Allied countries. Seven new schools of librarianship were established. The students were almost entirely young men and women librarians whose studies had

been interrupted by the call to military service; it was hoped that the schools, with the University of London school, would later be the normal training grounds of all recruits to the library profession. (D. C. H. J.)

Libya: see ITALIAN COLONIAL EMPIRE.

Lie, Trygve (1896—), Norwegian statesman and United Nations official, was born July 16 in Oslo. After graduating from Oslo university law school in 1919 he became secretary general of the Norwegian Labour party. Lie rose rapidly in the party's ranks and was named justice minister in the Nygaardsvold cabinet in 1935 and minister of commerce in 1939. After the German invasion of Norway in 1940 Lie escaped to England where he joined the Norwegian government-in-exile; he was first minister of shipping and supply, and then foreign minister in the exiled regime.

He headed the Norwegian delegation to the United Nations conference at San Francisco, Calif., in 1945 and to the London sessions of the U.N. that opened in Jan. 1946. At the latter conference he was elected, Feb. 1, 1946, as secretary general of the Security council.

Lie's statement (April 16) questioning the legality of the Security council's decision to retain the Iranian case on its agenda after both parties to the dispute had asked for its dismissal brought up the question as to whether he had the authority to intervene in the council's discussions. After some debate the Security council decided in the secretary general's favour and authorized him to intervene in any debate before that body.

Liechtenstein. An independent, tiny, European state, northeast of Switzerland, to which it is united by a customs union. Area, 65 sq.mi.; pop. (census Dec. 1941) 11,102. Chief town, Vaduz (capital, pop. 2,020). Ruler: Prince Franz Joseph II, b. 1906, was given ruling authority by his 84-year-old uncle, Prince Franz I, on March 30, 1938, and after the latter's death was crowned prince on May 29, 1939. Language, German; religion, mainly Roman Catholic; products, corn, wine, fruit, wood and marble. There is no army. Posts and telegraphs are administered by Switzerland. (S. B. F.)

Lilienthal, David Eli (1899—), U.S. government official, was born on July 8 in Morton, Ill. A graduate of De Pauw university in 1920, he studied law at Harvard university, receiving his degree in 1923. From 1931 to 1933 he was a member of the Wisconsin Public Service commission, and in the latter year Pres. Franklin D. Roosevelt picked him as a director of the newly created Tennessee Valley authority with authority to develop its power program; he became chairman in 1941. He was associated also with the atomic experiments conducted at near-by Oak Ridge, Tenn., in the capacity of consultant. His committee's report to the state department on the control of atomic energy was the basis on which the United States drafted its proposals for the United Nations Atomic Energy commission. On March 28, 1946, the state department revealed that the Lilienthal report called for world monopoly of uranium under an international authority which would forbid its use for explosives but permit distribution of "denatured" plutonium for industrial uses and experimental work. He resigned from TVA to become chairman of the U.S. Atomic Energy commission (Oct. 28, 1946) which was to direct and control the development of atomic energy in the United States.

Lime. Demand for agricultural, industrial and refractory lime decreased in the United States in 1944, while building demand increased. The total output declined from 6,473,563 short tons in 1944 to 5,920,579 tons in 1945, including 4,565,551 tons of quicklime and 1,355,028 tons of hydrated lime; by uses, the breakdown was: agricultural 373,410 tons; building 549,547 tons; chemical 3,810,288 tons; and refractory 1,187,334 tons. Practically all of the 1945 decline may be accounted for in uses of lime connected with the metallurgical industry (refractories, smelter fluxes, ore concentration, calcium carbide to make acetylene for welding, and other metallurgical applications); declines in other uses were offset by a number of relatively small increases.

Canadian production of lime dropped from 885,214 short tons in 1944 to 831,982 tons in 1945. (G. A. Ro.)

Limes: see FRUIT.

Limestone: see STONE.

Linen and Flax. U.S. linen became almost commonplace on the counters of U.S. stores during 1946 but the price was still in the luxury class. The production was not sufficient to warrant specific statistics as to yardage in the official reports of the census bureau but its sponsors believed that it had a place in the future linen market alongside the older linen products of Europe and China. With an increased production of flax straw in the United States, still concentrated in Oregon, some interest was expressed during the year in the so-called cottonized flax, a combination of cotton and flax. This type of yarn was extensively used in Germany, Italy and Poland prior to and during World War II, and some work was carried out in the United States in the Georgia experimental station of the department of agriculture.

European production was still recovering from the effects of war destruction and production control. In November, the Scottish linen manufacturers complained that continued government controls prevented their returning to normal prewar levels. In Ireland, the Linen Trade Advisory committee was reconstituted by the minister of commerce, consisting of 13 members, 6 from the central council of the linen industry, 6 appointed by the minister of commerce and 1 from the textile finishing trade in Northern Ireland. The 1946 flax crop in Northern Ireland was expected to yield 6,300 long tons of scutched flax compared with a wartime peak of 19,200 tons in 1944. With government aid, 44 new scutch mills were erected and 137 mills enlarged during World War II bringing into operation approximately 400 scutch mills. Flax cultivation in 1946 dropped to 35,778 ac. compared with 80,299 in 1945 and 124,500 ac. in the peak year of 1944.

During the first 6 months of 1946, the total flax fibre and tow consumed by the United Kingdom was 19,250 tons. Prior to the war, this consumption was 68,000 long tons annually, of which only 6,000 tons were home grown.

More than 90% of the flax, before 1939, came from the U.S.S.R., the Low Countries and the Baltic states. In 1946, these countries were beginning to re-enter the field. Belgium's acreage was unofficially estimated at 50,000 ac., although throughout German occupation, the acreage was said to have been highest in history. The Belgian goal was 86,500 ac. annually. In Latvia, flax production suffered severe losses during the war. Output declined from 164,000 centners in 1940 to 37,000 centners in 1945. Their goal, to be achieved by 1950, was 200,000 centners, according to the five-year plan. Bulgarian flax crops also were comparatively smaller by the end of the war. Available information for 1945 showed a flax output of 172 tons (5,259 ha.) down from the 1944 total of 905 tons (11,801

ha.). In the U.S.S.R., the council of ministers of soviet Russia were planning a yield of 120,000 tons of flax fibre and 65,800 tons of flaxseed. The flax plantings in 1947 were set at 1,302,800 ha.—1,036,500 ha. on collective farms and 266,300 ha. on small farms. French scutching mills expected to produce 12,000 metric tons of flax fibre in 1946. In addition, they expected to receive 15,000 metric tons from Belgium and the soviet union. This supply would mean a total production for 1946 of 20,000 metric tons of linen yarns of all description.

Spain planted more than 1,000,000 ac. to flax in 1946, it was estimated, compared with about 700,000 in 1945. Poland was also returning to the industry with a monthly production of 10,806,000 m. (2,092,293 yd.) of fabrics and 550,000 kg. (606 short tons) of yarn during 1946. Turkey reported an output in 1945 of 1,743 metric tons, a sharp decrease from wartime production.

A new interest in combinations of linen and ramie developed in 1946. The fibre was produced extensively in China with some amounts coming from Brazil and the Florida Everglades section. It is a heavy fabric, suitable only for sportswear of the sturdier type. Ramie is closely affiliated with linen in appearance and texture. Its use in combination with linen and its low price were expected to open new fields for flax.

Production of flax fibre in Canada, considerably developed during World War II, continued at about the same pace. The grade scutched flax yield in the 1946-47 season was 937 tons with 1,874 short tons of tow. The estimated planted area was 15,761 ac. In the previous season, there were 985 tons of flax and 1,521 tons of tow. Of this, 3,642 tons were exported, compared with 3,375 tons in 1944-45. The United States took 1,852 tons, or almost all, of the tow. This nearly tripled the previous season's receipts. Shipments to the United Kingdom, on the contrary, decreased by nearly 45% over the 1944-45 exports of 2,674 tons. Canadian acreage for 1946 was 25,000 ac. or 18% over the 1945 area.

Flax production in countries of high cost where it was introduced during the war as an emergency source continued to decline. In British East Africa, for example, the flax growers turned to other crops as the result of the British ministry of supply's decision to stop guaranteed purchases after 1946.

The linen industry of the United Kingdom, concentrated in Northern Ireland, showed an export of 31,152,000 sq.yd. during 10 mo. of 1946. During the first 9 mo. the exports were valued at £9,651,938, compared with £4,108,521 in the like period of 1938. The United States received 45% of the 27,000,000 sq.yd. of piece goods as well as 70% of the damask table linen. Total exports in the 9 mo. were 61% piece goods, 10% finished thread, 7% handkerchiefs and 7% table damask.

Lions Clubs, International Association of: see SOCIETIES AND ASSOCIATIONS.

Liquor Control: see LIQUORS, ALCOHOLIC.

Liquors, Alcoholic. From the beginning of World War II until V-J day, the contribution of the beverage distilling industry amounted to an approximate total of 750,000,000 gal. of industrial alcohol, representing almost half of the total amount of this commodity turned out during the war years by all producing sources. The uses of war and industrial alcohol were mainly for the production of synthetic rubber, smokeless powder, hospital supplies and various other essential civilian and industrial products.

Another wartime activity of the beverage distilling industry was its contribution to the production of penicillin.

In addition, the beverage distilling industry continued to pro-

duce high-protein animal feed as a by-product of the distilling process. The nutrient value of the recovered feed is considerably enhanced by the addition of proteins, vitamins and fats through the use of yeast and limestone water during fermentation. This animal feed was a significant factor in the increase of about 150% in meat production during the war over prewar levels. Department of agriculture figures revealed that the production of dried grains in the year ending Oct. 1, 1946, was 330,000 tons, an increase of 35% over the 1939-42 average of 244,000 tons, and it was expected that production would reach 500,000 tons in the 1947 year.

The wartime concentration on alcohol production by beverage distillers not only severely depleted their aged whisky inventories, but also disrupted the aging schedules of whisky. This arose from the fact that consumers were being supplied with beverage spirits during the war period, although the whisky thus used was not being replaced by new production.

Evaporation and leakage were also important in depleting aging inventories. Each year that whisky stays in charred barrels during its aging period a considerable quantity is lost because of evaporation and leakage. For example, at the end of four years, about 22% of the whisky originally stored for aging is lost because of these factors. (Official allowance for tax purposes is made by the U.S. bureau of internal revenue with respect to these losses.)

Therefore, at the end of World War II, the inventory position of the whisky distillers was in a sense much the same as that at the end of prohibition. Inventories of whisky in Aug. 1945, were 262,200,000 tax gal. on a net inventory basis, about 34% less than the 413,500,000 net tax gal. stored in bonded warehouses at the end of Sept. 1942.

Because supplies of war alcohol were judged to be sufficient for immediate war needs, the industry was given three one-month furloughs from its war job in Aug. 1944, Jan. 1945 and July 1945. Although the beverage distilling industry was released from war work by the WPB on Aug. 31, 1945, the department of agriculture continued to restrict grain allotments to the industry for beverage spirits production.

An allocation of grain for four and one-half days of operation was made in Aug. 1945, and a five-and-one-half day production period was granted the industry the following month. Gradual extensions in grain allotments were granted until a maximum of ten days was reached in Dec. 1945 and Jan. 1946. Beginning with Feb. 1946, however, allocations of grain for beverage spirits production were tightened.

Beginning in March 1946, beverage distilling plant operations were limited to five days in each month; for the months of May through August of 1946 grain allocations were further restricted to the equivalent of three days of operation per month. Subsequently, there was a slight relaxation of government restrictions because of improving grain supplies and the industry was permitted to operate about three and one-half days in each of the September-November months.

During all this time, there were restrictions on the kind of grain used by the industry, as well as the amount of grain available for production of potable spirits. Use of wheat was banned, rye use was limited and the industry was permitted the use of corn of grades 4, 5 and sample only.

At the close of Nov. 1946, the department of agriculture officially announced substantial liberalization of restrictions on corn for beverage spirits production. The department's announcement stipulated that beginning Dec. 1, 1946, beverage distillers would be permitted unlimited quantities of corn grades 4, 5 and sample. However, the ban on wheat use continued and the use of rye was limited to 6% of total grain used in any one plant in any one month.

This latest move of the department of agriculture was dictated by record crops of corn and other grains—in most instances well above the previous peak levels. The relaxation of corn use, it was expected, would permit the industry to make progress in rebuilding depleted inventories of whisky, especially bourbon.

Wartime and postwar restrictions further slowed down the efforts of distillers to bring their inventories up to "normal" levels. Thus by June 1946, inventories of whisky were only 308,086,000 tax gal. on a net inventory basis.

Distilled spirits production in the fiscal year ended June 30, 1946, amounted to: whisky 147,476,460 tax gal., gin 7,456,384 tax gal., rum 2,657,580 gal., brandy 34,365,037 gal.

The limited resumption periods for beverage spirits production which were permitted in 1944, 1945 and 1946 did not allow distillers to do more than about maintain withdrawals of whisky from inventories at the same level as the previous year—fiscal year 1946 withdrawals totalled 63,200,184 as against 63,891,224 tax gal. in the 1945 fiscal year. These whisky withdrawal totals were well below the prewar levels. Increased supplies of whisky (and gin) were put into consumption channels through the use of grain neutral spirits, which were used principally to make the popular whisky spirit blends. Thus, blending spirits used totalled 96,681,455 tax gal. in the 1946 fiscal year as against only 65,552,162 tax gal. in the 1945 fiscal year.

As a result of the increased use of blending spirits, bottled output of all whiskies rose from 143,171,432 wine gal. in the 1945 fiscal year to 163,709,118 tax gal. in 1946.

Total consumption of all distilled spirits in 1944 recovered to 166,704,541 wine gal. from 1943's low level of 145,515,666 gal. In 1945, consumption was 190,044,134 wine gal., reflecting rising national income and easier supplies. For the first six months of 1946, consumption of all distilled spirits was 114,983,353 wine gal. as compared with 88,614,720 wine gal. during the first six months of the previous year. This increase was to some extent because of the return to the United States of millions of servicemen who had been overseas during the first half of 1945.

The cessation of Scotch whisky production in Great Britain from 1940 through the end of 1944 (partially resumed early in 1945) resulted in the depletion of Scotch whisky inventories and the consequent gap in aging schedules, as happened in the United States, and further reduced the amounts of Scotch available for export. In 1945, Scotch imports into the United States dropped to 3,985,570 tax gal. from 4,446,050 tax gal. in 1944. Prewar imports of Scotch whisky had been approximately 7,500,000 tax gal. per year. Scotch whisky imports for the first nine months of 1946 totalled 2,917,884 tax gal. as against the 2,933,684 tax gal. for the same period the year before.

Scotch whisky distillers made relatively generous quantities of whisky available to the foreign markets during the war years despite the fact that in so doing they were steadily reducing their inventories of aged and aging whisky. What the Scotch industry had been doing, in effect, was the same thing the U.S. industry had been doing—drawing upon reserves of whisky which were in reality earmarked for aging and use over future years.

With the exception of the United Kingdom, the major sources

BLIND-FOLDED "EXPERTS" tasting samples of whisky to see whether they could distinguish imported Scotch from domestic Scotch type whisky, in a test held by the Illinois State Liquor commission in 1946

of imported spirits during 1946 gradually resumed their prewar status. Canada was again resuming its position as a major exporter of whisky to the United States. France was again becoming an important shipper of brandy, cordials and liqueurs. Shipments of gin from Cuba, Mexico and Argentina declined sharply during the first nine months of 1946 from the first nine months of 1945. During the war years, the Caribbean countries were the chief suppliers of foreign spirits sent to the United States. Total distilled spirits imports for the first nine months of 1946 were 16,972,364 tax gal. as against 16,462,585 tax gal. for the first three-quarters of the previous year.

Federal tax receipts from alcoholic beverages constituted the major source of government commodity tax revenue. During 1946, as a result of record high tax rates and substantially increased population, federal receipts from taxes levied on alcoholic beverages reached peak levels. It was indicated that full calendar year collections for 1946 from distilled spirits, wine and beer would aggregate approximately \$2,600,000,000. In addition, revenue from alcoholic beverages constitute a major source of income to state and local governments; during the calendar year 1946, it was estimated that state and local returns from alcoholic beverages were \$700,000,000. The following table shows internal revenue receipts from distilled spirits, wine and beer during each of the past several years as well as for the first nine months of 1945 and 1946:

Table II. — Revenues from Alcoholic Beverages

	Distilled Spirits	Beer	Wine	Grand total
1941	\$ 558,547,795	\$348,876,726	\$20,008,266	\$ 927,432,787
1942	777,793,659	403,436,418	33,943,923	1,215,174,000
1943	906,378,809	515,063,123	32,759,793	1,454,201,725
1944	1,408,368,230	627,458,724	47,625,921	2,083,452,875
1945	1,661,793,763	659,055,927	49,073,828	2,369,923,518
1st 9 months, 1945	1,183,150,111	492,683,049	33,578,885	1,709,412,045
1st 9 months, 1946	1,436,492,766	479,985,544	54,955,527	1,971,433,837

(A. J. LI.)

Table I. — Distilled Spirits Statistics, Fiscal Year Ended June 30, 1946

	Whisky	Gin	Rum	Brandy	Neutral Spirits*	Total
			(Tax gallons)			
Production	147,476,460	7,456,384	2,657,580	34,365,037	96,681,455	288,636,916

*Represents neutral spirits used in rectification, neither production nor withdrawal figures show volume of neutral spirits actually used for beverage purposes. Production and withdrawal equivalents are best determined by employing neutral spirits used in rectification (for whisky blending, and gin, cordial and liqueur processing).
Source: Prepared by Licensed Beverage Industries, Inc., from data of the Alcohol Tax Unit, Bureau of Internal Revenue, Treasury Department.

Liquor Control.—The 13th year of repeal, 1946, saw the removal of many of the government restrictions affecting alcoholic beverages. OPA ceilings on whisky came to an end. With some exceptions, they had previously been removed on all other alcoholic beverages.

Early in the year, President Harry S. Truman, by proclamation, limited the amount of grain to be used by distillers and brewers for the manufacture of their products. World famine conditions impelled this action. Month by month limitation increased. In November, the grain allotment by the department of agriculture to distillers was enough for only about three and one-half days of operation.

Brewers were restricted to approximately 70% of normal usage. As a practical matter, before the year was over, brewers and distillers were in a position to make as much of their product as they desired. The restriction on grain for distillers related only to the better grades of corn, to rye and wheat.

In the last days of the year President Truman announced the end of hostilities, which meant that within six months, unless congress passed new laws, the wartime excise tax of \$9 a proof gallon would go back to \$6.

Tax collections on alcoholic beverages remained high. The first ten months showed a total of \$2,200,000,000 as against \$2,000,000,000 in 1945. Distilled spirits tax collections alone were \$1,600,000,000, an increase of 19% above 1945. Taxes on beer and wine accounted for the balance. Total revenues for 1946, including state taxes and local and state licence fees, ran more than \$3,000,000,000.

Local option made minor gains: The wet and dry picture remained much the same; 81% of the population lived in wet areas. The number of monopoly states remained unchanged.

The National Committee on Alcoholism gained greatly in strength during 1946. State committees were operating in many states. Changes in state laws, while numerous, were not of great importance.

Agitation for change in the present federal method of retail liquor dealers tax stamp issuance continued vigorously; a fight for the passage of legislation doing away with this system was anticipated in the 1947 congress. Bills calling for partial or total prohibition, and bills against liquor advertising, did not find much support.

Industry efforts at self-regulation continued. An important milestone was the merger of Allied Liquor Industries and the Conference of Alcoholic Beverage Industries—both strong public relations and propaganda institutions—into a new agency called Licensed Beverage Industries, Inc. L.B.I. had been extremely active in urging upon retailers strict obedience to law and the maintenance of wholesome conditions in taverns. It had advertised extensively, calling attention to the accomplishment of the distillers during World War II in the manufacture of alcohol and the enormous revenues and large employment caused by the liquor industry. The monopoly states continued their system of rationing in 1946.

Progress in control in 1946 was the result, not only of better understanding of the problems, but also of a will both on the part of officials and the industry to cope more adequately with them. More effective methods were urgently needed and it seemed not too much to hope they would be forthcoming. (See also BREWING AND BEER; INTOXICATION, ALCOHOLIC; WINES.)

Lithium Minerals. The production of lithium ores and compounds in the United States reached a new record high in 1944; in spite of decreased outputs of amblygonite and lepidolite, gains in spodumene and dilithium sodium phosphate gave a total of 848 short tons of LiO₂ content shipped in 1944, against 463 tons in 1943, dropping to 274 tons in 1945. The industry was trying in 1946 to develop new peacetime uses to utilize the available production capacity.

(G. A. Ro.)

Lithuania. A Baltic country of northeastern Europe, N. of Poland; in 1941 it became a part of Germany's "Ostland," and in 1944 was reconquered by the Red armies and re-established as a republic of the U.S.S.R. Area, 22,958 sq.mi. (1940); pop. (Jan. 1, 1940) 2,879,070. Chief cities: Vilnius (Vilna, cap. 1942, 182,000); Kaunas (1941 est. 120,000).

History.—Lithuania's independence, won after World War I, was short-lived. In 1940 the country was incorporated into the U.S.S.R. as one of the constituent republics. In 1941 it re-declared independence, but the invading Germans allowed the state to function for only seven weeks. In 1944-45 the Russians drove out the Germans and reintegrated Lithuania into the soviet system.

Thousands of freedom-loving Lithuanians continued to fight for independence. The Russians in turn insisted on maintaining control, reoriented education and sent in officials to assure a government friendly to the soviet union. Small bands of guerrillas attacked the Russians, broadcast propaganda from secret radio stations and in illegal newspapers and hampered the administration in every way possible. Repeated skirmishes resulted in many deaths on both sides, and the whole opposition movement intensified the soviet attempt to deport the revolutionary elements. Despite the paucity of news and the contradictory nature of the reports available it was obvious in 1946 that agriculture was suffering. Women and children tried to work the fields, but much land lay idle; thousands of men were dead or deported or in voluntary exile. The United Nations Relief and Rehabilitation administration reported 57,243 in the British, U.S. and French zones of occupied Germany. The Lithuanians themselves reckoned the number at 70,000 and counted another 8,275 in Austria, Denmark and other European countries. They claimed 1,300 Lithuanian students in the universities of western Germany; 400 of these were at the Baltic university in Hamburg.

The United States and Canada already held about 25% of the Lithuanian-speaking people. Since these countries, like Great Britain, still refused to recognize the soviet regime of the Baltic lands, it was natural that they should become centres of propaganda for the freedom of the Baltic states. Pres. Harry S. Truman, members of congress, the state department and governors were repeatedly memorialized on the plight of Lithuania, and they gave repeated expressions of sympathy as replies. The U.S.S.R. was for the most part silent, resting upon its *de facto* control. When the Lithuanian minister Povilas Zadeikis, was invited to a state department dinner, however, a Russian correspondent of *Pravda* complained that "state department officials retained a 'sneaky' feeling for 'dead souls.'"

Reports from neighbouring Latvia indicated that progress was being made by the Russians in the industrialization of all the Baltic countries (see article on LATVIA).

Education.—In 1938-39 there were 2,335 private schools with 298,429 scholars and 83 secondary schools and gymnasias with 19,539 scholars. Part of the university at Kaunas was moved back to Vilnius Jan. 15, 1940.

Finance.—The monetary unit was the lita (=16.1 U.S. cents at par, established in 1922 as one-tenth the U.S. gold dollar). At the end of 1939 the foreign debt was 68,915,300 litas, and the domestic debt of the government was 65,231,200 litas. In 1939 the budget estimate of the government balanced at 341,785,274 litas. After 1945 the monetary

unit was again the ruble, but dependable statistics were not yet available for 1946 at the end of the year.

Trade and Communication.—In 1938 imports amounted to 223,686,000 litas and exports to 233,200,000 litas. Chief articles of import were cotton yarn and thread, woollen yarn and thread, cotton fabrics, woollen fabrics, coal and fertilizers. Chief articles of export were meat, butter, flax fibre, pigs and eggs. Almost 40% of the exports went to Great Britain, 27% to Germany, 5.7% to the U.S.S.R. Imports came 31% from Britain, 24.5% from Germany, 6.7% from the U.S.S.R. In 1938 telephones numbered 26,591; radio sets 53,667, broadcasting stations 2.

Agriculture.—Almost 77% of the population was engaged in agriculture, and 49% of the land was arable. Chief products in 1939 and their output in short tons were as follows: rye 726,636; wheat 282,850; barley 282,740; oats 450,841; potatoes 2,290,469; flax fibre 31,416; butter 21,890. The 1939 estimate of livestock was: horses 521,000; cattle 1,004,000; sheep 1,224,000; pigs 1,224,000; poultry 5,130,920.

Manufacturing.—In 1938 about 1,441 industrial establishments employed 40,818 people. Meat and fish products were valued at 44,919,000 litas; manufactured timber 12,532,000 litas; tissues and yarns 28,131,000 litas; machines, etc., 13,215,000 litas; leather goods 14,374,000 litas. Lithuania increased industrial production from an index of 100 in 1929 to 354 in 1939. Total industrial production of 1939 was 405,749,000 litas.

Livestock. The total number of livestock on farms, including chickens, ceased to decline during 1945 and on Jan. 1, 1946, was estimated by the U.S. department of agriculture at 146,535,000 animal units, compared with 146,187,000 units in 1945 and the peak of 171,149,000 units in 1944. Every class of livestock declined during 1945 except hogs and poultry. The strong demand for meat through 1946 halted the decline in the case of poultry but it kept on with respect to sheep, horses and cattle.

Prices of all meat animals, considered as a group, stood at an index of 240 compared with 111 in 1940—a gain of 139%. The declining military needs, smaller purchases for relief, the end of subsidies, all led farmers to become conservative. The large feed supply was a factor on the other side but not sufficient to maintain production. Civilian supplies of meat at about 145 lb. per capita were larger than the 138 lb. in 1945 because of the reduced military purchases. Exports declined during the second half of 1946; on Sept. 30 the government ceased buying except for the United Nations Relief and Rehabilitation administration which was terminated Dec. 31. The strong demand for beef checked the decline in cattle production that began in 1945. More cattle were put into feedlots, particularly in the last half of the year when the movement of stock and feeder cattle increased. The high prices of beef cattle in July and August and again in September stimulated feeding of cattle. Lamb feeding declined, chiefly because of the smaller number of lambs raised. The good feed crops, especially corn, led hog raisers to feed hogs to heavy weights. The 1946 fall pig crop was about 6,000,000 head less than in 1945. The high fall hog prices led to heavier breeding for spring pigs in 1947.

The total value of livestock on farms on Jan. 1, 1946, was estimated at \$8,922,700,000, not including chickens which were valued at \$662,137,000. This total was about \$800,000,000 more than the value on Jan. 1, 1945. All species of animals were worth more per head, except horses and mules. (See also AGRICULTURE; CATTLE; HOGS; HORSES; MEAT; POULTRY; SHEEP.) (J. C. Ms.)

Numbers of Livestock on U.S. Farms, Jan. 1, 1946, 1945 and average, 1935-44

(In thousands of head)

	1946	1945	Average 1935-44
Horses	8,259	8,841	10,596
Mules	3,196	3,405	4,133
Cattle	79,791	81,909	71,037
Milk cows	26,785	27,674	25,656
Sheep	44,241	47,780	52,768
Hogs	62,344	59,759	55,300
Chickens	525,536	510,939	447,889
Turkeys	8,734	7,323	6,789

Local Government: see MUNICIPAL GOVERNMENT.

London. London bid a formal farewell to the World War II period in June 1946 when a victory celebration was held. It consisted of a foot-march through main streets by soldiery, a longer suburban tour by a mechanized force and an air parade, all the Allied fighting services eventually joining in a salute and march past the king and queen in the Mall. London's return to peace was symbolized when Sir W. Bracewell Smith, lord mayor, used his gilded coach in the lord mayor's show.

The return of peacetime entertainment was severely restricted by the shortage of theatres and concert halls. Distinguished national playwrights were unable to lease London theatres. When Sir Thomas Beecham formed the new Royal Philharmonic orchestra for the Royal Philharmonic society, it had to undertake its first series of concerts at a Croydon cinema because the Albert hall bookings would allow only a monthly concert. Covent Garden opera house, now in the safekeeping of national trustees, became the new home of Sadler's Wells ballet, recruited its own orchestra and established British opera under Karl Rankl. During the year the Ballet theatre of New York and the San Carlo opera of Naples had long and successful seasons at Covent Garden. The London Philharmonic orchestra started Sunday concerts there.

Housing remained as London's principal social problem. At one time it became so pressing that squatters took possession of some large empty properties and were turned out by legal action. The five chief instigators were prosecuted and bound over for two years. Meanwhile the ministry of town and country planning pressed on with the scheme to build ten satellite towns on the fringes of London for its surplus population. Under the New Towns act, 1946, satellites were announced for Stevenage, Crawley, Hemel Hempstead and Harlow. Others for Ongar and Pitsea-Laindon were recommended. In London proper rehousing proceeded slowly owing, principally, to labour shortages. By the end of October, 11,884 families had been rehoused, mostly in rebuilt bomb-damaged premises. The permanent new houses and flats finished numbered 356 and the prefabricated dwellings erected were 3,090. The London County council decided to take over Hurlingham, the polo grounds, for housing. Rents tribunals were set up to hear complaints of excessively-rented furnished accommodation. Re-equipment for education also went ahead slowly, urged on by repeated protests by teachers for better school accommodation. The L.C.C. budget for education in 1946-47 reached the record figure of £6,000,000.

Long-term plans continued to be made. A plan for rebuilding the City of London was rejected by the government chiefly on the grounds that it neither adequately set off St. Paul's cathedral nor solved the through-traffic problems. The City engaged two town-planning experts to help it to devise a new plan. The larger traffic problem of London was the subject of a report of railway technicians who proposed nine new deep-level double-tunnels beneath London carrying tracks for full-sized electric trains and acting as underground trunk routes through the city. They estimated that more than 100 mi. of tunnels and tracks could be erected in 30 years at a cost of £240,000,000.

The political complexion of London went more noticeably Labour. The results of the triennial L.C.C. elections in March were: Labour, 90; Conservative, 30; Liberal, 2; Communist, 2. This represented a gain of 14 seats by Labour which had been 12 years in power. Under the proposals of the Boundary commission which rerigged boundaries of parliamentary divisions, London's parliamentary representation would be cut down from 60 to 40 seats in the L.C.C. area. On the ground that the commission fixed new boundaries on a wartime register of voters, the government ordered the work to be done again on the most recent register.

Crime statistics for London suggested that the postwar wave

of crime in the metropolis was well on the wane. Indictable crimes for the first nine months of 1946 were roughly a tenth less than those during the same period of 1945. Cases of shop-breaking, for example, fell from 1,239 to 959. Murders in the period were 15 against 17 in 1945 but 6 of these were unsolved. The police were greatly aided by the London system of dialling "999" by the public. More than 50,000 of such telephone calls were received by the police and for every ten, including false alarms, one criminal was caught. Special appeals for recruits were issued by the Metropolitan police during the year and a call was made for 6,000 voluntary special constables.

(P. BN.)

London University. 1946 was a year of great activity in all branches of the university. A return to peacetime conditions was hampered both by the extensive air raid damage which remained unrepaired and by the general shortage of living and teaching accommodation. The situation was further complicated by the tremendous demand from ex-service and other students for admission to university courses. The number of internal students began to approach prewar figures and the number of external students outstripped the 1939 figure by 11,000, reaching a total of 21,000. A large number of appointments were made to fill vacancies and also to fill new chairs and readerships instituted in connection with the many new developments either planned or in operation.

For the first time after 1939 all the schools and institutions of the university were once more established in London. The university library was reopened to readers and the university headquarters returned to the senate house, although the central office of information continued to occupy a large part of it for some months. The university union reopened in temporary premises, pending the erection of a permanent building on the Bloomsbury site. The athletic union revived some of its prewar clubs and established new ones, all of which had successful seasons.

The university welcomed back the chancellor, the earl of Athlone, on his retirement from the governor-generalship of Canada. It became possible to revive some of the peacetime ceremonies: presentation day ceremony was held in May at the Albert hall and was followed by the usual Westminster abbey service; in July Princess Elizabeth attended a special degree ceremony in the senate house at which she received the honorary degree of bachelor of music; and foundation day was celebrated in Nov. by a dinner, reception and honorary degree ceremony.

Loran Navigation: see ELECTRONICS.

Lorenz, Adolf (1854-1946), Austrian surgeon was born on April 21 in Vidnava, Silesia. He was famed throughout the world for his successful work in correction of orthopaedic ailments by "bloodless surgery." Dr. Lorenz made more than 20 visits to the United States, where his arrival was generally attended by such wide publicity that he incurred the scorn of a large part of the U.S. medical profession; the charge against him was that countless numbers of cripples had "their hopes raised to the skies, only to have them blasted when they find they have been misled." His unorthodox techniques were the subject of considerable controversy within the profession. The New York health commissioner welcomed his arrival in that city despite strong opposition from local doctors and arranged for him to examine more than 2,000 cripples, upon 20 of whom he operated. He retired in 1934 and two years later published his autobiography, *My Life and Work* (1936). He died in Vienna on

Feb. 12. (See *Encyclopædia Britannica*.)

Los Angeles. Leading all U.S. cities in area with 452.2 sq.mi., Los Angeles in 1946 stood as the fifth most populous city in the country. As a result of a special census, the U.S. census bureau credited it with a population of 1,805,687, a gain of more than 301,000 over the 1940 census figure of 1,504,277. Mayor (Dec. 31, 1946) Fletcher Bowron. Los Angeles county, which contributes most of the area of the metropolitan district, in 1946 had a population estimated at 3,525,000 as compared with 2,785,643 in 1940.

In 1946 Los Angeles continued to expand its industrial capacity, contrary to general expectation. In the first 11 months of the year \$140,000,000 was invested in the creation of new industrial plants and expansion of existing ones. This represented an investment greater than the total for the years from 1934 through 1940. Developments were characterized by the construction of several new automobile assembly plants in addition to steel mills, chemical factories and the continued operation of all war plants except shipyards.

Retrenchment in employment proved to be less than was expected. By the middle of the year manufacturing employment in Los Angeles county stood at 233,100 as against 154,700 in 1940. Demobilized members of the armed forces were being absorbed into the economic pattern, but housing continued to remain an acute problem because of the lack of home building during the war and because of continued inactivity in that field on account of material shortages.

Los Angeles continued its lead in the production of commercial aircraft and development of new military models. It was the third greatest generator of air traffic in the United States and exceeded all cities on the west coast combined in generation of transcontinental traffic.

The city is the hub of the richest agricultural county in the United States, and the value of its products in 1945 exceeded \$200,000,000—an all-time record—and indications were that 1946 was a record year in volume of production if not in value.

In the fiscal year 1946-47 the assessed valuation of the city was \$1,664,548,330. The city tax rate was \$6.4188 per \$100 with the assessment at 50% of market value on real estate. The budget for 1946-47 was \$69,409,129, not including harbour and water and power departments.

(J. E. SN.)

Louisiana. One of the west south central states of the United States, admitted to the union in 1812 as the 18th state, Louisiana is popularly known as the "Pelican state," "Creole state" or "Bayou state." Area 48,523 sq.mi., of which 45,177 sq.mi. are land. Pop. (1940) 2,363,880, of which 1,383,441 or 58.5% were rural and 980,439 or 41.5% urban; 64% native whites, 34.3% Negroes and 1.7% foreign-born. On July 1, 1945, the bureau of the census estimated the state's population at 2,456,057. Capital, Baton Rouge (34,719). Other important cities: New Orleans (494,537), Shreveport (98,167), Monroe (28,309), Alexandria (27,066), Lake Charles (21,207), Lafayette (19,210).

History.—The legislature met on May 13, 1946, in regular 60-day biennial session. Four new agricultural experiment stations were established, and state and parish fairs received increased financial aid. Appropriations for elementary, secondary and higher education were increased, and higher salaries were provided for all public school teachers except those in the highest bracket. A legislative committee of eight members was created to make a study and survey of the needs and necessity for improvement in all state public schools, colleges and universities, with findings of this committee to be used as a basis for future educational legislation.

PARADE at the Mardi Gras, pre-Lenten carnival held in New Orleans, La., in 1946, after a four-year wartime ban. Shown is king of Rex and king of the Mardi Gras, identified as U.S. Judge Wayne G. Borah

Many salaries paid from state funds were increased. The per diem of legislators was doubled, and substantial salary increases were provided for state executive department heads and for some judges and other local officials. A pension and retirement system was established for all state employees covered by civil service; a state auto driver's licence law was passed.

After failure of a bill for calling a constitutional convention, the legislature directed the Louisiana Law institute to prepare a draft of a *projet* for a constitution of the state, to be laid before the 1948 session. There were 31 proposed constitutional amendments submitted to the electorate, 25 of which were approved at the general election of Nov. 5, 1946.

The most controversial issue before the legislature was a series of proposals to define the legal responsibility and to restrict certain activities of labour organizations. Some of these proposals were enacted into law after heated discussion, while others were defeated; and after the session adjourned, the governor vetoed the most highly controversial labour measure passed by the legislature.

Aside from the legislative session, the most important political event of the year was the defeat of Robert S. Maestri for reelection as mayor of New Orleans, thus retiring from office the last prominent leader of the old Huey P. Long political machine which was so powerful in Louisiana during the 1930s.

Other important events during the year were: attempts to alleviate the critical housing shortage in the larger urban centres; rehabilitation and adjustment to civil life of veterans of World War II; fight by state authorities to prevent exportation of natural gas from the state; labour controversies arising from

the increased cost of living and the shift from wartime conditions in industry; state leases of its coastal waters for petroleum exploration; plans for an enlarged program of state highway construction, and for a comprehensive drainage, flood control and reclamation project and the mounting state income from taxes of all kinds, which reached a new high because of prosperous conditions in agriculture and industry.

State officers in 1946 were: James Houston Davis, governor; J. Emile Verret, lieutenant governor; Wade O. Martin, Jr., secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; Fred S. LeBlanc, attorney-general; John E. Coxe, superintendent of education; Lucile May Grace, register of land office; Harry D. Wilson, commissioner of agriculture and immigration.

Education.—In 1946 the 823 public schools for whites enrolled 210,917 elementary and 58,631 high school pupils and employed 10,037 teachers; the 1,767 public schools for Negroes enrolled 151,839 elementary and 13,908 high school pupils and employed 4,526 teachers. The 175 private schools for whites enrolled 47,075 elementary and 9,139 high school pupils and employed 1,734 teachers; the 79 private schools for Negroes enrolled 11,922 elementary and 2,680 high school pupils and employed 344 teachers. The state maintained 11 public trade schools.

State appropriations for the 1946-47 fiscal year were \$28,854,000 (exclusive of local funds) for public elementary, secondary and trade schools and \$11,000,000 for state-supported colleges and universities. All the colleges and universities were crowded to capacity by returning veterans seeking higher education with federal government assistance.

Social Insurance and Assistance, Public Welfare and Related Programs.—Louisiana expended nearly \$20,000,000 on public welfare work in 1946. Approximately 98,500 individuals were aided, including 50,535 aged persons, 36,809 dependent children, 1,819 needy blind, 506 foster children and 8,820 special cases. In spite of labour shortage and high wages prevailing in industry and agriculture, state expenditures for general relief and unemployment insurance increased considerably as compared with the preceding year.

The state maintained the following institutions in 1946: charity hospitals at New Orleans, Shreveport, Lafayette, Monroe, Pineville, Independence and Bogalusa; insane hospitals at Jackson and Pineville; a tuberculosis sanitarium at Greenwell Springs; schools for the blind and the deaf at Baton Rouge (for whites) and at Scotlandville (for Negroes); and a training school for the feeble-minded at Alexandria. The 1946 legislature provided for the establishment of another tuberculosis sanitarium at Ruston, the Hot Springs hospital near Alexandria and a special school for spastic children.

The state maintained two prison farms for its 3,300 adult offenders and separate training institutes for about 350 white juvenile delinquents. A new training institute for delinquent Negro boys was under construction near Baton Rouge.

State appropriations for charitable and correctional institutions were \$14,600,000 for the 1946-47 fiscal year.

Communication.—In 1946 Louisiana had 18,200 mi. of public highways, 14,800 mi. of which were state-maintained, 10,500 being gravelled and 4,300 paved. State expenditures for highways were only \$13,191,737 for the 1945-46 fiscal year, because of scarcity of materials for new construction; but an ambitious construction program was launched during the year, and about \$40,000,000 (exclusive of matching federal funds) were made available for the 1946-47 fiscal year. There were 4,400 mi. of railways and 4,800 mi. of navigable waterways. New Orleans, Baton Rouge and Lake Charles are ports for ocean-going commerce, with aggregate tonnages of 39,446,276 in 1941, distributed as follows:

Table I.—Commerce of Louisiana Ports in 1941

Ports	Foreign	Coastwise	Internal	Total
Baton Rouge	509,522	3,608,249	4,031,737	8,149,508
Lake Charles	76,026	1,154,196	9,159,277	10,389,499
New Orleans	5,096,509	4,318,868	11,491,892	20,907,269
(Totals)	5,682,057	9,081,313	24,682,906	39,446,276

There were 26 airports for land planes and 11 seaplane bases and anchorages in operation in 1946, with several others under construction. Nearly 325,000 telephones were in service in 1946.

Banking and Finance.—Louisiana had 33 national banks in 1946, with total deposits of \$1,025,000,000 and resources of \$1,075,000,000; and 122 state banks, with total deposits of \$450,000,000 and resources of \$480,000,000. There were 67 savings and loan associations, with total resources of about \$100,000,000. State budget for the 1945-46 fiscal year: receipts \$120,145,918; expenditures \$107,475,755. State bonded debt approximately \$150,000,000.

Agriculture.—Excessive rainfall during the growing season and shortage of labour and machinery for cultivation materially reduced the yield of some of the principal crops in 1946, the cotton crop being the smallest in 36 years. However, higher prices for most crops and livestock boosted the total agricultural income above that of 1945.

Total value of principal agricultural and truck crops in 1946 was \$238,277,000, compared with \$233,260,000 in 1945; total acreage harvested was 3,552,000, compared with 3,624,000 in 1945. Total cash income from crops and livestock was \$295,000,000 in 1946, compared with \$290,000,000 in 1945; from government payments \$9,500,000, compared with \$12,000,000 in 1945.

Table II.—Leading Agricultural Products of Louisiana, 1946 and 1945

Crop	1946	1945
Cotton (bales)	250,000	395,000
Corn (bu.)	15,936,000	23,140,000
Rice (bu.)	21,508,000	23,028,000
Sugar cane (tons)	4,600,000	5,618,000
Sweet potatoes (bu.)	10,800,000	10,724,000
Irish potatoes (bu.)	2,500,000	2,520,000
Oats (bu.)	3,960,000	4,248,000
Hay (tons)	420,000	400,000
Pecans (lb.)	9,000,000	9,200,000
Peanuts (lb.)	1,780,000	1,785,000
Peaches (bu.)	364,000	422,000
Pears (bu.)	235,000	230,000
Citrus fruits (boxes)	360,000	290,000
Truck crops (value)	\$20,277,000	\$18,260,000

Manufacturing.—The pent-up civilian demand for manufactured products kept many of the larger industries working at wartime level during 1946. Nearly 2,000 industrial establishments, employing 150,000 workers and paying \$200,000,000 in wages, produced finished products worth \$1,000,000,000 in 1946, as compared with \$1,100,000,000 in 1945. Louisiana industries were not materially affected by strikes and labour difficulties in 1946.

Mineral Production.—Civilian demand pushed production of some minerals beyond wartime levels in 1946, though some others dropped below 1945 figures.

Table III.—Principal Mineral Products of Louisiana, 1946 and 1945

Mineral	1946	1945
Petroleum (bbl.)	140,000,000	133,000,000
Natural gas (M. cu. ft.)	600,000,000	550,000,000
Natural gasoline (bbl.)	2,600,000	2,500,000
Sulphur (tons)	925,000	745,000
Salt (tons)	900,000	1,500,000
Shell (tons)	1,440,000	1,500,000
Sand (tons)	1,340,000	1,290,000
Gravel (tons)	2,520,000	2,600,000
Stone (tons)	720,000	800,000

Total value of mineral production was estimated at \$280,000,000 in 1946, compared with \$275,000,000 in 1945. Some new petroleum fields were discovered during the year.

Forest Products, Furs, Fisheries.—Louisiana forests produced 1,000,000 bd. ft. of lumber and 680,000 cords of pulpwood in 1946, compared with 900,000,000 bd. ft. and 640,000 cords in 1945. The 1945-46 Louisiana trapping season yielded 8,869,609 pelts valued at \$15,553,185, compared with 6,521,767 pelts valued at \$7,898,104 for the 1944-45 season. Louisiana fisheries produced catches valued at \$9,603,210 in 1944, \$3,561,022 representing fresh-water and \$6,042,188 salt-water varieties. Though the catches of some varieties were smaller in 1945 and 1946, increased prices brought the total value higher in those years than in 1944.

(W. P. R.)

Lumber. In the United States, lumber continued during 1946 as one of the most critical materials, especially for housing. With the end of World II, it had been expected that the deficiencies in dwelling construction would be promptly made up by the sawmills and that there would be sufficient lumber for housing the home-coming soldiers, as well as for the normal annual construction of dwellings which in former years had been about 800,000 per year.

During the first six months of 1946, however, production of lumber was seriously curtailed in the west due to strikes, lack of skilled labour and difficulty of securing sawmill equipment and supplies. Production in the south and east increased so that the total production during 1946 for the United States was about 32,000,000,000 bd. ft. This was a definite increase over the production for 1945, which had been about 4,000,000,000 bd. ft. less. The increased production, however, was far short of the demand for housing, as well as for increased industrial uses. The increased lumber production was due largely to the following conditions: (1) improved weather in most of the United States and especially for logging in the woods; (2) production from new mills, especially of the smaller capacities; (3) increased production from the older and larger mills, especially those producing from 20,000,000 to 50,000,000 bd. ft. per year; (4) availability of more man power, especially in southern pine and hardwoods of the south and southeast.

Southern pine continued as the leading species produced by the lumber industry, closely followed by Douglas fir and ponderosa pine. These three groups produced approximately two-thirds of the total lumber output of the country. Other important softwoods were white pine (including northern white pine and Idaho white pine), hemlock, both of the western and eastern species, spruce, sugar pine, redwood and southern red cypress. The leading hardwoods produced were oak, red gum,

yellow poplar and hard maple. Other important hardwoods were birch, ash, basswood, hickory, black cherry, tupelo, cottonwood and black walnut.

The year was marked by increasing interest on the part of lumber manufacturers and timber owners generally in improved growing conditions for merchantable timber in the future. It was determined that most of the available standing timber in the United States is found in relatively small ownerships, especially among farmers, in small tracts of approximately 5 to 200 ac. or more each. Industrial ownership of timber represents a relatively small amount of the total. Many lumber companies, as well as other industrial users of standing timber, had recognized the increasing importance of forest management, including better methods of fire protection, improved selective logging, the planting of more trees for the future, the prevention of injurious pests such as insects and fungi which attack trees, and other methods to improve the supply of available timber. This movement was made noteworthy by the American Forestry congress in Washington, D.C., on Oct. 9 to 11, 1946.

Some lumber was exported, principally to Europe and South America, as well as to Central America, but the total amount did not reach the normal quantities of prewar years.

Because of the restrictions of the Office of Price Administration and the very strong demand for all kinds of lumber, considerable lumber found its way into the black market, and for this exorbitant prices were paid. Lumber stocks in retail and distributing yards were lower than at any time after 1900. In some sections of the country, the average stocks carried in retail yards were estimated at 5% of normal.

During World War II, the great demand for lumber was for boxes in which to ship munitions, food and war supplies. The great demand in 1946 was for housing. In spite of encouragement by governmental agencies which dealt with housing, the supply was far short of the demand. (N. C. B.)

Great Britain, Commonwealth and Europe.—It was hoped that by the end of 1946 the grave shortage of timber supplies would be considerably eased, if not entirely overcome. There was, however, no improvement, and the gap between demand and production remained as large as ever. A number of factors contributed to this situation: in most of the producing countries it was not yet possible to get all the labour needed, either in the forests or in the sawmills. The shortage of houses in all European countries not only largely increased the demand for wood, but also prevented several producing countries, notably the U.S.S.R., from exporting their normal quota, as they needed the material to house their own people.

Great Britain's inability to export coal in any quantity undoubtedly affected its power to import timber. Both Sweden and Finland would have produced far more wood for Britain if only they had had adequate coal supplies to drive their sawmills to capacity. The British timber control continued in operation with full control of imports, prices and utilization. In Jan. 1946 the National Softwood Brokers, Ltd., began to operate as a medium of distribution between the government and the trade. Efforts were made to hand back larger parts of the industry to private enterprise as in prewar days, and it was hoped that their results might become still more apparent during 1947.

The over-all Canadian lumber production for 1946 was estimated at 2,600,000 standards, compared with 2,400,000 standards for 1945. The timber control in Canada remained in a modified form. Maximum price schedules were still in force inside the country, but a greater degree of freedom was granted to the export trade during 1946. Canada maintained large shipments of lumber, softwoods and hardwoods to Great Britain, and remained one of Britain's principal sources of supply.

Softwood.—It is estimated that Sweden produced about 1,000,000 standards during 1946, against some 1,450,000 standards in 1938; Finland cut 600,000 standards, against 1,300,000 standards in 1938. The figures for the U.S.S.R., Rumania, Poland and Yugoslavia were not known with sufficient accuracy for estimates to be given, but all undoubtedly produced considerable quantities of softwoods during 1946. Prices continued to show a hardening tendency, and no reduction was expected during 1947: rather the reverse.

Hardwood.—The hardwood supply position in general continued almost as difficult as the softwood in 1946. No important quantities of oak, ash or beech were exported by Russia, Poland, Rumania or Yugoslavia. It was, however, reported that sawmilling operations in the latter two countries were well under way at the end of the year, and a considerably increased volume of production was expected in 1947. Great Britain continued to derive the main part of its hardwood requirements from the U.S., Canada and the West African colonies, combined with an increased production of home-grown timber. Efforts were being made to increase the West African hardwood tonnage by all possible means.

Plywood.—Plywood remained scarce. Of the European countries, Finland resumed its export trade, although still handicapped for supplies of glue and other essential adjuncts. Czechoslovakia operated numerous factories, and planned new plants. No reliable statistics were available from the U.S.S.R., Poland or Rumania, but considerable quantities for home consumption were being manufactured in all three countries. Canada continued to increase its production, and was a large exporter to Great Britain. (See also FORESTS.) (B. L.)

Lutherans. The year 1946 may be marked in the future as an epochal year in the history of the Lutheran Church in the world. The extraordinary circumstances following World War II made it necessary, everywhere, for Lutherans to make an appraisal of the strength, relationships, tasks and resources of the church.

The imperative tasks which confronted Lutherans in the U.S. led that section of the Lutheran Church to recognize the necessity for closer relationships between independent bodies, and that led to a strengthening of their common co-operative agency, the National Lutheran council, to a degree which approached organic union. That agency, which gave such effective service to the men and women in the armed forces during World War II, was implemented for a projection of that service, in peacetime, to men and women who went from war to colleges and universities, or, by the thousands to hospitals for veterans. Likewise, this co-operative program was vastly expanded in the field of missions, home and foreign, and in the field of social service.

The National Lutheran council was designated as the agency through which a fund of \$10,000,000 was sought for 1946 and 1947, for relief and reconstruction in Europe, for a program integrated with the work of the World Council of Churches.

Further co-operation between Lutheran bodies in the U.S. was manifested in connection with the preparation and publication of a hymnal for the use of all Lutheran congregations, and the project of a graduate theological seminary, of university standard, received wide and favourable consideration.

The union of all Lutheran churches in the world in a federation for world service took definite form in a constitution for an organization to be known as the Lutheran World federation.

It is estimated that the membership of the Lutheran Church in the world in 1946 was more than 60,000,000 of whom 3,877,657 were reported as belonging to congregations in North America. Most of the European Lutherans live in Norway,

Sweden, Denmark, Finland and Germany. (See also CHURCH MEMBERSHIP.) (W. H. G.)

Luxembourg. A grand duchy situated between France, Germany and Belgium. Area, 999 sq.mi.; pop. (est. 1942) 301,000; chief city, Luxembourg (cap., 59,000); language, Luxembourgian (idiomatic) and (officially) French and German; religion, 98% Roman Catholic. Ruler from 1919: Grand Duchess Charlotte. The constitution of 1868, with some important changes in 1919, provides for democratic government through a popularly elected chamber of deputies of 55 members.

Economic reconstruction to repair the damages of war was Luxembourg's chief task in 1946. In April a pact was signed with Belgium and the Netherlands looking toward full economic union. In November a claim for a strip of German territory about 2½ mi. wide and totalling about 225 sq.mi. was presented to the Big Four Council of Foreign Ministers. Luxembourg's chief products, with figures for 1938 in metric tons, were: iron ore 5,140,632, pig iron 1,550,703 and steel 1,436,506.

(S. B. F.)

Lynching. As had been feared by close observers of inter-racial tensions, the lynching curve in the U.S. turned sharply upward in 1946, the first postwar year, just as it did in 1919. As against one victim of mob murder in 1945 and two the year before, Tuskegee institute recorded six in 1946, together with four additional borderline cases in which the evidence was not wholly conclusive. All the victims were Negroes and three incidents were involved, one each in Georgia, Mississippi and Louisiana.

Most horrifying of the three—a crime that shocked the nation profoundly—was the multiple lynching near Monroe, Walton county, Ga., in which on July 25 four persons, two of them women, were shot to death. The victims were Roger Malcolm, charged with the nonfatal stabbing of a white man ten days before, Malcolm's wife and her brother and sister-in-law, George Dorsey and wife. On the day of the lynching Malcolm was released from jail on a \$600 bond signed by J. L. Harrison, a farmer, who took the four in his car and started to his home where they were to be employed. Eight miles out of Monroe the car was stopped by some 25 unmasked, heavily-armed men who pulled Malcolm and Dorsey from the car. One of the women screamed and appealed to a member of the mob by name. Thereupon they too were seized and with their hus-

LYNCHINGS in the U.S. from 1882 to 1946, based on figures of the department of records and research, Tuskegee institute

bands were led a little way into the woods, where the four were riddled with bullets. Harrison insisted that he recognized none of the mob. For four months following the crime, a small army of federal investigators worked on the case, combing several counties and interviewing 2,500 people, but apparently without result. A federal grand jury of 23 men, two of them Negroes, then took it up, but after three weeks of hearings announced themselves unable to identify or indict anyone connected with the crime. The judge then recessed the jury, subject to recall should additional evidence come to light.

On July 28, at Lexington, Miss., Leon McTatie, tenant farmer just released from jail where he had been held on a charge of theft later found to be erroneous, was seized by a small group and beaten to death. Five men of the community, accused of the crime by the district attorney, were promptly arrested and indicted, but were acquitted when brought to trial.

In Minden, La., on Aug. 8 John C. Jones, oil worker who had been accused by a woman of trying to enter her house, was released from jail when the woman failed to file formal charges. He was immediately picked up on the street by a small group of men, taken out of town and beaten to death. Six men, including the chief of police and two deputy sheriffs, were indicted by the local federal grand jury on the charge of denying Jones his constitutional rights by "causing him to be released from jail and handed over to a mob." When brought to trial in federal court they too were acquitted.

Stirred by these and other outbreaks of interracial violence, U.S. Attorney General Tom C. Clark announced that he would seek additional legislation to strengthen the government's hand in dealing with such cases, and President Harry S. Truman in December appointed a committee of 15 to study existing federal civil rights laws and suggest measures needed to make them broader and more effective. (R. B. E.)

Macao: see PORTUGUESE COLONIAL EMPIRE.

MacArthur, Douglas (1880—), U.S. army officer, was born Jan. 26 in Little Rock barracks, Ark. (See *Encyclopædia Britannica*.)

Following Japan's attack on the Philippines he was renamed a full general by President Roosevelt, Dec. 19, 1941, and led Filipino and U.S. forces in the defense of the islands. Although heavily outnumbered in men and material, MacArthur slowed the Japanese advance and retired to the Bataan peninsula. He left the Philippines on Roosevelt's orders and reached Australia on March 17, 1942, to assume command of the United Nations' armies in the Southwest Pacific.

In opening the campaign in New Guinea in the fall of 1942, MacArthur took the offensive against the Japanese and never relinquished it throughout the remaining years of World War II, conquering New Guinea and liberating the Philippines. He was promoted to the rank of general of the army (Dec. 15, 1944).

After Hirohito's surrender broadcast (Aug. 14, 1945, U.S. time), President Truman appointed MacArthur supreme commander of Allied occupation forces in Japan. The general headed the Allied delegation that accepted the Japanese surrender, Sept. 2, 1945, aboard the battleship U.S.S. "Missouri" in Tokyo bay. He was not in favour of the Big Three's agreement to establish an Allied Control council for Japan, but he asserted (Dec. 30, 1945) that he would try to make the plan work regardless of its "merits or demerits."

The general's early reports on the results of the occupation policy were somewhat gloomy and marked with concern over the growth of the Communist party in Japan. Subsequently, they became more optimistic and on Dec. 31, 1946, he stated that Japan had made "major advances" toward establishing a

liberal social system and he praised Japanese leaders for their "exemplary approach to the realism of Japan's problems."

It was generally acknowledged that MacArthur's occupation policies were satisfactory to the state department and to President Truman.

Some British critics complained, however, that MacArthur was the advance agent of U.S. "imperialism" and that his control of Japan was virtually absolute.

McGill University. Under the royal charter which established McGill university (Montreal, Que.) in 1821 the governor general of Canada was appointed visitor on behalf of the crown. In May 1946 the university had the honour of welcoming as its new visitor the incoming governor general, Field Marshal Viscount Harold Alexander of Tunis, and later in the year of conferring the honorary degree upon Field Marshal Viscount Bernard Montgomery of Alamein.

During the year the veterans of World War II returned to the university in great numbers. From a normal enrolment of 3,000 the student body rose to 7,500 late in October. The university remained in almost continuous session throughout the year, admitting students three times, in January, the end of May and October. To meet the emergency an R.C.A.F. station 30 mi. outside the city was taken over and named Dawson college. Another R.C.A.F. station was acquired at Lachine, Que., where the Peterson residences provided quarters for married and single veterans who commuted for classes to the Montreal campus; several new student residences were constructed at Macdonald college. Other new buildings included the completion of the first cyclotron and radiation laboratory in Canada and the enlargement of the existing engineering building. Total gifts, grants and bequests received during the year reached a total of \$2,021,205. The expenditure was \$3,867,852 which was more than \$1,500,000 greater than the previous year.

(For statistics of endowment, enrolment, faculty, library volumes, etc., see also UNIVERSITIES AND COLLEGES.) (F. C. J.)

Machinery, Farm: see AGRICULTURE.

Machinery and Machine Tools. The value of machine tools shipped from builders' plants in the United States during 1946 totalled a little more than \$300,000,000. This brought the total for the ten years from 1937 through 1946 to more than \$5,459,000,000, a sum considerably greater than for any decade in the history of the industry. Shipments for the 1927-36 decade were only \$862,000,000.

The 1946 total was about 75% of the more than \$497,000,000 total for 1945, and only about 23% of the \$1,320,000,000 peak total attained in 1942. It is of interest to note that shipments by the United States machine tool industry during the five World War II years of 1941 through 1945 totalled more than \$4,179,000,000, almost 12% more than the 40-year total of \$3,649,000,000 produced from 1901 through 1940. Total shipments during the five World War I years of 1914 through 1918 were a little more than \$669,000,000, less than one-sixth of the 1941-45 total.

Values given are for nonportable power operated units, valued at \$350 or more each, used to shape parts by progressively removing metal in the form of chips. Machines for drilling, turning, boring, grinding, milling, threading, broaching, honing and similar operations are included. Not included are metal forming units—presses, forging machines and hammers, extruding machines, brakes and shears—for which comparable totals were not available.

New records were set during 1946 by makers of mechanical

presses in the United States. Shipments reached an all-time high of \$4,700,000 during the month of August. Also busy during 1946 were makers of hydraulic presses, heat-treating furnaces and materials handling equipment.

High production requirements in many metalworking plants led to the construction of a number of special-purpose machine tools by U.S. builders. Perhaps the most unusual of these was a 24-station transfer type machine designed to process cast iron refrigerator-compressor bodies in a predetermined machining cycle. At 80% efficiency, this machine produces 188 pieces per hour. Two compressor bodies are loaded on each work-holding fixture and duplicate operations are performed simultaneously. Milling, drilling, boring, reaming, chamfering and tapping operations are performed with 152 tools. All functions of the machine are hydraulically operated and electrically interlocked. The individual machine units must go through their complete cycles before the fixtures can be released and the transfer bar operated. Similarly, all fixtures in the machine must be transferred and clamped properly before the next machining cycle can be started.

Of equal interest to production engineers in mass-production plants was the development during 1946 of a precision pneumatic gauging instrument arranged for checking simultaneously bore diameters of automotive engine cylinder blocks. Designed for installation as an integral part of a production line, this unit checks diameter, taper and out-of-roundness of eight cylinder bores at four different points in each cylinder, and accurately classifies them to 0.0003 in. Hydraulically operated and electrically controlled, this unit can complete a gauging cycle on a cylinder block in less than 60 seconds.

For the most part, designs of general-purpose machine tools were frozen during World War II in order that quantity production of needed units could be achieved with less difficulty. Major design changes were deferred until the battle of production could be won. The year 1945 therefore was the first after the war started when machine tool builders could put design engineers to work on new units. Their work was evidenced by the number of new machines announced by U.S. machine tool builders during 1946.

Outstanding among these new machines was a line of powered headstocks and powered toolslides developed for turning, boring and facing operations on rotating workpieces. Developed as a result of functional analysis of the engine lathe, these units can be combined in a number of arrangements to facilitate application of single-point tools to the rotating work. The machine consists of two members—a simplified lathe headstock and base with drive motor, change gears and associated controls; and from one to three individually motor-driven toolslides mounted on swiveling bases. The toolslides have automatic feed cycle controls which provide rapid approach and return at 100 in. per min. and predetermined feed at rates of 0.5 to 13 in. per min. Some of the slides have automatic tool relief. Heads and slides can be mounted on a common base to perform consecutive operations controlled by one operator, or single-head units on compact bases and fitted with one or more slides can be grouped for servicing by one operator.

Of more conventional design, a dual-drive lathe introduced late in 1946 swings 15-in. over the bed ways and is powered with a 3-h.p. motor. There are 12 spindle speeds available, 8 in the low-speed range where the drive is through a gear train, and 4 in the high-speed range with direct belt drive from the motor to the spindle. Low speeds range from 28 to 445 r.p.m.; high speeds for use with carbide tools range from 540 to 1,800 r.p.m. A single lever controls all 12 speeds.

Cams were eliminated in a series of five-spindle automatic screw machines for operations on bar stock made available early

in 1946. Normal cam functions are performed by adjustable quadrant sectors and links that control feed strokes. Four independent cross slides, a separate cutoff slide, a longitudinal centre slide and two independent longitudinal slides provide for flexibility of tooling arrangements. An 18-speed transmission controls rate of feed of all tools. Spindle speed range is 130 to 1,414 r.p.m. in 24 steps. Depending on work requirements, drive is from a 10 or 15 h.p. motor.

Pre-selected changeable spindle speeds ranging from 50 to 5,000 r.p.m. were featured in a high-production hand screw machine also announced in 1946. Spindle bore will accommodate bar stock up to $\frac{7}{8}$ in. diameter. It has a power-feed ram turret and a hand-operated cutoff slide. A 3-h.p. variable-speed motor, complete with motor-generator set for converting alternating to direct current, is used to drive the machine. All electrical controls, including speed-control potentiometers, are mounted on an enclosed panel at the rear of the machine. This ten-station panel has six speed-control stations for the six sides of the turret, two stations for the front and rear tools on the cutoff slide, and two additional speed control stations for other operations such as forward or reverse speed for tap and die work. Return of a tool from the work position actuates a finger which automatically changes spindle speed to that required for the next operation in the pre-set cycle.

A new boring and turning mill for railway car wheels ranging from 33 to 40½ in. diameter made it possible to reduce time for boring and contour turning operations materially. Chucking method centres the wheel so rim thickness is balanced when machining operations have been completed. Four heads used include the boring and facing head, the rim turning head and two side heads. Automatic cycling is provided for all heads,

ROUGH FORGING of the shaft for a 100,000 kilowatt turbine generator under construction during 1946 at the General Electric plant at Schenectady, N.Y. The shaft, 75 ft. long when finished, was to operate at 3,600 r.p.m.

which have individual feed motors. The 100-h.p. main drive motor provides a table speed of 5 to 25 r.p.m. Both side heads have contour attachments so the taper and contour on the tread and flange of the wheel can be generated. This produces finer finishes and greater accuracy than was possible with the previously used plunge cut method.

Development of a two-element unit for measuring and correcting unbalance in crankshafts for automobile engines was another important 1946 announcement. Combining an electronically controlled balancing machine and a six-spindle drilling machine, the unit makes it possible to balance six-throw crankshafts to a high degree of accuracy with little possibility of human errors affecting the results. The two machines are interconnected electrically so the balancing unit measures correction to be applied at each of six points on the crankshaft and these measurements are transmitted to the drilling unit so stops can be set automatically. The crankshaft then is moved on a dolly from the balancer to the drill press and is transferred to a locating fixture. With the fixture closed, a pushbutton is operated to start the drilling cycle. Depth of each hole is controlled to within 0.003 in. of the setting predetermined by the balancing unit without attention from the operator. Average time per crankshaft is about two minutes. (B. C. B.)

Great Britain.—The British machine tool industry played an important part in the reconversion and export programs during 1946. The minister of supply established the Machine Tool Advisory council which, with its government, machine tool and independent representation, provided a permanent means of consultation.

The value of production of metalworking machine tools in Great Britain in 1935 was £6,500,000; by 1939 it was £16,000,000, and in 1942 reached a peak of £33,000,000. During World War II 385,000 or 82% of the new tools installed in British factories were British made. The peak output, which was achieved by shift working and widespread sub-contracting, and with a total labour force of about 50,000, indicated the inherent strength and flexibility of the industry. Production for 1945 was about £20,000,000. Order books were heavily loaded in 1946, the value of outstanding orders representing about 15 months' work at the existing production rate. Output was limited by the supply of skilled labour and particularly by the lack of castings and electric motors.

In 1932, due largely to Russian orders, exports reached about 75% of total production. In 1946 deliveries for export were expected to reach £8,000,000 or 40% of production.

A large surplus of government tools became available at the end of the war. These were offered in the first instance to home users, to stimulate and facilitate the re-equipment of industry. Up to Sept. 1946 63,000 machines had been sold at a total price of £17,200,000 and by far the greater part of these replaced older and less efficient machines or increased production facilities in British factories. Due to the heavy demand, new production was not endangered by the rapid release of the surplus.

Great technical progress was made under the stimulus of war and many types previously imported were developed and perfected, including small precision machines of the Swiss type for instrument manufacture, three-dimensional cam milling machines, large presses and high production automatic lathes. (See also AUTOMOBILE INDUSTRY.) (S. F. SD.)

Mackenzie King, William Lyon: see KING, WILLIAM LYON MACKENZIE.

McNarney, Joseph Taggart (1893—), U.S. army officer, was born Aug. 28 in Emporium, Pa. He was graduated from the U.S. Military

academy, West Point, N.Y. (1915), and served with the U.S. air forces in France, 1917–18. He was graduated in 1926 from the Command and General Staff school at Fort Leavenworth, Kan. He was a member of the Roberts commission that investigated the Pearl Harbor attack (Dec. 1941–Jan. 1942), and in March 1942 he was appointed deputy chief of staff. In May of the same year he was made a lieutenant general. McNarney left his desk job in Oct. 1944 to become deputy supreme Allied commander in the Mediterranean. Pres. Roosevelt named him (March 13, 1945) for promotion to the temporary rank of a full general. When Gen. Dwight Eisenhower was elevated to the post of chief of staff, McNarney succeeded him as commander of U.S. forces in Europe (Nov. 20) and concurrently of German occupation forces and U.S. representative on the control council. He said (Nov. 27, 1945) that he would adhere to a strict denazification policy.

McNarney warned (May 8, 1946) that the food crisis and Allied failure to administer Germany as an economic entity imperilled "all phases" of the occupation. On Dec. 4, he ordered abolition of the army's "hate-the-Germans" policy and directed occupation forces to help the reich rebuild its economy and regain political freedom. Three weeks later (Dec. 24), he announced an amnesty for more than 800,000 Germans in the U.S. zone who were facing prosecution under the denazification laws. McNarney, who was slated to become U.S. representative on the United Nations military staff committee, relinquished his post in Germany to Gen. Lucius D. Clay, Jan. 6, 1947.

McNutt, Paul Vories (1891—), U.S. politician and government official, was born July 19 in Franklin, Ind. Educated at Indiana university, Bloomington, Ind. (A.B., 1913), and at Harvard, Cambridge, Mass. (LL.B., 1916), he served on the faculty at Indiana university law school, 1917–25, and was dean of the law school, 1925–33. He became governor of Indiana in 1933. He was U.S. high commissioner to the Philippines, 1937–39, and was named first administrator of the Federal Security administration in 1939. On April 18, 1942, President Roosevelt made McNutt head of the War Manpower commission. In an effort to correct "wastage" of federal manpower and the pirating or hoarding of workers, Pres. Roosevelt on Dec. 5, 1942, vested in McNutt full authority to hire and distribute workers for civilian war industries and full control of the Selective Service system. In Dec. 1943 a new draft bill was enacted which deprived McNutt of his power over selective service. President Truman appointed him high commissioner to the Philippines on Sept. 6, 1945.

On June 14, 1946, McNutt was named the first U.S. ambassador to the Philippines and he took his post July 4 when the Philippines republic was formally established.

McReynolds, James Clark (1862–1946), U.S. jurist, was born on Feb. 3 at Elkton, Ky., and was educated at Vanderbilt university, Nashville, Tenn. (B.S., 1882), and at the University of Virginia, Charlottesville, Va. He was graduated from the law department of the latter school in 1884. In 1903, he became the U.S. assistant attorney general and a celebrated "trust buster." In this capacity, he handled the prosecution of Sherman act violations and presided over the dissolution of the tobacco and anthracite trusts. Appointed attorney general in 1913, his tenure was highlighted by the dissolution of the Pacific-Southern railroad merger and by the ruling that compelled the American Telephone and Telegraph company to relinquish its monopolistic control of wire communications. In 1914, he became an associate justice of the supreme court, and held this position until he retired on Feb. 1, 1941. As supreme court justice, he par-

anticipated in many celebrated cases. In 1929 he wrote the majority opinion in the case that preserved the five-cent fare in New York city, and in 1932 he dissented when the court ordered new trials for the seven Negroes in the Scottsboro case. In the years that followed, Justice McReynolds became famous as a court dissenter and as a sharp critic of Pres. Roosevelt's New Deal. A dissenter in the renowned gold-clause decision, which held that gold payment of private bonds could not be enforced, he denounced the majority opinion, describing it as a "repudiation of national obligation." At times the lone dissenter of the court, he attacked the Tennessee Valley authority project, holding it unconstitutional in the suit over a contract for transmission of energy. A staunch advocate for the "written constitution" and the "indestructible states," he waged a long and stubborn fight against an expanding federal program. He died at Wash., D.C., on Aug. 24.

Magnesium. Under pressure of extraordinary demand, magnesium production made a record that is an outstanding example of what can be accomplished when necessity drives. The progress of the industry in the United States is shown in the table.

Data of Magnesium Industry in the U.S., 1939-45

	1939	1940	1941	1942	1943	1944	1945
	(In thousands of short tons)						
Primary output	3.4	6.3	16.3	49.0	183.6	157.1	32.8
Secondary recovery	?	?	?	6.3	11.4	14.2	9.2
Sales, primary	5.3	6.4	15.5	47.4	170.3	146.6	43.5
Exports	2.1	0.8	1.5	4.0	35.6	21.0	0.5
World output (est.)	34.1	40.3	72.1	131.4	283.7	264.4	60.6

The 1945 output was made by four government-owned and three private plants but by the end of the year only the Dow Chemical company was operating.

In the course of only a few years magnesium shifted from a minor metal to a major one, with a plant capacity in the U.S. alone that totalled 293,000 tons. In 1939 uses of the metal were largely in the experimental stage. Some of the war uses were expected to be made the basis of later civilian uses, but the problem of disposal of surplus plant capacity of this magnitude was a difficult one. There were 13 government-owned plants, of which it had been recommended that 7 be disposed of for other uses, and 6 with an annual capacity of 106,000 tons, be sold or leased as operating plants, or held in stand-by condition.

Canada built up a small war production, amounting to 3,577 short tons in 1943, increasing to 5,290 tons in 1944 and dropping back to 3,726 tons in 1945. (G. A. Ro.)

Magnesium Compounds. Formerly produced from crude magnesite, magnesia is now derived from a variety of raw materials—magnesite, bruceite, dolomite, sea-water bitterns, raw sea water, dry-lake brines and well brines.

Other magnesium compounds, mostly the chloride, with smaller amounts of sulphate and precipitated carbonate, formerly from well brines, now come from the same sources as the magnesia output.

Production of the major types of magnesium compounds in the United States, in short tons, is shown in the table.

The increasing degree to which other sources supplemented crude magnesite in the production of magnesia is indicated by the ratio of the total magnesia output to that of crude; this ratio rose from 48% in 1939 to 88% in 1945. Most of the increased output of caustic calcined magnesia was used in the

Production of Magnesium Compounds in the U.S.

	Crude Magnesite	Caustic Calcined	Refractory	Total Magnesia	Other Compounds	Dead-burned Dolomite
	(short tons)					
1937	203,473	10,031	83,204	93,235	64,777	617,706
1938	97,000	7,400	38,738	46,138	70,733	366,626
1939	198,980	10,157	86,077	96,234	85,754	671,561
1940	333,166	16,261	140,668	156,929	108,266	867,909
1941	374,799	30,225	201,481	231,706	137,357	1,069,887
1942	497,368	41,889	273,661	315,550	296,885	1,229,357
1943	754,832	191,792	301,382	493,174	737,062	1,276,725
1944	561,450	139,243	278,490	417,733	608,151	1,290,790
1945	336,458	43,270	254,994	298,264	201,501	1,187,334

production of metal while refractory magnesia went into metallurgical furnaces, mostly steel, partly for expanding output and partly replacing imports.

Dead burned dolomite also went into the steel industry, supplementing magnesia in furnace bottoms.

Increases in production of magnesium compounds other than magnesia were mainly for the chloride, used in the production of metal. The cutback in the war demand for magnesium was reflected in the sharp decline in demand for caustic calcined magnesia and other magnesium compounds in 1944 and 1945.

(G. A. Ro.)

Maine. The extreme northeastern state of the United States, admitted as the 23rd state in 1820, and popularly known as the "Pine Tree state." Land area 31,040 sq.mi.; water area 2,175 sq.mi.; pop. (1940) 847,226; rural 504,169; urban 343,057. Capital, Augusta (19,360). Other cities: Portland (73,643); Lewiston (38,598); Bangor (29,822). The U.S. bureau of the census officially estimated the population of the state at 793,600 on July 1, 1944.

History.—Governor Horace A. Hildreth was re-elected in the September election for the 1947-48 term. Republicans retained control of the 151-member house and the 33-member senate. Five Republicans served in congress: Robert Hale (1st district); Margaret Chase Smith (2nd district); Frank Fellows (3rd district) in the house; Wallace H. White, Jr., and Owen Brewster in the senate. All congressional terms expiring in 1946 were filled by re-election of the incumbents (Hale, Smith, Fellows, Brewster). A sales tax-soldier's bonus measure enacted at a special session of the state legislature was defeated by referendum vote.

Education.—Teacher shortages forced about 100 Maine schools to remain closed in the fall of 1946. About 500 teachers were allowed to work on permits and sanctions, even though not fully qualified according to desirable standards. The net enrolment in the public schools for 1944-45 was 153,318, compared with 152,788 for 1943-44. There were 5,836 teaching positions (1944-45), compared with 5,703 for the year 1943-44. Harry V. Gilson was commissioner of education in 1946, resigning as of Dec. 31.

Social Insurance and Assistance, Public Welfare and Related Programs.—As of June 30, 1946, there was a balance in the Maine unemployment compensation fund of \$36,681,291, a decrease of \$259,060 from the first of the year, but larger than any previous June 30 balance.

Public assistance funds expended during the two fiscal years ending June 30, 1946, were as follows: old-age assistance (1946) \$5,438,756, (1945) \$5,134,189; aid to dependent children (1946) \$1,210,530, (1945) \$952,799; aid to blind (1946) \$299,969, (1945) \$293,772. November case loads in the above categories were: old-age assistance (Nov. 1946) 15,228, (Nov. 1945) 14,891; aid to dependent children (Nov. 1946) 4,854, (Nov. 1945) 3,921; aid to blind (Nov. 1946) 772, (Nov. 1945) 806.

Thirteen state institutions (correctional, insane hospitals, sanatoria) with their inmate populations as of Nov. 30, 1946, and appropriations for the 1946-47 fiscal year, were as follows:

Augusta state hospital, Augusta, 1,537 inmates, \$677,593; Bangor state hospital, Bangor, 1,173 inmates, \$544,000; Pownall state school, Pownall, 1,079 inmates, \$530,000; Central Maine sanatorium, Fairfield, 146 inmates, \$249,504; Northern Maine sanatorium, Presque Isle, 89 inmates, \$145,000; Western Maine sanatorium, Hebron, 98 inmates, \$180,000; Maine state prison, Thomaston, 373 inmates, \$215,000; Re-

formatory for Men, South Windham, 78 inmates, \$100,000; Reformatory for Women, Skowhegan, 120 inmates, \$120,000; School for Boys, South Portland, 130 inmates, \$125,000; School for Girls, Hallowell, 138 inmates, \$130,000; Maine School for the Deaf, Portland, 91 inmates, \$64,785; Military & Naval Children's Home, Bath, 40 inmates, \$27,020; the total inmate population was 5,092; the total appropriation was \$3,107,902.

Communications.—The total mileage of the state's highways as of June 30, 1946, was 21,958. Total income for the fiscal year ending June 30, 1946, was \$11,501,428 (of which 50% came from state gasoline tax); expenditures were \$10,384,113 (including bond interest of \$539,330, and bond retirement of \$1,761,600). Steam railroad mileage in the state (1946) was 2,778 mi. During 1946 (to Dec. 1) there were 259,975 motor vehicles licensed in the state, with 304,723 operators' licences issued in the same period.

Banking and Finance.—During 1946 the Maine banking department (Homer E. Robinson, commissioner) supervised 32 savings banks with 2 branches, 30 trust companies with 56 branches and agencies, 32 loan and building associations. The assets of savings banks, trust companies and building and loan associations of June 29, 1946, were \$534,472,254 with total deposits of \$457,515,051. Assets of the same institutions a year earlier were \$463,824,810. No state bank failed in Maine after 1933, and assets and deposits reached an all-time high mark in 1946. The 33 national banks in Maine reported to the comptroller of the currency total assets of \$263,084,000 as of June 30, 1946.

State receipts, expenditures and bonded debt for the fiscal year ending June 30, 1946, were respectively: \$37,757,518; \$35,700,261; and \$16,413,500. For the year ended June 30, 1945, they were respectively: \$42,101,841; \$31,489,219; and \$19,052,500. (In 1945 the controller included revenues and expenditures of the unemployment compensation fund and certain other funds which are not included in 1946 figures.)

Agriculture.—Production of the leading crops during 1945 and 1946 is given in Table I.

Table I.—Leading Agricultural Products of Maine, 1946 and 1945

Crop	1946 (est.)	1945	Average, 1935–44
Corn, bu.	407,000	429,000	594,000
Wheat, bu.	21,000	19,000	64,000
Oats, bu.	2,840,000	2,627,000	3,837,000
Barley, bu.	128,000	87,000	114,000
Buckwheat, bu.	120,000	93,000	813,000
Hay, short tons	844,000	935,000	813,000
Potatoes, bu.	77,745,000	54,549,000	45,788,000
Apples, bu.	704,000	132,000	648,000
Beans (dry), tons	2,450	1,650	4,250

Manufacturing.—The total value of manufactures (1939 census) was \$345,368,595. Total employment was 81,995 and wages paid \$82,026,503.

Table II.—Principal Industries of Maine, 1939 and 1937

Industry	1939	1937
Boat and shoe	\$46,162,403	\$42,568,005
Cotton mill	28,342,860	28,937,439
Woolen mill	36,118,681	28,409,949
Pulp and paper	25,370,932	28,890,516

Mineral Production.—The leading mineral products of Maine included slate, granite, clay (chiefly for bricks), sand, stone and gravel (the last

Table III.—Value of Principal Mineral Products of Maine, 1944, 1943

	1944	1943
Beryllium ore	\$ 257	\$ 169
Clay products	120,000
Feldspar (crude)	47,892	41,652
Mica—sheet	40,803	63,845
Mica—scrap	1,602	5,862
Peat	80,732	60,033
Sand and gravel	710,047	733,503
Silica	203	840
Stone	332,736	409,780
Miscellaneous	932,131	1,284,761
Total (eliminating duplication)	\$2,146,000	\$2,720,000

three chiefly for highway construction), cement, lime, feldspar, mica and peat. Maine also produced tourmalines and other semiprecious stones. (E. F. D.)

Maize: see CORN.

Makin, Norman John Oswald (1889–), Australian statesman, was born March 31, at Petersham, New South Wales. He left school at an early age and worked as delivery boy, bookseller and pattern-maker. He joined the Labour party, was elected in 1919 to the Australian house of representatives, was speaker of the house from 1929 to 1932 and became president of the Labour party in 1936. Makin, who was a member of the Advisory War council in 1940, was appointed minister of the navy and munitions in John Curtin's cabinet, Oct. 1941. He was given the additional portfolio of minister of aircraft production in 1945.

Makin headed the Australian delegation that attended the United Nations Security council sessions in London. On Jan. 15, 1946, he voiced the opinion that the atomic bomb should be placed at the disposition of the Security council's projected po-

lice force. He was elected president of the Security council under the alphabetical rotation plan on Jan. 17, 1946.

Malaya, British: see MALAYAN UNION AND SINGAPORE.

Malayan Union and Singapore. In 1946 the Straits settlements, Federated Malay states and Unfederated Malay states of British Malaya were organized into two political divisions, the Malayan union and Singapore. The Malayan union includes the Federated and Unfederated Malay States and three of the former Straits Settlements, Penang, Labuan and Malacca. The Federated Malay States were four in number: Perak, Selangor, Negri Sembilan and Pahang. The Unfederated Malay States included Johore, Kedah, Kelantan, Trengganu and Perlis. Each of these states continues to have its own native ruler with powers restricted to matters of the Mohammedan religion. The new organization extends the principle of federation to the formerly Unfederated States. A governor appointed by the British crown is the chief executive of the Malayan union. He is assisted by an executive council and by a central advisory council of Malay rulers. The legislative council of the Malayan union is the law-making body in matters of concern to all of the states. Members of all three councils are appointed by the governor. In local state affairs, administrative and legislative power is vested in a state council appointed by the British resident. The native rulers and the Malay advisory council, appointed by the ruler, may legislate on matters of religion only. The rulers enjoy their position by hereditary right. Legislation passed by these native councils is subject to the approval of the governor of the Malayan union.

Singapore, formerly a part of the Straits Settlements, was made a crown colony. The Cocos-Keeling Islands and Christmas Island are a part of the crown colony of Singapore. Executive powers are vested in a British-appointed governor. The governor appoints an executive council and a legislative council.

The revised government of British Malaya includes a change in the rules of citizenship. Formerly a person born in a Malay state was a citizen of that state. Persons born in the Straits Settlements were British subjects though not British citizens. With the change in government all persons born in Malaya are citizens of the Malayan union. Governor-General of Malayan union and Singapore (1946): Malcolm MacDonald. Governor Malayan union: Sir Edward Gent; governor Singapore: F. C. Gimson.

People.—In 1941 the Straits Settlements had a population of 1,435,895 of whom 315,629 were Malays, 18,101 Europeans, 13,540 Eurasians, 927,003 Chinese and 148,851 Indians. Out of a population of more than 4,000,000 in the Malayan union, there were more than 1,700,000 Chinese.

Trade and Communications.—Statistics for the Malayan union and Singapore are given in terms of the dollar (equivalent to 47.51 U.S. cents in 1941) established as the unit of currency in 1938 and in pounds sterling. In 1940 imports in the Straits Settlements were valued at £96,146 and exports at £131,257. Imports in the Federated Malay States were £17,577,610 and exports (including re-exports) £50,432,246. Imports in the Unfederated Malay States were £57,275,959 and exports £138,214,062. The United States department of commerce reported that imports from British Malaya for the first nine months of 1946 were \$72,429. Exports of rubber from Singapore and the Malayan union in Aug. 1946 amounted to 76,649 long tons.

In 1940 the Straits Settlements had 1,073 mi. of metalled roads and 133 mi. of gravel roads, natural roads and hill paths. The Federated Malay States had 3,108 mi. of metalled roads and 198 mi. of unmetalled roads. The Unfederated Malay States had a total road mileage of 2,047.

A railroad connects the city of Singapore with Bahru, the southernmost city on the peninsula. Malacca, a city on the coast, is connected by railroad with the city of Negri Sembilan in the interior. A third railroad runs from Parit Buntar in Krian to Prai in Province Wellesley. Telephone and telegraph communication exists throughout the Malayan union and Singapore.

Education.—Enrolment in the government English and vernacular schools in the Straits Settlements in 1940 was 38,604, in the grant-in-aid schools 44,474. English schools in the Federated Malay States had an enrolment (1940) of 19,505, vernacular and registered schools 121,865.

Finance.—In 1940 revenue in the Straits Settlements was £5,736,803 and expenditures £6,926,656; in the Federated Malay States revenue was £11,493,060, expenditures £9,166,203.

Agriculture and Mineral Production.—Of the 5,000,000 ac. under cultivation in 1940, 3,297,000 ac. were devoted to rubber and production totalled 540,000 tons, approximately 40% of world production. Almost 70% was produced on large plantations (more than 100 ac.) and approximately 75% of these were European-owned. About 727,000 ac. were devoted to rice cultivation. The rice crop is not sufficient to meet local demands. Copra, oil palm products and pineapples are exported in considerable quantities.

Out of a total mineral production of £13,700,000 in 1939, tin ore was by far the most important, accounting for £10,900,000. In 1940 Malaya produced 33.2% of the world's output. The smelting of tin is an important industry. In addition to the tin ore mined in Malaya, much of the tin ore produced in neighbouring countries is smelted there. In 1939 production of other minerals included 1,940,000 tons of iron ore, 84,400 tons of bauxite, 31,500 tons of manganese, 174,300 tons of phosphates and 514 tons of tungsten.

Malta: see MEDITERRANEAN, BRITISH POSSESSIONS IN THE.

Manchuria. A large area including the three northeastern provinces of China (Fengtien, Kirin and Heilungkiang), bounded N. and E. by soviet Siberia, W. by soviet Siberia, Outer Mongolia and China, S.E. by Korea. Area 503,143 sq.mi.; population (1940) 43,233,954, excluding area of 1,338 sq.mi. and population of 1,225,570 in the Kwantung Leased territory, now a part of Manchuria. Population (1939) 39,454,026, including 37,581,000 Manchurians, 1,162,000 Koreans, 642,300 Japanese and 67,700 of other nationalities.

Largest cities (1940) were Mukden (1,135,801), Harbin (661,984), Changchun (called Hsinking by the Japanese) (554,202), Antung (315,242) and Fushun (269,919). The principal religions of Manchuria at the end of 1938, in the order of number of believers, were Buddhism, Taoism, Lamaism, Mohammedanism and Christianity.

History and Government.—Japanese control over Manchuria was ended and the state of Manchoukuo eliminated upon Japan's unconditional surrender on Aug. 14, 1945. Five days earlier, soviet military forces had entered Manchuria and by the end of August occupied a large part of the country. Under the terms of the Cairo declaration of 1943, it was agreed that Manchuria would revert to Chinese sovereignty. A Sino-Soviet treaty, signed in Moscow on the day Japan surrendered, recog-

CHINESE who fled Manchuria during the Japanese occupation, clamber aboard a train heading back toward Mukden, in 1946

nized the sovereignty of the Chinese National government over Manchuria. The treaty also gave the soviet union economic concessions in Manchuria, and provided for joint ownership of the Chinese Changchun railway and joint use of Port Arthur as a naval base. In addition it established Dairen as a free port with parts of the harbour to be assigned to the soviet union, but with China to administer the port.

The soviet union agreed originally to withdraw its forces from Manchuria by Dec. 3, 1945, but this date was later extended to March 3, 1946. Soviet troops were withdrawn from Manchuria during the early part of 1946, except for the southern tip of the Kwantung peninsula, including Port Arthur and Dairen, which at the end of 1946 was still soviet controlled. However, Chinese Communist forces entered Manchuria from North China at about the time of the withdrawal of the soviet troops, and hostilities between Chinese Nationalist and Chinese Communist troops began. By Dec. 1946 the Chinese National government held the entire southern coast line, except Port Arthur and Dairen, and a salient extending inland to a point between Changchun and Harbin. Chinese Communist forces held most of the rest of Manchuria.

Education.—In 1939 there were 15,877 primary schools with 1,589,169 pupils and 37,639 teachers; 238 middle schools with 54,768 students and 2,768 teachers; 40 normal schools with 8,014 students and 520 teachers; and 13 institutions of higher education with 3,820 students.

Finance.—Monetary inflation became severe in Manchuria during 1946. The Manchoukuan yuan, Japanese puppet currency, was circulating in addition to soviet occupation roubles and new Manchurian notes issued by both Chinese National and Chinese Communist authorities.

Trade and Communications.—Manchuria had virtually no external trade in 1946. In 1939 Manchuria had total exports in Manchoukuan yuan of 835,000,000 and imports of 1,800,000,000 yuan. (In 1939 the Manchoukuo yuan = 23.65 U.S. cents.) There were about 6,710 mi. of railways in 1940 and about 30,000 mi. of highways, of which 13,000 mi. were suitable for traffic.

Agriculture.—Manchuria is a food surplus area. The chief food crops are millet, kaoliang, maize and soybeans. 1946 crops were above average owing to favourable weather conditions. In 1940, the country produced 16,100,000 tons of cereals, 4,200,000 of soybeans, 2,100,000 of potatoes, and 75,000 bales of raw cotton. There were 1,683,000 cattle, 2,000,000 sheep, 1,250,000 goats and 2,000,000 horses in 1937. Rice production in 1946 was estimated at 15,000,000 bushels, about one-third of the prewar average.

Industry.—Under Japanese domination, Manchuria was developed into a strong industrial area to supplement Japanese war industry. As a result of military hostilities between Chinese Communist and Nationalist forces and removal of industrial equipment by soviet forces, the Manchurian economy during 1946 was chaotic. A survey by Ambassador Edwin W. Pauley of losses to Manchurian industry

because of removals and damage revealed that the estimated reduction of capacity during 1946 was 71% in the electric power industry, 50% to 100% in phases of the iron and steel industry, 80% in the metal-working industry, 75% in nonferrous mining, 65% in liquid fuels and lubricants, 50% in the cement industry, 50% in the chemicals industry, 75% in the textile industry, and 30% in the paper and pulp industry. Estimated annual industrial capacity in short tons at the end of 1946 included: iron ore, more than 2,000,000; pig iron, less than 500,000; ingot steel, about 650,000; rolled steel, about 300,000; coal, less than 3,000,000; cement, more than 1,000,000. (S. Nk.)

Mandated Pacific Islands: see PACIFIC ISLANDS, MANDATED.

Mandates. The mandates system as such came to a close with the last League of Nations assembly in April 1946, although its smooth supercession by the United Nations trusteeship system and council, incorporating the additional idea of social and economic partnership with the people concerned, was delayed. When the general assembly met in London, the voluntary agreements between the nations concerned and the United Nations, without which the trusteeship council could not be created, were not forthcoming, although several of the states administering mandated territories declared their intention of negotiating such agreements.

This intention was reiterated at the final League of Nations assembly in April. Great Britain, France, Belgium, Australia and New Zealand were all taking steps to bring their mandated territories under the new system. A different line was taken by the Union of South Africa, which claimed that South-West Africa, already administered under the mandate as an integral part of the Union, should be internationally recognized as such. For the meantime, however, all mandatory states stressed the fact that their territories would continue to be administered in the spirit and the letter of the League mandates. Trans-Jordan was recognized by Great Britain as an independent kingdom in March 1946 and a treaty of alliance signed between the two countries; Emir Abdullah ibn Hussein was proclaimed king on May 25.

Mandated Territories

Territory	Area (Sq. Mi.)	Date of Mandate	Mandatory Power	Former Title	Former Administration
SOUTH-WEST AFRICA, including Caprivi Zipfel, formerly part of Bechuanaland protectorate	323,060	Dec. 17, 1920	Union of South Africa	German South-West Africa	German empire
TOGO, comprising:					
(1) Togoland; i.e., western section, excluding the seaboard	13,040	July 20, 1922	Great Britain	Togo	German empire
(2) Togo; i.e., eastern section and seaboard	20,000		France		
CAMEROONS, comprising:					
(1) Cameroons adjoining Nigeria	34,081	July 20, 1922	Great Britain	Kamerun	German empire
(2) Cameroun adjoining French Equatorial Africa	166,200		France		
TANGANYIKA	360,000	July 20, 1922	Great Britain	German East Africa	German empire
RUANDA-URUNDI	21,200		Belgium		
PALESTINE	10,100	Sept. 29, 1923	Great Britain	Palestine	Turkish empire
NEW GUINEA, TERRITORY OF, comprising:					
(1) Northeastern New Guinea (i.e., the northern section of southeast New Guinea)	93,000	Dec. 17, 1920	Commonwealth of Australia	Kaiser Wilhelm's land	German empire
(2) Bismarck Archipelago (New Britain, New Ireland, the Admiralty Isles, etc.)				Bismarck Archipelago	
(3) Certain of the Solomon Islands (Bougainville, Buka, etc.)				German Solomon Islands	
WESTERN SAMOA, comprising Savaii, Upolu, etc.	1,153	Dec. 17, 1920	New Zealand	German Samoan Islands	German empire
NAURU	8	Dec. 17, 1920	British empire—Great Britain, New Zealand and Australia the present administrator	Nauru	German empire
PACIFIC ISLANDS NORTH OF THE EQUATOR, comprising:					
(1) Marianas or Ladrone Islands (except Guam)	811	Dec. 17, 1920	Japan (under U.S. administration)	No change	German empire
(2) Caroline Islands, comprising the Eastern Carolines and Western Carolines, together with Yap Island and Palau					
(3) Marshall Islands					

Appropriate agreements for transfer had been reached or the policy of the administering power outlined by October, on the eve of the second half of the first general assembly in New York. The future of the Pacific mandates which were allotted to Japan was bound up with the whole far east settlement, which was a matter for the peace conference taking place in 1947. During the second half of the general assembly United Nations trusteeship was fully discussed by its fourth committee. The claims of the Union of South Africa for the annexation of South-West Africa were strongly opposed, and Great Britain was criticized for failing to submit a draft agreement for Palestine. Finally, the assembly recommended that the Union of South Africa should transfer South-West Africa to the trusteeship system. The five trusteeship agreements were adopted which enabled the Trusteeship council to be set up, consisting, according to the charter, of these five trusteeship states and three permanent members of the Security council, together with Mexico and Iraq (at one time itself under a mandate) elected by the assembly. (See also NEW GUINEA.) (M. Fe.)

Manganese. Wartime gaps in the world production table were largely filled during 1946, but there were still insufficient data to permit an estimate of the world total in 1943, 1944 or 1945. However, it is to be noted that reported outputs in 1945 were on the whole very close to the total from the same countries in 1943.

Table I.—World Production of Manganese Ore, 1939–45

	(In thousands of short tons)						
	1939	1940	1941	1942	1943	1944	1945

United States	32.8	44.9	87.8	190.7	205.2	247.6	182.3
Total	5,704	6,103	5,800	5,300	?	?	?

United States.—Manganese production during World War II was a repetition of the experience of World War I. Output was materially increased above the peacetime level, but reached only a small fraction of the demand, as shown in Table II.

Table II.—Data of Manganese Industry in the U.S., 1940–45

	(In thousands of short tons)						
	1939	1940	1941	1942	1943	1944	1945

U.S.S.R.	151.5	349.2	32.7	17.8	4.6	?	151.3
Consumption	?	?	1,310.5	1,481.7	1,588.3	1,593.1	1,485.9

In the first three quarters of 1946 shipments totalled 107,700 tons, imports 1,187,835 tons and consumption 810,161 tons. Shipments and consumption were both well below the 1945 rate, but imports increased slightly. Consumers' and producers' stocks increased from 513,063 tons at Dec. 31, 1945, to 700,048 tons at Sept. 30, 1946, while Metals Reserve company stocks declined from 1,119,158 tons to 1,086,136 tons, totals of 1,632,221 tons and 1,786,184 tons respectively, or a net surplus of 475,374 tons of production plus imports, as compared with consumption during the period. (G. A. Ro.)

Manitoba. Central province of Canada and geographic centre of North America; established July 15, 1870; area 246,512 sq.mi. (26,789 sq.mi. water); pop. (1946 census) 718,699. Capital, Winnipeg, incorporated in 1873 (224,091). Other cities are, St. Boniface (21,320), centre of western culture for Canadians of French origin, Brandon (17,147), Portage la Prairie (7,545), and Flin Flon (municipal district) (7,522),

mining and smelting centre of the north.

History.—The 21st legislative assembly was led in 1946 by a coalition executive council under the premiership of Stewart Sinclair Garson. The government party comprises members of the Liberal-Progressive, Progressive-Conservative and Social Credit groups. During the life of the assembly the three armed services were to be represented by their elected representatives. In February the executive council was increased by two additional cabinet ministers, C. Rhodes Smith to the portfolio of labour and C. E. Greenlay to that of provincial secretary.

Education.—Enrolment in public schools in 1945 totalled 117,790. Correspondence students numbered 2,204, teachers 4,353, with the public schools of the province expending \$10,775,667 for the period. University enrolment increased to a historic peak of 6,919, in part represented by attendance of veterans under rehabilitation educational grants. A larger school unit was established by vote in the Dauphin area and this experimental administrative organization was operating for the school year 1946–47. St. Andrews college, the first Ukrainian college in Canada, established classes in the fall of 1946. A new residential normal school for teacher training was created in Tuxedo with an enrolment of 450.

Health and Welfare.—The health plan inaugurated in 1945 resulted in the creation of 12 health units, 2 medical nursing units approved and 3 hospital districts approved by the rate-payers concerned. Those at Altona and Carman hospitals were in operation. The commission of the international health division and the medical sciences division of the Rockefeller foundation at the request of the government and university reported upon personnel and training required to meet the needs of the Manitoba Health Services act. The Kellogg foundation granted \$40,000 to assist in training of personnel under the plan. Pre-marital blood tests by law were made effective from Oct. 1.

Communication.—Manitoba is served by main and branch lines of the Canadian National and Canadian Pacific railways. Hudson's Bay railway from The Pas to Churchill provides transportation to Manitoba's ocean port. Stevenson's airport is the centre for Trans-Canada Air Lines and aviation centre for the region. All-weather provincial highways totalled 8,826 mi. in 1946. The government-owned telephone system, with 101,975 subscriber stations (including Winnipeg with 71,384) operated two radio stations—Winnipeg and Brandon. Four privately-owned stations were in operation—two in Winnipeg, one in St. Boniface (a French-speaking station) and one serving the northern areas at Flin Flon. St. Boniface and one Winnipeg station were additions of 1946.

Finance.—Government revenue for the fiscal year ending April 30, 1945, totalled \$22,268,320 with expenditures of \$19,054,253; liquor profits from the government liquor commission represented income profit of \$4,380,110. Debt was reduced during the year by \$5,822,077. In 1945 the 169 units of local government, other than the four cities, collected \$10,674,500.

Agriculture.—The gross agricultural production for 1946 (estimated) totalled \$249,443,000, an increase and record, created by both increased volume and prices. Wheat production increased from \$48,600,000 for 45,000,000 bu. in 1945 to \$74,970,000 for 63,000,000 bu. for 1946. Sugar beet acreage and production in the Red river valley continued satisfactory with 11,600 ac. seeded and 82,000 tons produced in 1946.

Manufacturing, Minerals, Fisheries, Furs.—Manufactures for 1946 were estimated at \$320,000,000 (gross); minerals (1946 est.) \$17,300,000; fisheries (1946 est.) 34,244,100 lb. with value to fishermen of \$4,034,248 and market value \$5,343,570; furs (1945–1946), wild catch \$5,145,706, farms \$1,280,010, processed in Winnipeg \$2,566,325, exported from Manitoba (including other provinces) \$11,262,707. (J. L. J.)

Manufacturers, National Association of: see SOCIETIES AND ASSOCIATIONS.

Manuilsky, Dmitry Zacharovich (1883–), Ukrainian statesman, studied at Petrograd university. Upon the outbreak of the revolution in 1917 he joined the Bolsheviks, was made a member of the Central committee of the Communist party and in 1924 was appointed to the Comintern (third international). Manuilsky fought in World War II and was decorated with the Order of Lenin in 1943. He was appointed foreign commissar for the Ukraine Soviet republic in 1944 and represented that state at the United Nations conference in San Francisco the following year. In 1946 he was appointed chairman of the Ukrainian delegation to the U.N. general assembly.

At the London sessions of the U.N. Security council (Jan.–Feb. 1946) he supported Andrei Vishinsky in the latter's demands for an investigation of the Indonesian situation and implied that the Dutch and British opposed the probe because of their oil interests in Indonesia.

Manuilsky, who attended the 21-nations peace conference in Paris, announced Aug. 25, 1946, that he would file charges before the Security council that Greece was endangering the peace in the Balkans. After heated discussion in the Security council at Lake Success, N.Y., as to whether he should be heard, the council finally permitted him to present his case.

Mao Tse-Tung (1893–), Chinese Communist leader, was born in the village of Shao Shan, Hunan province. He joined Sun Yat-sen's revolutionary army in 1911, entered the Hunan Normal school (receiving his degree in 1918) and attended lectures at the Peiping university. Mao joined the Communist party in 1920 and two years later was secretary of the party's branch in Hunan province. He became political commissar for the Chinese Red 4th army in 1928 and was elected chairman of the first All-China congress of soviets in Dec. 1931.

Mao's influence grew with the successes of the Chinese Communist forces against Chiang Kai-shek's armies in the early 1930s. Later Chiang tried to break up Communist control of a large part of northwest China, but his demands in 1943 for dissolution of the Chinese Communist armies and political organizations were rejected by Mao.

After the surrender of Japan in the late summer of 1945 Mao and Chiang began personal negotiations; they failed to agree on military and administrative unity, however, and civil war between the two factions broke out. Mao charged (June 24, 1946) that U.S. aid to Chiang's government was the "fundamental cause of the outbreak and propagation of the civil war." He demanded that the U.S. immediately halt lend-lease to Chiang and withdraw all its forces from China.

Maple Products. The 1946 maple season in the U.S. was better than the year 1945 but still below any other year on record. Syrup production was estimated by

Maple Trees Tapped, Sugar and Syrup Production by States, 1946 and 1945
(In Thousands)

State	Trees tapped		Sugar made (lb.)		Syrup Made (gal.)	
	1946	1945	1946	1945	1946	1945
Vermont	3,298	3,111	256	147	607	351
New York	2,686	2,202	67	22	411	280
Ohio	532	560	0	1	80	136
Michigan	502	474	2	3	63	82
Pennsylvania	291	285	11	18	45	53
Wisconsin	210	226	0	1	28	23
New Hampshire	207	199	12	9	36	25
Massachusetts	154	157	12	20	38	22
Maine	87	92	7	6	10	9
Maryland	33	30	5	10	10	10

the U.S. department of agriculture at 1,354,000 gal. compared with 991,000 gal. in 1945 and an average of 2,625,000 gal. for 1935–44. Sugar production was 337,000 lb. or 42% more than the 251,000 lb. of 1945 but 48% less than the average of 643,000 lb., 1935–44. The poor output was caused by the warm weather in February and March that made a short sap season. In Ohio the season was only 13 days. The quality of the crop was poor. The number of trees tapped was 8,004,000 compared with 7,336,000 in 1945 and an average of 10,442,000 in 1935–44.

(J. C. Ms.)

Marble: see STONE.

Margarine (OLEOMARGARINE). The production of margarine in the U.S. declined in 1946 to about 515,000,000 lb. compared with 591,000,000 lb. in 1945 and a prewar average of 303,000,000 lb., 1935–39. Manufacturers' quotas of fats and oils for use in margarine were less in the first half of the year. The average per capita civilian consumption was estimated at about 3.5 lb. in 1946 compared with 4 lb. in 1945. During World War II when lard was scarce consumption of margarine increased steadily from the prewar average of less than 3 lb. per capita. The military and relief needs declined in 1946. U.S. armed forces used only small amounts but exports were considerable to Great Britain for use by the armed forces. The termination of price ceilings in October was followed by immediate price advances from 19 cents to 25.5 cents per pound wholesale. The supply of vegetable oils began to increase about midyear, particularly coconut oil. The use of the latter in margarine was prohibited during World War II to conserve glycerine for military uses.

The federal tax was not considered a retarding factor in the use of margarine in competition with butter. While butter was scarce margarine consumption increased slowly. Improvements in the manufacture of cooking fats of several types were expected to offer greater competition to margarine than butter alone. Changes in cooking practices, notably the use of the pressure cooker, were expected to have an effect on the use of margarine.

(J. C. Ms.)

Marianas Islands: see MANDATES.

Marine Biology. Details of several wartime technical researches and discoveries were released through appropriate channels during 1946. From the newly established hydrographic office of the U.S. navy a new "Drowned Archipelago" was described between Hawaii and the Marianas.¹ From tens of thousands of echo-soundings by cruising navy vessels, a subsea area in the western Pacific was mapped. There were charted approximately 160 submerged flat-topped peaks subtended from an extensive ocean-floor plateau. Because of the peculiar configuration of these, in contradistinction to the physical configuration of the present surface atolls of the region, the concept was advanced that these mountains—once volcanic—emerged from an ancient sea and were eroded for an indefinite period of time. Subsequently—perhaps 500,000,000 years ago—the area was submerged by the simultaneous sinking of the floor and the upwelling of the sea water.

The director of scientific research of the British admiralty² released the results of the application of new techniques used in forecasting the force and direction of ocean waves and swells generated in storm areas. An analyzer of new design, involving the recording of both pressure fluctuations below the surface and an inverted echo-sounder for surface waves, made it possible to detect and compute the velocity of the low-long swells dis-

¹ *Science News Letter*, June 8, 1946.

² See *Nature*, Feb. 9, 1946, vol. 157, no. 3980.

patched from any given storm area.

At Lowestoft (Suffolk, England), the Fisheries laboratory³ was reopened in Sept. 1945 after being closed during the war. Extensive plans were drawn for fisheries work in the waters about the British Isles and in the Arctic.

According to the people's commissar of the fishing industry in the U.S.S.R.,⁴ the Japanese management of the fishing industry of southern Sakhalin and the Kuril Islands was to be replaced and expanded so that the fish yield from these and adjacent areas of Kamchatka might be greatly increased. The industry would not only be rehabilitated but substantially reconstructed; the building of ten new canning and cold storage plants was started in the northern Kurils and southern Sakhalin regions. In a postwar emergency, since fish constitutes the most important single animal food for the Japanese, the fisheries division, through the national resources section⁵ under Allied Powers, initiated a program for providing the Japanese fisheries fleet with fuel oil and equipment and rigidly prescribed an area about the islands where fishing might be permitted. A limited area was also stipulated about the Bonin Islands for whaling, but no landings were to be permitted there.

The Swedish Marine Biological commission⁶ started a three-months' survey of the bottom-muds of the Mediterranean sea. The state-owned research ship "Skagerack" was used as a floating laboratory. The operations were carried on in the vicinity of Algiers and Malta. Data gathered was expected to throw light upon climatic and volcanic catastrophes of past ages, as well as reveal the story of the supposed ancient transatlantic plateaus over which animals and plants might have migrated.

Another Swedish oceanographic expedition using the 1,100-ton training ship "Albatross," was commissioned for a deep-sea exploration lasting 15 months and circumnavigating the globe. The expedition contemplated studies within the equatorial counter-current of the seas, with special attention to areas about the Puerto Rico deep (9,000 m.) and the Philippine deep (10,500 m.). Experiments at the Krusadai Biological station (South India)⁷ indicated curious adaptive and growth features expressed by the native salt-water milkfish *Chanos chanos*. After a brief adaptive period, fishes placed in fresh water showed a remarkable acceleration in growth, some as much as two feet in length in a single year. Its high market value as a food fish and its capacity to grow rapidly prompted the suggestion that it might be suited to profitable culture in the fresh-water ponds of India.

While the mechanisms of sex-reversal in the vertebrates are generally understood to repose in the relative interbalance between estrogens and androgens, what the factors are that induce certain commercially important prawns (shrimp) to undergo such reversals in their individual life histories have not yet been elucidated. Reviewing their observations concerning the life history of *Pandalus borealis*, a North Atlantic prawn, two Norwegian investigators⁸ brought to light some remarkable discoveries.

Prawns that lived to the age of one and one-half years were either males, which spawn for the first time at that age, or they were transitional nonsexed individuals which later transform into females. However, after the males reached the age of two years and had spawned twice, they gradually passed through a transitional stage and finally underwent complete sex-reversal and became mature females. These produced eggs for the first time at the age of three and one-half years. This curious fact

perhaps explains in part the fact that in commercial catches the males outnumber the females in the ratio of about ten to one.

Quite a different interest attaches to a report of the discovery that the *Penaeid* prawns⁹—a commercial warm-water marine form—contrary to all other decapods, do not carry their fertilized eggs attached to the abdomen, but shed them immediately into the sea waters. The pelagic eggs then hatch into nauplii and thus become widely distributed throughout the sea.

An experiment, on a small scale, applying fertilizers to an open sea loch was reported from the University of Edinburgh in Scotland.¹⁰ Additions of calculated amounts of sodium nitrate and phosphate in the waters in Loch Craiglin, a small arm of Loch Sween, induced extremely heavy settlement of the common mussel as well as an acceleration in fish growth.

Details of the development of the silver zeolite briquettes, used by aviators and sailors to provide drinking water from sea water during the war, were released by two research investigators.¹¹ This discovery was among the most useful to come out of the exigencies of the war.

Waters of the Antarctic¹² continued to engage the minds of the scientists and the layman. Using the 20,000-ton whale factory ship, "The Empire Victory," accompanied by smaller and faster whale catchers, British seamen returned to England from the prawn-teeming, plankton-cluttered Antarctic waters—the feeding grounds of the finback whale—with a loot of 40,000 tons of whale oil, in addition to quantities of compressed flesh and chopped bones salvaged from the bodies of 1,600 finbacks. Early December witnessed the start of a four-months' Antarctic expedition of the U.S. navy,¹³ under the direction of Rear Adm. Richard E. Byrd. It was stated that much of the scientific data gathered on a former trip was to be reviewed and new observations concerning the Antarctic region ascertained. (See also OCEANOGRAPHY; ZOOLOGY.)

Marine Corps. Established Nov. 10, 1775, by resolution of the first continental congress, the marine corps is an integral part of the naval establishment, comprising normally 20% of its total strength. Enlistments are entirely voluntary and officers are procured from graduates of the naval academy at Annapolis, Md., the naval reserve officer training corps and selected enlisted men.

The commandant of the marine corps in 1946 was Gen. Alexander Archer Vandegrift, who with administrative and operational staff was stationed at headquarters in the navy department, Washington, D.C.

Units of the marine corps organized reserve are maintained in major cities, and in 1946 totalled 17 ground units and 25 air units. Headquarters for the air reserve are at Glenview, Ill. Authorized strength of the organized reserve was placed at 33,262.

During 1946 four of the wartime divisions were deactivated as the corps was reduced to its authorized peacetime strength of

CHINESE CHILDREN accepting candy from a U.S. marine who was stationed in Tientsin during 1946

100,000 and 8,200 officers and warrant officers. All personnel inducted under selective service and all reserves were discharged or assigned inactive duty by Dec. 1946. Demobilization of the women's reserve was completed by Sept. 1, except for 300 women retained for 10 months at headquarters.

The 2d division remained in occupation of Kyushu until June and had returned to its base at Camp Lejeune, N.C., by Aug. 1946.

Marine forces in north China were reduced during the year, all units of the 3rd corps being relieved and disbanded except the 1st division, reinforced.

Units of this division were stationed at Tientsin, Peiping, Tsingtao and Chinwangtao and small liaison teams attempted to prevent the spread of hostilities between Chinese nationalist and communist forces.

The 1st provisional brigade was formed in January, took part in Caribbean manoeuvres with the fleet and was absorbed by the returning 2nd division in August. In the same month the 3rd brigade was activated for duty with the Pacific fleet marine force.

Marine troop-training units were formed with the Atlantic and Pacific fleets, consisting of specialized instruction staffs for the training of army, navy and marine units in landing operations.

In November enlisted ratings were standardized to include only the following: private, private first class, corporal, sergeant, staff sergeant, technical sergeant and master sergeant. Officer ranks remained the same.

Marriage and Divorce.

Throughout the civilized world the year of 1946 was characterized by organized efforts to conserve family life. Under the auspices of the Swedish National Association for Sexual Education an international conference on problems of sex education, family planning and marriage counselling was convened in Stockholm. Delegates from seven countries attended. Denmark reported a dearth of family and marriage counselling agencies although considerable research was taking place on human fertility. In England about 57 clinics of the Family Planning association were operating as were several mothers' clinics. The Marriage Guidance council, under the direction of Dr. David Mace, was offering a greatly expanded family guidance service. From Finland came a report that little sex or marriage education was being given. Delegates from the Netherlands indicated that World War II had halted all work in marriage and family guidance, but that a National Association for Sexual Reform had been formed with its objectives including sex education and the establishment of centres on family planning, sexual problems and marital difficulties. Although the inroads of war into Norway had closed all clinics of the National Association for Maternal Hygiene, new clinics were functioning in several cities. These clinics had made provision for prenatal and infant care. In Sweden the National Association for Sexual Education, which had expanded its activities, was maintaining clinics in Göteborg, Malmö and Stockholm. The association was publishing its own books and pamphlets and conducting a comprehensive program in sex education and family relations. Delegates from the United States reported that several national organizations were supporting the establishment of family problem consultation centres and marriage counselling services. The international conference expressed a desire to find ways of assisting countries whose work

in sex and family education had been discontinued by war. A committee was appointed to study the possibilities of organizing an international association of the various groups and agencies interested in the fields of sex education, planned parenthood and marriage counselling.

In Canada the government announced that grounds for divorce, permitted only for adultery, would not be extended. The Canadian Youth commission reported a survey that showed English-speaking Canadians approved, French-speaking Canadians disapproved, of greater freedom of social contacts between young men and women. The men's physical education section of the Ontario Educational association asked the Royal Commission on Education to put courses in sex education in the secondary schools. By the proclamation of the governor a divorce court was established in Prince Edward Island.

England was beset by many postwar problems. It was reported that the rise to 25,000 divorce cases in 1945 and an arrearage of 43,000 divorces sought by persons in the armed forces had so clogged the machinery of the courts that participants were facing a delay of 3-4 yr. in securing divorces. Concern was expressed in many quarters that such delays would lead to many irregular unions with the probability that illegitimate children and other grave social problems would follow. In the house of commons it was declared that 40% of girls marrying under the age of 20 yr. were pregnant on their wedding day and that one-quarter of all first babies born to married couples were conceived outside of marriage. The attorney general suggested that one way to attack the problem was to provide young people with social education in the responsibilities and duties of citizenship and marriage. He also proposed that better houses, freedom from anxiety of unemployment and better recreational facilities would conduce to happier family life. The general assembly of the Presbyterian Church of England, issuing its first ruling on divorce in nearly three centuries, instructed its ministers to officiate at weddings of divorced persons only when satisfied that such persons were morally innocent in the divorce, had expressed penitence and been admitted, or readmitted, to the Christian church. In a resolution the assembly expressed belief that divorce was contrary to biblical teaching. The need for marriage counselling centres was widespread and through the influence of the Marriage Guidance council more than 100 counselling services were operating. Marriage counselling facilities for Roman Catholics were being set up.

The divorce rate in Germany was estimated as ten times greater than the rate before World War II. In Poland new legislation was passed requiring a premarital physical examination and providing that no divorce could be granted until the presiding judge had tried to effect a reconciliation. Under auspices of the Christian council, "home-life weeks" for the strengthening of family life were held in the principal cities of South Africa.

South America was also taking steps to stabilize family life. In Argentina a broad program of parent education was getting under way with the establishment of associations resembling the parent-teacher associations of the United States; a premarital physical examination was also being required. The Assistance league established a school for brides in São Paulo, Brazil, to offer courses in personal and social hygiene, nutrition and child care. In Paraguay the law required a premarital physical examination of both sexes. The Consultorio de Educacion Familiar Popular Gratuito of Peru was offering courses in home economics which also dealt with problems of marital adjustment.

The United States, shaken by a rate of one divorce for every three marriages in 1945, resigned itself to the similar ratio in 1946. In Los Angeles the number of divorce actions filed during the first half of the year exceeded the number of marriage li-

cences issued. Comparing duration of marriages in Los Angeles county before divorce for the years 1933 and 1945, the American Institute of Family Relations found that the average duration in 1933 was 9.3 yr., with only 6.1 yr. in 1945. The trend toward increasing divorce rates was evident throughout the land with some urban areas reporting nearly as many divorces as marriages. Some authorities predicted that another decade might see one divorce for every two marriages. In spite of an unrelieved and acute housing shortage, so severe it was estimated that one-third of all newlyweds had to begin their marriages in the homes of relatives, more than 1,500,000 marriages took place in 1946. Cost of living advanced during the year with a sharp increase noted when price controls were removed. Labour unrest, with its strain on family budgets, continued to be present.

Many soldiers returning home brought foreign brides with them. Wives went overseas to join husbands who were in armies of occupation. Reconversion, proceeding at a rapid pace and attended by shifts of workers to other areas, aggravated the housing shortage. Unequal sex ratios, especially apparent in cities, made it difficult for many women to find husbands. More than 1,000,000 veterans were receiving educational and vocational training. Colleges, faced with overwhelming enrolments, gave veterans first preference. Since many veterans had married, college grounds were dotted with trailer camps and other improvised housing.

It was apparent that concerted action was necessary if family stability was to be achieved. Plans went forward for a national conference on family life which would analyze the problems of marriage and the family. Church federations in many cities began to organize centres for marital counselling. The Committee on Marriage, the Family and the Home, of the Central Conference of American Rabbis urged rabbis to require a waiting period of five days between the application for a marriage licence and the performance of the ceremony, to require the couple to obtain and exchange medical health reports, not to marry individuals who were imbecilic, insane or afflicted with communicable tuberculosis or infectious venereal disease and to insist that couples have premarital conferences with the rabbis and have studied some standard manual on marriage. More colleges than ever before were offering courses in marriage and the family and about one-third of the more important institutions claimed to give practical preparation for marriage; but less than 10% of the students were enrolled in such courses. Public-opinion polls showed that a great majority of persons polled favoured the teaching of courses in sex education and marriage in secondary schools. Outstanding educational experts said that U.S. schools were failing worse in fitting their pupils for personal and family responsibilities than in any other way. Many high school systems were offering courses, in some cases experimentally, in sex education and marriage with a few schools in Minnesota giving education in family living beginning with pupils of kindergarten age and carrying through the senior high school. Several states, notably Utah, were holding family-life institutes and vigorously campaigning for adult education to promote more successful marriage and family stability.

Among the national and regional conferences dealing with family life held during the year were the National and Pennsylvania Conferences on Family Relations, the Annual Conference on the Conservation of Marriage and the Family at the University of North Carolina, the Marriage and Family Life Council of Miami and South Florida and the Annual Institute on Marriage and Home Adjustment of The Pennsylvania State college. (See also CENSUS DATA, 1946.) (C. R. A.)

Europe.—France took steps to reduce infant mortality by the *Ordonnance* No. 45-2720 of Nov. 2, 1945. Its preamble explained that to arrest and reverse the alarming rise of infant

mortality between 1938 and 1945 the health of pregnant women must be protected by immediate and rigorous measures. One of these, amending article 63, *code civil*, was the introduction of the health certificate, to be produced to the registrar before marriage. The certificate would show that a medical practitioner had examined the man and woman within two months before marriage. Any warning of contagious or chronic diseases, dangerous to the marriage partner or descendants, was to remain the secret of doctor and patient. A registrar marrying a man and woman without a certificate was liable to a fine up to 100 francs (84 cents).

In Germany and elsewhere in formerly German-occupied territory the demise of the national socialist regime ended racial discrimination in marriage law. For Germany proper Control Council law No. 16, dated March 1, 1946, repealed the German law of July 6, 1938, and restored on the whole the marriage sections of the 1900 German civil code. Aggrieved spouses, their children or the public prosecutor might bring a hardship action within two years of the passing of the Control Council law; the court had power to remove economic or personal hardship inflicted under the 1938 statute or by a judgment that was wholly or predominantly based on racial, political or religious discrimination. Annulled or divorced marriages could not be restored.

Changes of political regimes in eastern Europe produced something like a revolution of the marriage law in that region. The Hungarian decree of Aug. 2, 1945, extended divorce in two respects. After two years of married life both spouses might jointly apply to the court for divorce. If consent were withheld, even the party guilty of desertion might make the application, provided that husband and wife had not lived together for five years. The law also provided for divorce under this head, if an earlier divorce petition on another ground had been dismissed. Neither party could be declared guilty in the judgment. Poland, Yugoslavia and Bulgaria made civil marriage compulsory and retained the church wedding as an optional ceremony (Polish decree of Nov. 7, 1945; Yugoslav law of April 9, 1946, which also perpetuated local customs; Bulgarian law of May 12, 1945). Husband and wife were given equal status. The wife might choose her family name and her profession or trade and was to contribute to the household and education of children. Property of spouses remained separate. Nullity and divorce followed lines generally accepted elsewhere, but with important additional grounds in Poland and Yugoslavia, such as dishonourable behaviour and infamous occupation. Poland also provided for divorce in case of venereal disease and sexual impotence arising after marriage and the maligning of one spouse by the other. In Yugoslavia divorce could be obtained by consent, and in its absence on petition proving temperamental incompatibility, lasting disagreement or irremovable hostility. Poland did not go so far as this, but an introductory law provided for two temporary grounds of divorce to make a clean sweep after World War II and its consequences. Quisling activity during the German occupation was a ground for divorce, and for three years divorce by consent was to be pronounced by courts, provided that the marriage had lasted three years.

(O. C. G.)

Marshall, George Catlett (1880—), U.S. army chief of staff, was born at Uniontown, Pa., on Dec. 31. Commissioned second lieutenant of infantry Feb. 2, 1901, after completing his studies at Virginia Military institute, Lexington, Va., and the Army Staff college, he advanced through the grades to brigadier general in 1936. He was with the U.S. expeditionary forces in France in 1917. He was stationed in China, 1924–27. Gen. Marshall was made chief of staff on Sept. 1, 1939, the day Hitler invaded Poland; he was also appointed to the rank of full general. Tactful and

sagacious, he displayed a rare talent for harmonizing diverse points of view and for retaining everyone's good will. He directed and co-ordinated the enormous task of building up the U.S. army after enactment of the Selective Service bill. When war came, Dec. 7, 1941, his army consisted of only 1,500,000 men. By the close of the war in Europe in May 1945, it had grown to 8,300,000, of which more than 4,000,000 were overseas. Marshall was promoted, Dec. 15, 1944, to the new five-star rank of general of the army.

In the army report on Pearl Harbor, made public Aug. 29, 1945, he was charged with "failure in his relations with the Hawaiian department." However, both President Truman and Secretary of War Henry Stimson took issue with this charge, and Stimson asserted that Marshall had acted with his "usual great skill, energy and efficiency." In his biennial report, issued Oct. 9, Marshall maintained that the only adequate defense a nation can have is to maintain the "power of attack" and urged establishment of a strong citizen army "to greatly strengthen the hand of the U.S. in securing a genuine organization to handle international differences." He also advocated a merger of the armed services (Oct. 18). Marshall relinquished his post as chief of staff to Gen. Dwight D. Eisenhower, Nov. 20. A week later (Nov. 27), he was named ambassador to China, replacing Maj. Gen. Patrick Hurley.

After 13 months of ceaseless negotiations with both warring factions in China, Marshall returned to Washington. In a "personal statement" issued Jan. 7, 1947, he flayed "extremist elements" in both Chiang Kai-shek's government and in the Chinese Communist party for frustrating "time and again" his efforts to end the civil war in China. A few hours after this statement was delivered, President Truman announced Marshall's appointment as secretary of state, succeeding James Byrnes, who resigned for reasons of health.

Marx, Wilhelm (1863–1946), German statesman, was born on Jan. 15 in Cologne. He studied jurisprudence at the University of Bonn and subsequently became a county judge and senate president of the Berlin court chamber. A former chancellor of Germany (1923–24, 1926–28) and Centre party leader, he was indicted for fraud by the Nazi regime, but the charges were dropped and Marx was allowed to slip into obscurity. In 1945 he was discovered by the U.S. occupation forces, living in Neustadt. He was, he said: "bewildered by events." He died at Bonn, Germany, on Aug. 5. (See *Encyclopædia Britannica*.)

Maryland. Maryland, long known as the "Old Line state," also as the "Free state," lies on the Atlantic seaboard between Pennsylvania on the north and Virginia on the south. The total area is 10,577 sq.mi., of which 690 are water. Population (1940) 1,821,244; urban, 1,080,351; rural 740,893; white, 1,518,481 (foreign born, 81,715); nonwhite, 302,763. On July 1, 1945, the bureau of the census estimated the civilian population of the state at 2,125,419. Capital, Annapolis (pop. 1940, 13,069); other cities: Baltimore (859,100), Cumberland (39,483), Hagerstown (32,491), Frederick (15,802) and Salisbury (13,313).

History.—William Preston Lane, Jr., Democrat, was elected governor in 1946 for a four-year term, to begin on Jan. 8, 1947. The general assembly meets regularly in odd-numbered years. Herbert R. O'Connor, Democrat, former governor, was elected to the United States senate in 1946, succeeding George L. Radcliffe, Democrat. The term of his colleague, Millard E. Tydings,

Democrat, was to expire in 1950.

Communication.—

During the fiscal year ended June 30, 1946, the state roads commission expended \$14,280,634. The total mileage of roads in the state highway system was 4,496.38; in the county systems, 11,141.54; total, 15,637.92. At the close of the year the total mileage of line-haul steam railroads was 1,362; of switching and terminal companies, 115; of electric railways (interurban), 65.24. The state aviation commission reported 34 commercial airports licensed on Nov. 30, 1946; 8 military airports; 1,339 registered pilots; 730 recorded personal planes. As of Nov. 30, 1946, there were 274,003 telephone subscribers; total number of instruments, 467,885.

Education.—In 1945-46 there were in the state (including Baltimore whose schools are separately administered) 915 public elementary and occupational schools, with a total enrolment of 201,872 and a teaching staff of 5,223 (excluding 610 pupils taught by 21 teachers on the staffs of the elementary schools at the four state teachers' colleges). There were 217 secondary and vocational schools, with an enrolment of 94,984 and a teaching staff of 3,852. In the elementary schools about one pupil in five was a Negro; in the higher schools about 2 students in 13 were Negroes.

The Catholic school enrolment for the entire state was 47,792 white and 2,134 Negro with a total of 49,926. The enrolment in non-Catholic private schools was 7,530 white and 76 Negro, with the total 7,606. The state superintendent of schools in 1946 was Dr. Thomas G. Pullen, Jr., whose four-year term of office was to expire in 1948.

Social Insurance and Assistance, Public Welfare and Related Programs.—During June 1946, old-age assistance was extended to 11,546 persons (cost, fiscal year ended June 30, 1946, \$3,898,134); 454 needy blind persons were assisted (cost fiscal year, \$161,943); 3,822 families received assistance for the care of dependent children (cost fiscal year, \$1,489,060). Unemployment compensation benefits paid during the fiscal year 1945-46 amounted to \$25,146,443.

Correctional institutions and the number of inmates on Oct. 16, 1946, were as follows: Maryland penitentiary, 1,193; Maryland house of correction, 1,310; Maryland reformatory for males, 615; Maryland reformatory for women, 183 (77 white, 106 Negro). Four institutions were maintained for juvenile delinquents, white and Negro; total number of inmates, 647.

Banking and Finance.—As of June 30, 1946, the state bank commissioner reported 106 state banks and trust companies with total deposits of \$889,839,653 and total resources of \$956,086,932 and ten mutual savings institutions with deposits of \$372,429,219 and resources of \$414,704,832. On the same date there were 64 national banks in the state with deposits of \$739,429,000 and resources of \$788,966,000. The resources of all banking institutions, state and national, in Maryland on June 30, 1946, totalled \$2,159,757,764. State appropriations for the year ended June 30, 1946, were \$65,717,404; expenditures, \$64,313,002; gross debt, \$20,902,000; net debt, \$18,712,644; general fund surplus, \$11,932,469.

Agriculture.—The farm value of the principal crops for the crop year 1946 was \$114,938,000 compared with \$88,620,000 for 1945. During the first 8 months of 1946, livestock and livestock products brought a total of \$66,906,000, as compared with \$70,589,000 during the like period of 1945.

Table I.—Leading Agricultural Products of Maryland, 1946 and 1945

	1946	1945
Barley, bu.	2,174,000	1,885,000
Corn, bu.	17,328,000	17,057,000
Oats, bu.	1,254,000	1,110,000
Wheat, bu.	7,320,000	6,771,000
Hay, tons	631,000	630,000
Tobacco, lb.	40,500,000	18,375,000
Potatoes, bu.	2,244,000	1,915,000
Tomatoes, market, bu.	975,000	832,000
Tomatoes, processing, tons	139,200	119,100

Manufacturing.—As of Sept. 15, 1946, the Maryland commissioner of labour and statistics estimated the number of manufacturing establishments at 3,700 employing 246,935 persons—average weekly payroll, \$11,425,000, average weekly wage, \$46.27, average hourly wage, \$1.12, and average

hours worked per week 41.4. Nonmanufacturing employment was 298,943 with average payroll of \$10,875,000. Combined employment was 545,878 with aggregate payroll of \$22,300,000.

Mineral Production.—The latest figures available in 1946 on mineral production are shown in Table II.

Table II.—Leading Mineral Products of Maryland, 1945 and 1944

	1945	1944
Bituminous coal (net tons)	1,779,231	1,875,804
Fire clay (net tons)	58,034	81,605

Oysters.—The commercial catch of oysters in Maryland waters during the season 1945-46 totalled 2,399,111 bu. compared with 2,436,113 bu. during the 1944-45 season. (J. S. A.)

Massachusetts. A north Atlantic state of the U.S.A., admitted to the union on Feb. 6, 1788. Popularly known as the "Bay state." Area, 8,257 sq.mi., including 350 sq.mi. of water; population (census 1940) 4,316,721; (1946 est.) 4,567,621, of which approximately 88% was urban, 12% rural. The capital is Boston (pop. 770,816). Other cities of 100,000 or more inhabitants are Worcester 198,741; Springfield 159,896; Fall River 115,062; Cambridge 111,124; New Bedford 110,341; Somerville 102,177; Lowell, 101,229; and Lynn 105,153.

History.—In 1946 Gov. Maurice J. Tobin (Dem.) completed the term for which he had been elected in Nov. 1944. Other constitutional officers serving in 1946 were: lieutenant governor, Robert F. Bradford (Rep.); secretary of state, Frederick W. Cook (Rep.); treasurer, John E. Hurley (Dem.); attorney-general, Clarence Barnes (Rep.); auditor, Thomas J. Buckley (Dem.).

During the legislative session several notable measures were adopted, including the establishment of a Fair Employment Practice commission to prevent discrimination against workers, the extension of the minimum wage law, the increasing of benefits for unemployed workers and workers injured on the job, the establishment of a college for veterans and the liberalizing of pension allowances for persons retired from public service.

The elections of Nov. 1946 resulted as follows: governor, Robert F. Bradford (Rep.); lieutenant governor, Arthur W. Coolidge (Rep.); secretary of state, Frederic W. Cook (Rep.); attorney-general, Clarence Barnes (Rep.); state treasurer, Laurence M. Curtis (Rep.); auditor, Thomas J. Buckley (Dem.).

Education.—In 1946 there were 1,771 public elementary schools with 362,616 pupils and 13,418 teachers; 177 junior high schools with 85,755 pupils and 3,883 teachers; 276 senior high schools with 138,562 pupils and 6,542 teachers. There were 10 teachers' colleges operated by the state, with a total enrolment of 1,952 students and 186 instructors. Total cost of public education in Massachusetts was \$77,245,537.30, of which the commonwealth contributed approximately 9%. Among the institutions of higher learning were: Harvard university (1636), Holy Cross college (1843), Boston college (1863), Wellesley, Williams, Tufts, Massachusetts Institute of Technology, Boston university, Clark university and Springfield Y.M.C.A. college.

Social Insurance and Assistance, Public Welfare and Related Programs.—For 1946 the estimated total of public welfare expenditures by cities and towns (with federal and state aid) was \$61,436,381. Of this amount \$46,054,314 was spent for old age assistance; contributions to this total were: federal 38.7%, state 36.3%, local 25%. There was \$8,496,579 spent as aid to dependent children; contributions: federal 28.2%, state 33.3%, local 38.5%. There was \$6,885,488 spent on general relief; contributions: state 23.6%, local 76.4%. The average monthly case load was: old age assistance 79,856 persons, aid to dependent children 8,159 families, general relief 13,675 cases.

During 1946 the commonwealth spent \$3,344,564 to maintain correctional institutions, including the state prison (520 inmates), prison colony (768), reformatory for men (877), reformatory for women (477), state farm (1,918). The first step in a move to vacate the century-old Charlestown state prison was taken through an appropriation of \$200,000 for construction of the wall to enclose a new prison in Bridgewater.

Other outstanding developments of 1946 included the acquiring, for \$1, of the \$21,000,000 facilities at Camp Myles Standish to serve as a hospital for mentally-retarded children and the establishment of a state-operated system of blood banks to serve emergency needs in every section of Massachusetts.

Banking and Finance.—Revenue receipts of the commonwealth for the fiscal year ending June 30, 1946, were \$159,862,131.14. Governmental cost for the same period was \$175,396,516.62. Net direct debt was

\$25,751,300. Revenue receipts for the first 6 mo. of the fiscal year (July-Dec., 1946) indicated an increase to a record high of \$162,000,000. However, expenditures were also expected to reach a new record, and it was estimated that unless new sources were tapped, revenues would fall \$25,000,000 short. A commission was appointed to study the problem of new taxes, with a view to relieving the commonwealth and local communities.

Particular emphasis was being placed upon the need of increasing state aid to cities and towns for educational purposes. Famous for pioneering in many fields of public education, Massachusetts had fallen to 44th place among the states in terms of state aid for local schools. Gov. Tobin initiated steps to improve this situation, and it was understood that his successor was likewise pledged to use the taxing power of the commonwealth to increase funds available for public schooling in Massachusetts, without increasing the burden on local real estate.

Assessed valuations in the state totalled \$6,250,000,000, and the average local tax rate on real estate was \$35.79 per \$1,000, highest on record. In 1946 Massachusetts citizens paid an aggregate of approximately \$1,500,000,000 in local, state and federal taxes (including real estate, income, excise and others).

GOV. ROBERT F. BRADFORD of Massachusetts, elected on the Republican ticket Nov. 5, 1946

Table I.—Financial Report Covering the Year 1946

Savings banks	190
Co-operative banks	176
Trust companies	64
Credit unions	458
National banks	121
Federal Savings and Loan institutions	26
Total number of all banks in the state	1,035
Total assets of all banks in the state	\$8,777,928,911.27
Total assets, Federal Savings & Loan Assns.	214,050,952.00
Total number of depositors in all banking institutions in the state	4,440,549*

*Does not include depositors of national banks.

Agriculture.—Total acreage harvested in Massachusetts during 1946 was 457,900 ac. The total value of 1946 crops was \$57,446,000, or 29% more than the crop value of 1945.

Table II.—Principal Agricultural Products of Massachusetts, 1946 and 1945

Crops	Production	
	1946	1945
Corn, bu.	1,634,000	1,677,000
Cranberries, bbl.	550,000	478,000
Apples, bu.	1,784,000	410,000
Hay, tons	650,000	662,000
Potatoes, bu.	3,498,000	2,899,000
Tobacco, lb.	10,789,000	8,172,000
Onions, bags	624,000	410,000
Oats, bu.	259,000	196,000
Asparagus, crates	136,000	144,000

Manufacturing.—In 1946 there were 1,799 local unions in the commonwealth with a total membership of 515,370 (374,498 males, 140,872 females), out of a total industrial employment of 1,430,000 persons. Based upon the first 9 mo., pay rolls for 1946 were estimated at \$12,100,000,000, not including public service groups, farm workers and others not covered by social security. In 1946 the division of unemployment security paid out \$42,857,363 to jobless workers, and \$68,663,916 to returned veterans seeking work—a total of \$111,521,279.

Table III.—Value of Principal Products Manufactured in Massachusetts in 1946

Products	Estimated Value
Woollen and worsted goods	\$ 534,000,000
Electrical machinery, etc.	415,000,000
Cotton goods	359,000,000
Boots and shoes (other than rubber)	325,000,000
Clothing	216,000,000
Foundry and machine shop products	188,000,000
Rubber goods	175,000,000
Printing and publishing	149,000,000
Paper and wood pulp	144,000,000
Bakery products	143,000,000
Leather	132,000,000
Boots and shoes, stock and findings	130,000,000
Shipbuilding	86,000,000
All other industries	2,204,000,000
Total value	\$5,200,000,000

(M. J. To.)

Massachusetts Institute of Technology.

The year 1946 was one of transition from wartime research to the peacetime education of a student body of outstanding maturity and capacity. To fulfill its obligation to readmit all its former students on leave of absence for military service and to help alleviate the postwar educational challenge as shown by about 75,000 inquiries concerning admission to M.I.T. after V-J day, the institute enrolled 5,100 students in Sept. 1946, an increase of 70% over the normal prewar student body of 3,000. Of the total student body, 1,300 were graduate students, of whom many were selected army and navy officers sent for special training. Three-fifths of the 1946 student body were veterans.

To provide adequate academic facilities for the abnormally large student body, the institute occupied all the space devoted to war projects, with the result that its plant was greater by 500,000 sq.ft. than that available before the war. Its educational effectiveness had been extended by several significant developments, including the completion of plans for the Charles Hayden Memorial library; the establishment of two new centres of research—the research laboratory of electronics and the laboratory for nuclear science and engineering; the construction of a new gas turbine laboratory; and the launching of a new department of food technology. Government and industry continued to sponsor research at M.I.T. on an extensive scale. Of its over-all budget of \$11,000,000, the institute's research budget for 1946 was of the order of \$5,000,000.

(For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (K. T. C.)

Mathematics. By the end of 1946 mathematical research had returned to a normal level in most countries, although publication had not been resumed in Germany and Japan. Attendance at mathematical meetings and the volume of publication both increased materially. The first international conferences of any size after 1939 were the Sixth International Congress for Applied Mechanics, held in Paris in Sept. 1946, and the Conference on the Problems of Mathematics held in Princeton, N.J., in December as part of the bicentennial celebration of Princeton university. The American Mathematical society's annual colloquium lectures were delivered by Hassler Whitney (*Topology of Smooth Manifolds*).

International communications had not improved enough for all mathematical publications for the war years to have reached all countries, but a reasonably large sample was available in the United States and Great Britain. The first publications received from Japan showed that, during the five years in which Japan had been cut off from the rest of the world, mathematics had developed along lines parallel to its development elsewhere; several results had been discovered independently by investigators in Japan and in the west.

Few advanced mathematical books were published, although many were in preparation. C. Chevalley's *Theory of Lie Groups* contained much original material. H. Cramér's *Mathematical Methods of Statistics* seemed destined to be the standard reference book on the subject for some years to come.

During the war many novel computing machines were constructed. Details of some of the outstanding ones were released to the public in 1946. The E.N.I.A.C. (initials of "electronic numerical integrator and computer"), at the University of Pennsylvania, is a high-speed machine using electronic apparatus. The somewhat slower, but perhaps more versatile, automatic sequence controlled calculator at Harvard university uses International Business Machines equipment. Such machines perform single additions or multiplications on numbers of ten or more

digits in times ranging from a small fraction of a second to a few seconds, and will solve in a few hours problems which would take a manual computer months. They are of particular importance for applied mathematics. A new and powerful differential analyzer at Massachusetts Institute of Technology should also be mentioned.

Among investigations which attracted particular attention in 1946 were the theory of compressible fluids, under intensive study by many mathematicians. Another problem in hydrodynamics, that of the stability of a flow, was attacked with success by C. C. Lin. In the theory of the area of a curved surface, developments of the year served to emphasize the fact that different definitions lead to remarkably different results above the elementary level. A problem concerned with the topological characterization of the sphere was solved by R. H. Bing. Connections between topology and the theory of groups were developed, particularly by S. Eilenberg and S. MacLane. Other contributions to algebra which attracted attention were made by R. Brauer, E. Artin, I. S. Cohen and N. Jacobson. Number theory continued to be active; K. Mahler and others in Great Britain worked on the geometry of numbers and Diophantine approximation, while U. Linnik in the U.S.S.R. made further advances in analytic number theory. The American Mathematical society's Cole prize in the theory of numbers was awarded to H. B. Mann for his solution in 1942 of the problem of the density of the sum of two sets of positive integers. A new approach to N. Wiener's general Tauberian theorems was given by A. Beurling. The first significant contribution to the mean convergence of series of orthogonal polynomials was given by H. Pollard.

BIBLIOGRAPHY.—A complete bibliography of papers in pure and applied mathematics is given in the abstracting journal *Mathematical Reviews*, vols. 7 and 8 (1946 and 1947). (R. P. Bo.)

Meat. The production of all meats in the United States in 1946 was estimated by the United States department of agriculture at 21,900,000,000 lb. compared with 22,081,000,000 lb. in 1945 and the five-year average of 16,182,000,000 lb., 1935-39. Production in 1946 was the lowest from 1942 because of the lower production of pork. The civilian consumers had a larger supply than a year earlier, however, as a result of the larger supplies moving after the end of price control and the advance in livestock prices. Meat output during the first half of the year was about the same as in the first half of 1945. Military requirements were smaller, but larger amounts were purchased for export for relief and sale. In May the movement of livestock to market slowed as farmers were waiting the end of price control. At times receipts of live animals were at record low numbers at the principal stock yards. In July and August, when price control lapsed, the receiving yards were crowded. Some animals were marketed in unfinished condition in order to meet the higher prices that followed de-control. This caused a slight decline in receipts in September and meat production dropped to a low level.

Total meat production was estimated at 161 lb. per capita in 1946 compared with 163 lb. in 1945 and the record of 178 lb. in 1944. Exports were estimated at 1,300,000,000 lb. in 1946 which was more than was shipped in 1945 but only about half of the high record shipments of 2,531,000,000 lb. in 1943. The meat production of 1946 was below 1945 for beef, veal and mutton but slightly larger for pork. Veal declined about 14%, beef 13% and lamb and mutton 5% while pork gained 3%.

The commercial meat stocks were the lowest on record in September because of the reduced September production and heavy consumption. The average civilian consumption was estimated at 145 lb. per capita for 1946 compared with 137.7 lb. in 1945, 148.4 lb. in 1944, 136.7 lb. in 1943 and a prewar average of 125.6 lb., 1935-39. The demand for meat continued high until late fall when employment was reduced somewhat by strikes.

Military purchases were estimated at 750,000,000 lb. compared with 3,600,000,000 lb. purchased in 1945. Exports and other shipments were about 1,200,000,000 lb. compared with 1,400,000,000 in 1945. The government stopped purchasing meat for export on Sept. 30. Purchases for relief by the United Nations Relief and Rehabilitation administration declined to the end of the year when this organization terminated its activities.

Prices of meat animals increased beyond all records beginning in July 1946, from 206% of the base (1909-14) in Aug. 1945 to 294% in November. Hogs, cattle, calves and lambs made new high records in July and August, then dropped again when control was restored in September, only to jump again in October to higher levels than had been reached in August. The price of beef cattle to producers averaged \$14.10 per 100 lb. in June, then rose to \$17 in August, dropped to \$15.20 in September and reached a peak of \$18.10 in October followed by a slight decline to the end of the year. Retail prices of beef followed a similar series of changes. The top price at Chicago for a few loads of steers in late August was \$30.25 per 100 lb. compared with the previous high record of \$21.50 in Dec. 1919. Hogs, which had been stable at around \$14 per 100 lb. through 1945 and up to June 1946, advanced to \$20.80 per 100 lb. in August, declined to \$15.70 in September and then made a record of \$23 for October which was followed by a slight decline. Veal and mutton followed the same general trend.

The pork supply of 1946 was the result of a larger fall pig crop in 1945 than a year earlier which increased the market supply in early 1946. The spring pig crop in 1946 showed a slight increase over the previous year but the fall pig crop of 1946 declined because of the high prices of feed in the spring. This would be reflected in smaller marketings in the winter of 1947. Large feed supplies from the record crop of 1946 encouraged feeding to heavier weights, however, which would increase the supply of pork for early 1947. The United States department of agriculture asked farmers for a larger spring pig crop in 1947 than in 1946.

The number of cattle on farms declined in 1945 from 81,909,000 head to 79,791,000 head on Jan. 1, 1946. This was a small decline and was checked during the year. The number of cattle on feed on Jan. 1, 1946, was 5% below a year earlier and by April the number being fed in the corn belt was estimated to be 15% less than in 1945. With the increase in prices and good crop prospects the movement of cattle to feed-lots increased in July and August more than 64% above the previous year. While prices of feeder cattle were high, feed supplies were abundant and profits were stimulating to feeding.

Sheep and lamb production declined after 1942 and the 1946 lamb crop was 26,000,000 head, the smallest after 1927. Lamb feeding was maintained at near the record of 6,979,000 head in 1943 with 6,724,000 head fed in 1946. (See also BACON; CAT-

U.S. Meat Production, 1946, 1945 and 10-year Average
(In millions of pounds, dressed weight)

	Average 1935-39	1946*	1945
Beef	6,936	8,700	10,157
Veal	1,038	1,400	1,635
Lamb and Mutton	871	1,000	1,053
Pork	7,337	10,200	10,046

Medical Rehabilitation of Disabled Veterans.

Steady progress was being made in the development and achievement of medical rehabilitation for war-disabled veterans. The impetus provided by World War II continued in the effort to rehabilitate every sick, injured and disabled veteran for purposeful living and a normal life compatible with his abilities and disabilities. The finer concepts for restoration and re-socialization of these men who had earned their recovery even before they received their disability in combat were conceived as part of an integrated program in which medical rehabilitation brought to bear every possible therapeutic means to treat the whole man, to engender a desire to get well, to enhance his morale and confidence and to guide his vocational abilities toward economic independence.

In order that veterans might receive medical care second to none in the world, liaison was established between the Veterans' administration and the leading medical schools and centres throughout the country. From these medical schools, deans' committees were established for each hospital, and prominent physiatrists were appointed to serve as consultants in physical medicine to Veterans' administration hospitals. The medical rehabilitation service continued to develop through decentralized branch areas with supervision over the rehabilitation program in every hospital within their respective areas.

Physical medicine was expanded in accordance with principles established by the Baruch Committee on Physical Medicine to include all newer techniques and modern apparatus in this specialized field. The preventive, diagnostic and therapeutic phases of physical therapy were supplemented by the broad application of rehabilitative therapy—thus truly emphasizing the third phase of medicine.

Corrective physical rehabilitation was inaugurated and established as a new service for the prevention of deconditioning phenomena in hospitalized veterans; thus there was prevention of muscle atrophy, with all exercise scientifically guided and increased proportionately according to the patient's physical tolerance.

Occupational therapy became a broadened field, concerned not only with diversional exercise in order to prevent unhealthy introspection, but geared toward functional activity to restore usefulness, to provide suitable handicrafts and arts and to co-ordinate with scientific procedures designed to aid recovery for vocational ends.

An innovation was the establishment of educational retraining and prevocational shop retraining as parts of the component services to the veteran. The former embraced a form of medical rehabilitation which utilized educational courses as therapy to stimulate, motivate and activate the minds of veterans through activities designed to raise their educational levels, develop occupational skills and to promote new academic interests, therefore accelerating the veteran's return to useful, normal living. The latter was executed as a therapeutic utilization at the prevocational level of projects of industrial, agricultural or trade nature, into which the veteran entered to explore the possibilities and determine the feasibilities of continuing such

activities as a post-hospital vocation with economic possibilities, or as a field for further training following his discharge from the hospital.

A program of aural rehabilitation was initiated to aid the deafened and hard-of-hearing veteran so that he might profit by all strides made in this field by research and clinical experience during World War II. It was estimated that there were about 36,000 veterans with ear casualties from World War II who were service-connected for their disability which was incurred by the blast of explosives, the din of battle and systemic or auditory infection. It was shown that the hard-of-hearing veteran frequently did not do well in his vocational rehabilitation training. Therefore, it was apparent that expert guidance and intensive rehabilitation were essential for these men.

Rehabilitation for the blind and partially blind veteran continued to develop in the nine blind centres which had been established for complete evaluation of visual defects and the study of personality problems of these veterans to help them in readjustment and to aid them in the recovery of economic usefulness.

Further progressive development was recorded in the rehabilitation of veterans with spinal cord injuries. Six centres were established for these men. More than 1,000 of these paralyzed veterans were given the most modern rehabilitative therapy so as to enable them to become ambulatory, care for their daily needs and engage in remunerative occupations. Selected groups of these veterans were flown by air to medical and scientific meetings to demonstrate their achievements, thus serving to educate civilian physicians and agencies in the newer aspects of this field.

In all general medical and surgical hospitals the countless disabilities resulting from medical and surgical conditions were evaluated and proper measures taken for complete rehabilitation. The neuropsychiatric hospitals stressed mental as well as physical rehabilitation. Mentally ill veterans with native abilities, former training and commercial, industrial and academic experience were prepared for their eventual return to society. In the tuberculosis hospitals, veterans were guided through tedious days and months of convalescence; they were advised, furnished with basic instruction and eventually placed in appropriate occupations so as not to break down in a few months. A former problem, wherein these veterans became disgusted, careless and finally reckless of their own welfare, that of their family and of their community, thus was solved. The tuberculous veteran was protected from reactivation of the disease and other workers and their families were protected from exposure to active disease.

(P. R. Hy.)

Medicine. New uses for new antibiotic drugs, like penicillin and streptomycin, and new discoveries in the field of atomic energy were the apex of medical interest in 1946.

Atomic energy experts believe that developments in atomic physics advanced cancer research by 20 years. Organic substances like carbon and hydrogen as well as inorganic substances like calcium and iodine can be made radioactive through the use of the cyclotron. These radioactive compounds can be traced through the body. Even antibodies against infection can be attached to isotopes and traced to the point of ultimate deposit in the body. This technique can help, moreover, in determining how cancer tissue develops from normal tissue. Radioactive iodine when taken into the body goes directly into the thyroid gland. By the use of this technique, tumours and excessive activity of the thyroid gland were treated successfully.

When sodium salt is made radioactive, the atoms are tagged. These are known as radioactive isotopes and can be traced throughout the system. Doctors injected people with disturb-

ances of the circulation with radioactive sodium and followed it through the body. Thus they were able to show whether or not any of the blood vessels were partially or totally blocked. By this technique they were able to find out in cases of amputation of the limb because of blocking of the blood vessels the point at which to operate. In many instances they were able to operate below the knee joint instead of above it.

Radioactive phosphorus can be administered without harm to human beings and is used to reduce the production of white blood cells in conditions like leukaemia and Hodgkin's disease as well as excessive production of red blood cells in conditions like polycythaemia. Radioactive phosphorus was used in solution as a direct application to warts, moles and other small tumours of the skin. Doctors report that application of a small amount to such tumours for three or four days caused the tumours to fall off.

Other radioactive substances may perhaps go directly to cancer cells in other portions of the body and act upon them. (See also CANCER.)

Antibiotic Drugs.—The antibiotic drugs were found useful in treating successfully a great variety of diseases formerly uncontrollable. The sulfonamide drugs were used to treat a variety of conditions such as pneumonia, meningitis, gonorrhoea and various pus infections. Such sulfonamides as promizole and diasone were used with benefit in leprosy. Penicillin was successfully used in controlling many conditions but especially offered new hope for the control of syphilis. Streptomycin was practically specific against tularaemia and extended investigations were being made to find out just how it could be used against tuberculosis.

New techniques for using penicillin involved incorporation of the drug in lozenges to be kept in the mouth for infections of the throat and in sprays, known as aerosols, which were especially effective for infections of the lungs.

Tablets of penicillin were developed which could be taken by mouth in doses of 50,000 and 100,000 units. About three times the dosage is required when the drug is taken by mouth instead of by injection.

Folic Acid or the L. Casei Factor.—Newest among the substances of a vitamin character was folic acid, called L. casei factor. Disturbances of the blood because of improper development of red blood cells as well as some skin diseases and conditions of the nervous system of the type that appear in pellagra were found to be due, at least in part, to a deficiency of this material in the body. The material is derived from yeast. Some of the conditions, like pernicious anaemia which was relieved by large doses of liver extract, also would yield to this new vitamin substance. (See also VITAMINS.)

Curare.—During the year 1946 extensive experimentation with curare, the South American arrow poison, and with a purified extract called intocostin showed that this drug could be used to control activity of nerves that made muscles spastic. Its special use was as an inoculation before anaesthesia so that the muscles relaxed much more easily and permitted the use of much less of the anaesthetic. A second use is for the treatment of various forms of spastic paralysis, including particularly soldiers who had had an injury of the spinal cord and also children born with brain haemorrhages which produced spasticity.

Blood Derivatives.—As World War II ended, experts summarized the advances in the use of blood and blood derivatives as follows: the war demonstrated the importance of whole blood transfusion in repairing the results of haemorrhage and in overcoming the damage done by shock. When a large amount of blood is lost, replacement with plasma means that there will be anaemia, which is avoided when whole blood is used. Whole blood can be stored for three or four weeks by mixing with acid

STREPTOMYCIN being prepared in the research laboratories of Merck and Company, Rahway, N.J., during 1946. After incubation and maximum growth, the bacterial cultures in these bottles are removed and the medium containing streptomycin is harvested

citrate dextrose and a small amount of glucose. Second important product is resuspended red blood cells, useful whenever there is a deficiency of red cells and particularly in leukaemia and various forms of anaemia. Research endeavoured to find a substance for use in resuspending the red cells, which live in salt solution about five days but possibly much longer in corn syrup.

Plasma can be preserved dry and is reconstituted with water for use. Its special value is to substitute for whole blood in haemorrhage, to replace fluid lost in burns and to replace protein lost from the blood such as occurs in nephrosis and in other conditions. From the plasma certain fractions are developed which also have value. These include substances important to coagulation of the blood like fibrin foam, thrombin and fibrin film. One fraction was found useful against haemophilia and was being studied for that disease.

Gamma globulin was used as a preventive of measles and infectious inflammation of the liver but failed in preventing mumps, chickenpox or infantile paralysis. Studies were to be made on other infections.

Preparations were obtained which were useful in determining the classification of the blood in relation to its typing.

The albumin from the blood when reconstituted with fluid was used in the treatment of shock and in cases in which there was a lack of blood proteins. The albumin is preferable to the whole plasma because it contains less salt, and salt aggravates certain forms of dropsy or oedema. Other globulins are the alpha and beta globulins, which are related to the presence in the circulation of fat as well as some of the glandular principles. On these there was continuing research.

Antihistamine drugs.—French investigators produced a sub-

stance which acted against histamine, a chemical that is released into the blood and the other cells when there are manifestations of sensitivity to various protein substances as occurs in allergic conditions like urticaria, hay fever and asthma. In the United States improvements were made on the French preparation known as antergan, and two products were distributed called benadryl and pyribenzamine. Physicians found these preparations well nigh specific against urticaria and food sensitivities and exceedingly useful in many cases of hay fever and asthma. Some cases were reported in which the use of benadryl made the user somewhat sleepy.

Fertility Control by Recording Temperature.—Doctors know that the body temperature varies according to many factors. A record of the temperature every hour shows there are definite fluctuations during a 24-hour period which follow a pattern. Records made on many hundreds of women show that the temperature drops from 24 to 36 hours before the onset of the period and reaches a low level during the first day or two after the beginning of the period. This low level continues during the entire period and up to the time when the ovary gives off the egg cell. Typically a sharp drop in the temperature occurs just before the time when the ovary acts, rises again promptly and remains at a level until 24 to 48 hours before the beginning of menstruation in the following period, when it drops again. This enables the woman who takes her temperature in the morning before arising at the same time every day and keeps a careful record to determine the time of ovulation. Conception with subsequent pregnancy is most likely in the three-day period following ovulation. In the majority of women who became pregnant while under study pregnancy followed sex contact during the period of temperature rise following the drop before ovulation and immediately after the temperature reached its upper plateau. This narrows the fertile period to approximately three days.

Influenza Vaccines.—Continued studies with vaccines against influenza developed in war research indicated the possibility of immunizing people against the viruses known to cause influenza A and influenza B and the Australian virus. Since the serious symptoms of epidemic influenza are related to initial infection by the virus with subsequent infection by germs of the streptococcus type, inoculation against influenzal virus and control of streptococci by the use of the antibiotic drugs would seem to indicate the possibility of adequate control of epidemic influenza in future outbreaks. People sensitive to egg have reactions following injection of the vaccine since the virus is cultivated on fertile eggs.

Glandular Studies.—Investigators reported that the use of the female sex hormone stilboestrol can stop the growth of cells in cancer of the prostate and that similarly use of the male sex hormone testosterone was effective in early cases of cancer of the female breast.

Bogomolets Serum.—Much publicity was given to the Bogomolets ACS or anticytotoxic serum. U.S. controlled studies proved that the serum is without value in cancer and that it cannot prolong life. British physicians proved that the serum was not effective in treating arthritis. Some experimental evidence indicated its value in stimulating broken bones and tissues to heal more rapidly.

Protein and Amino Acids.—Concentrated protein substances, consisting of individual amino acids which are the constituents of protein, were undergoing active investigation in many clinics. These protein mixtures are made from casein or meat digested by acids or enzymes. They are used in surgery before and after operations to overcome the danger of loss of protein in surgical patients. They are used in medicine in the treatment of ulcerative colitis and various forms of gastro-intestinal disturbances

in which there may be total or partial starvation because of difficulties of digestion.

One of these proteins, known as methionine, was found especially useful in cases of cirrhosis or hardening of the liver in which there is inability of the tissues to supply the necessary methionine for the health and growth of the body.

Prevention of Congenital Defects.—Well established by research was the danger of German measles to prospective mothers during the first three months of pregnancy. Apparently the virus can get through the placenta or afterbirth and damage the growing cells of the child. This damage results in such conditions as congenital cataracts and blindness as well as other defects of the eye, incomplete formation of the heart and similar deformities. Specialists considered the desirability of prevention of childbirth when the mother had German measles during the first three months of pregnancy.

Heparin and Dicoumarol.—Two drugs known as heparin and dicoumarol have the power to prevent clotting of the blood. They were being used to prevent deaths of patients who formerly might have died of clots of the blood after surgical operations. The drugs were used also in connection with the use of the antibiotic drugs to prevent the formation of clots when there are infections of the blood vessels or heart.

BAL, Nitrogen Mustards and DFP.—The British developed a product called BAL or British anti-lewisite as an antidote of poisons by use of this war gas. This antidote was used in medical practice as a treatment for arsenical and mercury poisoning and was especially valuable in reactions to arsenic used in the treatment of syphilis. BAL was also found to be useful in preventing reactions from gold salts injected in the treatment of arthritis.

Among studies on mustard gases came products called nitrogen mustard which are useful in destroying excessive white blood cells in cases like Hodgkin's disease and lymphatic leucemia.

A product known as DFP or diisopropyl fluorophosphate has an effect on transmission of the nerve impulses and was being used in cases of myasthenia in which it apparently increases muscle strength. Its successful use was also reported in the treatment of glaucoma for decreasing excessive tension in the

LABORATORY WORKER bending over a tray of bottles at one stage in the process of producing dried amino acids which, during 1946, were effectively used in treating starvation cases among the people of Europe

eye which destroys eyesight in this disease.

Surgery.—Most sensational surgery was the operation performed on the blood vessels and the heart in cases in which babies were born with unsatisfactory development so that the blood did not pass properly through the lung and thus failed to secure the necessary amount of oxygen. Surgeons in Johns Hopkins university, Baltimore, Md., developed an operative procedure for transplanting the blood vessels successfully. As the year closed, other surgeons worked out a technique for transplanting blood vessels carrying blood to the lung directly to the aorta, or large blood vessel passing from the heart. Necessary for this procedure was the invention of special clamping devices to permit the flow of blood to the rest of the body during the operation and at the same time to restrict the flow to such a small stream that patients would not die from haemorrhage during the operation.

Much attention was given also to an operation on the vagus nerve called vagotomy for the prevention and treatment of peptic ulcer.

Artificial eyes prepared from plastic materials were developed and a technique found for sealing them in the eye socket with tantalum wire. (See also SURGERY.)

Neuropsychiatry.—Increased attention to neuropsychiatric medicine resulted from the discharge of a tremendous number of men before their acceptance by the army or during their military service because of nervous breakdowns. An eminent psychiatrist said that many young men were still tied to their mothers' apron strings and that "Mom" failed to teach her children independence of thought and action. He said that mother-attachment caused 350,000 U.S. boys either to evade military service, attempt to do so or to become psychiatric cases after a few months of training. Special organizations in this field developed programs and techniques for meeting the needs of the situation during the years following the war. (See also PSYCHIATRY.)

Social Medicine.—After hearings extending several months, the congress of the United States failed to consider the legislation that proposed a nation-wide system of compulsory sickness insurance. The congress passed, however, the hospitalization and health centre bill which provided for the building of additional hospitals and health centres where the need could be shown and where communities would be able to administer such institutions successfully. The congress increased appropriations for public health activities carried out through the Federal Security agency. The congress failed to pass the National Science Foundation bill which would greatly have extended opportunities for research in science. It also failed to consider any of the measures providing vast funds for research against cancer. In an address by Senator Robert Taft late in Dec. 1946 he promised promotion of federal legislation to aid the states in caring for the indigent and medically indigent and in encouraging voluntary sickness and hospitalization insurance. He said he would urge also the passage of a national science foundation bill which would place the authority in a board of 50 scientists. Mediterranean, British Possessions in the.

These comprise Cyprus, Gibraltar and the Maltese islands, of which the accompanying table gives certain statistics (see also BRITISH EMPIRE).

Gibraltar.—At the beginning of 1946 Gibraltar was still faced with the task of completing the repatriation of its civilian inhabitants. The total number evacuated during World War II, on grounds of military security, was about 16,700; some of the evacuees went to Jamaica and others to Madeira, but the majority were settled in London where suitable arrangements were made for them. At a later stage of the war (as a consequence of the flying bomb attacks on London) they had to be removed to safer but less comfortable quarters in Northern Ireland. By the middle of Jan. 1946 some 12,000 persons in all had been permitted to return to Gibraltar. Of those still awaiting repatriation, nearly 3,000 remained in Northern Ireland; by Oct. 1946 the figure stood at approximately 2,050. The problem of further repatriation presented many difficulties; its final accomplishment depended on progress made with local housing schemes, in default of which further additions to the already overcrowded local community could not be absorbed.

There was some dissatisfaction among evacuees whose return to their homes was delayed. Late in the year the Gibraltar government signed a contract with a British firm for the construction of 472 flats at a cost of about £1,700,000. The general political situation in the colony remained quiet. Considerable progress was made in restoring health and educational services to their peacetime footing. Lt. Gen. Sir Ralph Eastwood (appointed in Feb. 1944) held the post of the governor of Gibraltar throughout the year.

Malta.—The appointment of a civilian governor, which was announced in May 1946 after the resignation of Lt. Gen. Sir Edmond Schreiber on grounds of health, marked a departure from the long-established practice by which Malta was regarded as one of the "fortress" territories of the British colonial empire where officers of high military rank were regularly appointed to the governorship.

The choice of the British government for the governorship fell upon F.C.R. Douglas, a former chairman of the finance committee of the London County council and of the estimates committee of the British house of commons. Mr. Douglas assumed office on July 10. In making the appointment, the government had regard, as was explained by their spokesman in the house of lords, to the "acutely pressing problems connected with constitutional changes and financial and

economic adjustment" with which the colony was confronted; it was considered that these abnormal conditions could best be handled by a governor with previous experience in the field of civil and financial administration.

Malta was faced with two major problems throughout the year: first, the repair of the very extensive damage suffered through enemy action during World War II; and second, the elaboration of a new constitution, on "self-governing" lines, in pursuance of the pledge given by the British government in 1943. Progress was made in both directions. A free grant of £10,000,000 from the British exchequer for purposes of restoration of war damage had been approved in 1942. The amount proved wholly insufficient; and it was officially announced in July 1946 (after the situation had been investigated by a financial expert sent out from England) that the British parliament would be invited to provide a further sum of £20,000,000 for the same purpose. It was explained that the special object of grant was to ensure that the new constitution, then in process of formation, should not be unduly handicapped from the outset by financial burdens arising out of the war. A Maltese national assembly, charged with the task of framing the new constitution, had been set up in Jan. 1945 and had appointed a constitutional committee from among its members to work out the details of the plan. In the spring of 1946 a constitutional commissioner (Sir Harold MacMichael) was sent out from England to assist the local delegates in their task. On his return to England in Sept., he was able to report that agreements had been reached by the committee and had been endorsed by the national assembly. It was announced in Dec. that a parliamentary paper would shortly be published containing the report of the constitutional commissioner and the proposals of the British government in regard to the new constitution.

The government of Malta encountered many difficulties in dealing with immediate postwar conditions in the island. The problem of employment, aggravated by the prospect of discharges of personnel from the admiralty dockyard, caused serious anxiety and became the subject of much local criticism of the authorities. In Sept. 1946 all the elected representatives of the Labour party resigned from the council of government as a gesture of dissatisfaction with the economic situation and the alleged inadequacy of the measures taken to cope with it.

Cyprus.—The general political situation in Cyprus underwent no great change during the year 1946. The legislative council remained in abeyance (it had been suspended in 1931, as a result of serious disturbances in the island), and in its place an advisory council, containing a majority of unofficial members, continued to function. On Oct. 23 it was announced that a consultative assembly was to be called together in the island to consider the framing of proposals for constitutional reform, including the re-establishment of a central legislature. The other events of the year were concerned with economic rather than with political development. The economic needs of Cyprus, more especially in the matter of irrigation, had already received active attention from the British government. In 1945 a special development commissioner (Sir Douglas Harris) was sent to the colony with a view to drawing up a ten-year program of development. His report was submitted in Aug. 1945 and a continuation report was presented in May 1946 by a local committee under the chairmanship of the colonial secretary. Sir D. Harris' comprehensive plans contemplated increased expenditure, spread over a ten-year period, of more than £4,500,000 (capital expenditure £2,700,000; recurring expenditure £1,800,000). The services to which it was proposed to allocate the money were education, irrigation, medical, forests, agriculture and antimalarial work. The continuation report envisaged further expenditure of some £1,250,000 to be allocated to such services as roads, village development and holiday resorts. Sir Charles Woolley (appointed 1941) held the post of governor of Cyprus during the greater part of the year. His transfer to the governorship of British Guiana was announced in Oct. 1946. Lord Reginald Winstler was appointed as his successor. (J. Sg.)

Meek, Donald (1880-1946), British character actor, was born on July 14 in Glasgow, Scotland. As a young boy he toured Australia in *Little Lord Fauntleroy* and at the age of 14 became an acrobat. He relinquished this profession in favour of the stage after he was hospitalized by a

serious accident which occurred while he was performing in a human pyramid stunt. He subsequently appeared on the stage with promising success, but interrupted his career to fight in the Spanish-American War. He later made his debut on Broadway (1913), but when World War I started he joined the Canadian Highlanders.

Following the war, he went on a tour of South Africa, India and Australia and returned to Broadway. In 1928, he was first seen in motion pictures where he made fame as a character actor with his portrayals of the confused and ineffectual average man—the Mr. Milquetoast of the screen. A veteran of 58 years on the stage and screen, he played in more than 800 roles and appeared in more than 100 films. He died in Hollywood, Calif., on Nov. 18.

Mercury. Production of the more important countries is shown in the accompanying table, so far as data were received in 1946.

United States.—Mercury production almost trebled in volume during World War II, increasing from 708 short tons in 1939 to 1,973 tons in 1943, but with the passing of the peak of war demand, dropped back to 1,169 tons in 1945. Imports dropped from 1,817 tons in 1943 to 743 tons in 1944, but with the relaxation of war controls, the growing civilian demand and the declining domestic output raised imports to 2,608 tons in 1945.

Consumption declined from 2,071 tons in 1943 to 1,630 tons in 1944, but rose to 2,428 tons in 1945—17% greater than the peak year of war demand. In the first half of 1946 production dropped still further, to 477 tons, imports to 222 tons and consumption to 585 tons. The relatively heavy consumption of the first nine months of 1945, greater than the full year 1944, was due to the development of a new type of dry battery using mercury as an active ingredient, and military demand for the time being put this use at the top of the list of mercury consumption.

Canada.—At the expiration of the Metals Reserve contract for the purchase of the Canadian output, production was dis-

Metallurgy. During the war years the emphasis was on production, rather than on methods, and new developments in metallurgical procedure were generally not attempted unless they promised to lead to the solution of a vexing production problem. Hence, many of the advances accomplished were concerned with matters that for security reasons could not be made public at the time. In 1946, with World War II over and the veil of secrecy lifted, many new and striking developments in metallurgical detail were revealed, but relatively little about changes in fundamental process metallurgy.

Investigators sent into enemy countries after the close of the war were reporting their findings with respect to metallurgical developments during the war years. While some of the methods reported could be adapted for use in peacetime industry, much of the work done was concerned with the best utilization of low-grade materials or substitutes, made necessary by the shortage of raw materials.

Although many of the new processes and products would be adapted to peacetime industry, others would disappear, having been useful only for the time or need for which they were devised. The same comment applies to many types of new equipment; some could be used directly; others could be adapted to similar peacetime uses; but some would be of about as much use as a worn-out obsolete bomber—not because of any lack in their suitability for the use for which they were designed, but because that use no longer existed.

Aluminum.—A new aluminum alloy containing beryllium, along with copper or copper and cobalt, was reported to develop high strength in castings made by sand, centrifugal or lost-wax methods, and to have unusual oxidation-corrosion resistance.

Germanium.—A gold-germanium eutectic (12% Ge, melting point 673°F.) can be used as solder in repair work. It was said to be harder than ordinary gold alloys and to have good wearing qualities.

Lead.—In Canada and Australia advances were made in blast furnace operation, particularly in the widening of the furnace. Changes were also made in bosh design, including a double set of tuyères. One interesting new feature resulted directly from manpower shortage; lead pigs piled in ears for inter-plant movement usually were shifted so much that repiling was necessary before the usual forked truck could be used for unloading; the new procedure was to cast the metal in 10-ton blocks, for handling by crane.

In World War II, lead had furnished more than ammunition. Storage batteries for submarines and mechanized land equipment were a major item. An almost fantastic procedure was the laying of an armoured lead pipe under the English channel, through which the gasoline supply for the invasion of Europe was pumped from Britain to the Normandy beach. Also the gasoline itself had been treated with lead tetraethyl to improve its performance in plane and truck engines. Lead protective shields played a significant part in handling the radioactive materials going into the construction of the atomic bomb.

Stainless Steel.—The addition of antimony to 18-8 and plain chromium stainless steels reduces corrosion by hydrochloric, sulphuric and acetic acids.

Tungsten.—Bearings of tungsten carbide, used on a precision grinder, showed exceedingly low wear.

Continuous Casting.—An innovation in nonferrous technology was the substitution of rolling by a process of continuous

casting, in which liquid metal is converted into unlimited lengths of rod or other shape of constant cross section. The method is particularly applicable to brass, copper, aluminum and magnesium, and had been used to a limited extent with steel. The same procedure had been applied to sheet and strip, but only to a minor degree.

Electron Microscopy.—Marked advances were made in the simplification of equipment, while at the same time the magnifying power and resolution were greatly increased.

Radiography.—The scope of X-ray radiography was extended to 12 in. of metal by the use of a new 2,000,000 volt X-ray machine.

X-ray diffraction methods were successfully applied in the nondestructive testing of the bonding of an electrodeposited metal to the base metal, the investigation of electrodeposited alloys, and in studying the diffusion of indium plating into lead in aircraft bearings.

Welding.—A new system of welding was introduced in which the usual welding rod is replaced by powdered metal and flux, fed into the flame through the tip of the torch. (*See also* ATOMIC ENERGY.)

(G. A. Ro.)

Metal Prices and Production: *see* MINERAL AND METAL PRODUCTION AND PRICES.

Meteorology. Perhaps most significant for the future of the science, both theoretical and applied, was the progress represented in the growing accumulation of valuable meteorological data of the atmosphere as a whole and the acquisition of many competent young scientists with training and experience during 1939-45 for research and service in this field. Added also was the increased support and incentive given by businessmen, industrialists and people in general who had become thoroughly "weather conscious" and no longer looked upon it as something unforeseeable and incalculable in their daily plans but rather insisted upon taking the weather elements into account among the calculated risks in their operating plans. They knew that weather was one of the important factors in military planning during World War II and that weather reports and forecasts had been used with great success for this purpose. It was indispensable to successful co-ordination of the complicated operations of the several military arms on land, at sea and in the air.

A few prominent scientists, more imaginative than others, even talked seriously during 1946 about the possibilities of modifying weather conditions locally to serve public welfare. They visualized something more extensive than the very limited measures of weather "control" already in use in the artificial heating of the air in orchards to protect the trees and fruit from freezing and the clearing of fog from airports by artificial coalescence of fog droplets or by evaporation through artificial heating. Among the most publicized was the proposal to prevent the heavy damage that hurricanes often cause by destroying or deflecting the storm whenever large population centres lie in its path. The plan would be to detect the atmospheric conditions conducive to formation of hurricanes and to dissipate the potential energy responsible for their formation while still in the incipient stages. The idea in one form or another had often been suggested, some advocates believing that the hurricane could be destroyed by gunfire while others would use bombs or large-scale bonfires to release the potential energy here and there locally, perhaps as thunderstorms, and thus prevent its being concentrated into a severe hurricane. Prior to 1945 scientists had calculated that the idea was impracticable because of the magnitude of the forces responsible for formation of tropical cyclones or hurricanes, and the broad

geographical extent of such storms; but with the possibilities of atomic energy and its enormous production of heat, the need to review the question was recognized and further studies were begun. A noteworthy aspect of the problem was the importance of proceeding with care if practical tests were undertaken, to avoid the artificial formation of hurricanes or an increase instead of a decrease in intensity of a storm already formed.

In the imaginary realm of large-scale weather control the shelter belt schemes of the droughty 1930s whereby the planting of trees on the U.S. prairies was to bring rain to the "dust bowl" had been generally discounted, as meteorologists predicted, although they readily agreed with agricultural and hydrologic engineers that reforestation would result in retention of moisture by the soil and reduction of excessive and harmful run-off of water from rainfall and snow melt. But perhaps of more immediate practical application in the production of weather to order on a very limited scale was the possibility reported in a technical paper by Dr. Irving Langmuir, Nobel prize winner in 1932. Presented at the annual meeting of the American Association for Advancement of Science in Boston, Mass., in Dec., the paper described experiments in the artificial production of snow and incidental dissolution of clouds by a method based on use of solid carbon dioxide ("dry ice") sprinkled on the clouds from aeroplanes flown above. Under favourable and probably quite limited circumstances the process might be used to dispel clouds over an airport, or to deposit snow for winter sports and water supply, the latter especially in mountain regions where winter snowfall must be utilized for irrigation purposes during the ensuing dry season. The method had not only produced snow and cleared the air locally but also had disclosed certain physical reactions in the precipitation of snow important in meteorological theory and research. It was significant that many meteorologists looked at these possibilities with less skepticism in 1946 than ever before.

Typical of the vigorous attack on the problems of meteorology in general was the research project organized by the U.S. weather bureau late in 1945 and 1946 to develop mathematical methods of meteorological analysis and weather forecasting. The project centred around use of electronic computing devices designed during World War II in somewhat different forms in England and the United States. Under leadership of a selected group of meteorologists, mathematicians and physicists with the financial support of the office of naval research and collaboration of other research organizations the project was inaugurated at the Institute for Advanced Study at Princeton, N.J. This was not the only research directed toward mathematical solution of meteorological problems. There had been much work in this direction in England, the U.S.S.R. and other institutions in the United States, notably at the Massachusetts Institute of Technology, Cambridge, Mass., with the support of the army air forces, but the principal difficulties still remained. No device or technique had been developed to compute with exactness the complex physical interactions in the atmosphere that go to make up the weather. Besides this general attack on the problems of meteorology, some of the more or less discrete aspects of atmospheric processes were under investigation by the research staffs of several universities, among them the University of Chicago, Chicago, Ill., and the M.I.T., where general circulation patterns and their role in weather prediction were being studied; New York university, New York, N.Y., where vertical motion in the atmosphere and its relation to cyclogenesis were under investigation, also a simplified method for short-range forecasting; and the University of California at Los Angeles, Calif., where research efforts were directed toward analysis of wave motion in the atmosphere and study of radiation, temperature inversions and turbulence as related to

formation and dissipation of low stratus clouds.

In Canada as in the United States the experimental use and further adaptation of radar to detect and track severe storms was continued through 1946 and steps were taken to install apparatus for this purpose in several important localities. Ft. Worth, Texas, and Wichita, Kan., and possibly another place about 300 mi. farther north were among the proposed sites, the three stations to give a line of observations by which to watch the formation and movement of severe thunderstorms and possibly tornadoes, thereby to warn aircraft pilots and others concerned of the approach of such storms. The observations might also enable meteorologists to foresee the concentration of heavy rainfall in valleys where flash floods occur. They believed that radar could be developed as an instrument to observe and perhaps measure a number of meteorological conditions of importance in analysis and weather forecasting.

Another and somewhat different approach to the problems resulting from severe local storms was made in the thunderstorm research project authorized by congress and conducted by the weather bureau largely through the collaboration of the army air forces. It was the most comprehensive field study of thunderstorms ever undertaken. A close network of 56 observing stations was organized in the vicinity of Orlando, Fla., and aeroplanes, gliders and radiosonde balloons equipped with special automatic recorders were flown through the storms at planned intervals to determine conditions at various stages of storm development and at different heights. Control and co-ordination of the piloted aircraft were maintained by radar observations and direct radio communications. Intensive observations were obtained by these methods in about 45 thunderstorms during the summer months, and about 30 of these were selected for detailed analysis which was in progress by the end of 1946. Similar observations and analysis of the more complex thunderstorms of the frontal types that occur in higher latitudes were scheduled for the following summer at an A.A.F. base in Ohio.

In the field of meteorological observations and instruments, therefore, there was some progress also in installation of rawinsonde stations at 30 airport weather bureau offices. These with similar stations at several military bases gave fairly complete coverage of the United States for upper air data from the ground to altitudes of 50,000 or 75,000 ft. for use in air navigation and weather forecasting for all purposes. The feature of the rawinsonde that distinguishes it from the radiosonde used for many years is the provision for measuring winds aloft in cloudy weather when the balloon is obscured from view. The drift of the balloon with the wind is determined by radiogoniometry instead of visually as used in the pilot balloon and theodolite method. The rawinsonde also serves to measure the pressure, temperature and humidity of the atmosphere at different altitudes in the same way as the radiosonde. Another aid to air navigation is the recently developed ceilometer which measures the altitude of bases of clouds. Recording ceilometers were installed at more than 100 airport weather bureau offices during 1946. Greater accuracy in reporting cloud ceilings by use of ceilometers promised immediate results in the move to increase safety in air transportation, part of the general air safety campaign, which Civil Aeronautics authorities vigorously renewed as result of numerous aircraft accidents toward the close of 1946.

In hope of extending their knowledge of the atmosphere and its meteorological machinery, scientists watched closely the results of high rocket experiments by the government. Modified V-2s pushed to altitudes somewhat above 100 mi. into regions of the atmosphere never before reached by man-made machine. But meteorologists needed to develop better recording equipment that could withstand the rigours of rocket flight before they

could expect results of practical value in their work. Another technical advance that meteorologists watched with eager interest was the service trials of facsimile communications. Conclusions were that further development would be necessary before a suitable facsimile method was ready to meet the practical requirements for radio and wire transmission of the daily weather map. Successful facsimile transmission would greatly reduce the duplication incident to routine preparation of weather maps at three or six hour intervals at hundreds of weather stations which now have to make identical manuscript entries and analyses from the collected reports of several hundred observers. Facsimile would distribute the map quickly and enable the meteorologist to give more attention to local forecasting and to practical applications of his weather information. But estimates were that development would take five years or more.

Outstanding in their importance to everyday services, especially for aviation, were the several international conferences called during 1946 for the purpose of adopting standard methods for observing and reporting the weather and standard codes and procedures for international exchange of reports and forecasts. In Feb. an extraordinary conference of the directors of the International Meteorological organization (I.M.O.) convened in London. More than 40 nations participated in reorganizing this world-wide body which had carried on co-operation in meteorology from 1878, except for interruptions of war. In the London conference new technical commissions were organized, interim administrative machinery re-established and plans started for the regular conference of directors to be held in Washington in Sept. 1947, following meetings of the technical commissions in Toronto, Ont., in Aug. British empire meteorologists held a five-day conference in London in March. Other international meetings pertaining to meteorological services were convened by the Provisional International Civil Aeronautics organization (P.I.C.A.O.) with I.M.O. representatives attending, in Dublin, Eire, in March, Paris in April (European regional), Washington, D.C., in Aug. (for Caribbean), in Cairo in Sept. and Oct. (near east regional), London in Sept. (to plan continuation of North Atlantic weather patrol vessels) and in Montreal, Que., in Nov. The International Meteorological committee, interim executive body of the I.M.O., met in Paris in July to authorize certain immediate plans of the technical commissions.

In most countries there was evidence of increased emphasis on applied meteorology. In Britain hourly broadcasts carried the specialized advices of the forecaster direct to aircraft pilots. In the United States special services in addition to the general weather service to the public were given by the weather bureau through its airways and flight advisory weather services, the hurricane warning service, the horticultural frost warning service, the forest fire weather warning service, the climatological service with its machine tabulation unit and 60,000,000 punched card library, the hydrometeorological studies and river and flood forecasting service. International co-operation in meteorology was continued in the training of Latin-American students and in the establishment of an arctic weather station at Thule, Greenland, jointly with Denmark; in plans for rehabilitation of the Philippine weather service and in the temporary maintenance of weather stations at numerous overseas points pending resumption of services by the nations concerned. In the general movement to extend the services of applied meteorology the American Meteorological society carried on a program for development of the private practice of meteorology in individual fields of business and industry beyond the scope of government services. A new group organized the Amateur Weathermen of America to promote an interest in meteorology among the youth of the country and others to whom the science appeals as a hobby or avocation.

The Weather of 1946.—In the so-called temperate zone wherein lie the British Isles and most of Canada and the United States and where weather is the result of a rapid succession of high and low pressure systems, it is common talk and belief that the weather is usually unusual. And in some respects the weather of 1946 was in fact unusual in many parts of the world. Average temperatures for the year continued mostly above normal if preliminary reports were indicative. In the United States the year opened with the northern and western half of the country snow-covered but with temperatures during the first few days above normal everywhere except for a narrow strip bordering the Mississippi valley. The departures were as much as 12° F. above normal in Idaho, Nevada and Utah. Rising temperatures carried the departures to 15° F. above normal in parts of Nebraska and South Dakota in the averages for the first week. In Baltimore, Md., Philadelphia, Pa., and Washington, D.C., 65° F. or slightly higher occurred on Jan. 6 and 7. Although there were occasional cold spells during the month, for example -27° F. in North Dakota on Jan. 15 and in northern New York state on Jan. 20, and a few snowstorms in some sections, the average temperature for Jan. was above normal throughout the country (12° F. above normal in Montana) except for a strip along the Mexican border and a portion of northern California. Rainfall also was above normal, in some places 2.5 times normal, in the Gulf states and Tennessee, but it was mostly below normal in other parts of the United States. In Mississippi total rainfall for the month reached 12 in. in some localities.

Unseasonable tornadoes occurred in Texas, Mississippi and Arkansas on January 4 and 6 causing 38 deaths, more than 600 injured and property losses estimated to be in excess of \$6,000,000. Floods occurred in the rivers of Georgia, Kentucky and Tennessee, with heavy damage to property; also in Iowa, Minnesota and Wisconsin where all previous records for winter flooding in these states were broken.

In Feb. the weather was closer to typical winter conditions although monthly averages of temperature again ranged up to 10° F. above normal. Unusually heavy snowfall, in some places more than 2 ft. in depth, was reported not only in New Jersey and New England but also across the Atlantic in southern England and northern France. Traffic was interrupted and in some places much damage caused by accumulations of ice on trees and telephone wires. Over most of the United States east of the Rockies unseasonably warm weather continued through March. Record high temperatures were reported in many places with thermometers showing 85° F. in Boston, Mass., and other eastern localities, 90° F. in Kansas and 100° F. in southern Texas during the last few days of the month. In South Dakota the average was 20° above normal for the last week of March. Peach trees bloomed in the Ohio valley in mid-March and the season was generally two or three weeks earlier than usual. Ice in the Great Lakes melted and opened the season for navigation before the usual dates. Lake Erie opened March 21 and other lakes April 1 except Superior, which opened April 16.

In the British Isles April, for the fourth successive year, was considerably above the average in temperature with new all-time high records

TORNADO which hit southern Michigan, including Detroit and adjacent sections of Canada, on June 17, 1946, causing deaths and property damage

reported in some places for the first part of the month. It was exceptionally sunny and warm in daytime but cool at night. An unprecedented monthly range was established, 80° F. to 25° F., the highest at Greenwich on April 4, the lowest at Farnborough on April 11. Aberdeen ranged from 72° F. on April 2 to 38° F. on April 5. In most of Canada and the United States also, April was abnormally warm. The maxima above normal were reported in a belt about 100 mi. wide extending from the Texas panhandle northward, the maximum departure isopleth being

about 8° F. above normal. High temperatures near 100° F. occurred in southwestern United States and near 95° F. in northern California. In contrast temperatures went below freezing the last week in April in the upper Mississippi valley. In parts of the valley unusually heavy rain was recorded, the heaviest at Seminole, Okla., with 12.1 in. in 12 hours. Many sections had 3 to 4 in. within 24 hours. As a result rivers rose to flood stages in Arkansas, Kansas, Oklahoma and Missouri. Flood and local storm damage including losses from tornadoes and thunderstorms was estimated to be in excess of \$5,000,000, an impressive though not unusual total for April.

*Tables I, II and III are illustrative of variations in temperature, rainfall and sunshine in the United States during 1946 and not the absolute extremes. Other places not listed in the tables may have had larger ranges in these weather elements.

†Column headed "Annual dep." shows the departure from normal in the yearly figure. The normal is the average value of the element over a long period of years. In the table of temperatures the second line under each city shows the monthly normals for convenience in comparing with the average monthly figure for the year 1946.

In the British Isles, excepting southeastern England, the month of May was relatively dry and sunny although 3° to 5° below the average temperature. In North America, likewise, May was somewhat cooler than usual, 4° F. cooler in Nebraska, Kansas and Missouri, except in the far western states and in a narrow strip along the Gulf and Atlantic coasts. Between May 8 and May 13 new records for low temperatures at that time of year were recorded in parts of the north central states. The 32° F. isotherm was carried southward almost to Texas. Duluth, Minn., had freezing temperatures and continuous snow with 50 m.p.h. winds on May 31. In most of the country it was unseasonably wet as well as cool and many field crops were retarded. A serious flood occurred in Pennsylvania, especially in tributaries of the Susquehanna where many previous high records were exceeded two to four ft. In the United States hail storms and tornadoes are numerous during spring and summer, and more than 110 such storms occurred in May 1946 causing at least 15 deaths and destroying property valued at \$10,000,000.

June weather was less unusual. In the British Isles it was typically wet and cool with many gray days. In the United States monthly temperatures were less than 2° F. above the average excepting a small part of New Mexico where it was 4° F. warmer than average. Precipitation also was closer to the average figures than usual except for small areas in Wyoming, the Great Lakes states and Alabama, where rainfall was about twice the average quantity, and a large area in the southwest where there was even less rain than usual, many stations reporting none whatever during the month. Severe local storms again were numerous. More than 125 were reported, most of them thunderstorms with wind squalls and hail. There were ten tornadoes. Total damage by severe storms was estimated at more than \$8,000,000.

Typical summer weather is more variable locally than winter weather. Generalizations about summer weather are often misleading. Although the year as a whole was the warmest since 1871 in Washington, D.C., residents recall July and Aug. 1946 as two of the most pleasant summer months ever experienced there. Some referred to it as a "California summer" and the comparison was not wholly inept. But agriculturalists in nearby Maryland, New Jersey and parts of New England remember it as the worst season in history for several vegetable crops, because the cool damp weather along the coast was conducive to blight. In contrast it was very hot in Iowa, Montana and other western states with temperatures up to 105° F. and even higher

areas were covered by the eastern half of an anticyclone, a condition somewhat analogous to that usually found in southern California in summer with bright sunny days and cool nights and with the winds from a northerly direction bringing relatively dry air in place of hot and humid southerly winds with the sultry weather typical of the eastern states in summer. To the senses the weather was more comfortable than the meteorological statistics suggest. In July average temperatures for the month were about 1° F. higher than usual but dew points and relative humidity were mostly subnormal and there were fewer days with maxima above 90° F. Sensible temperatures were therefore relatively low. In Aug. anticyclones brought cold air from the Canadian arctic and temperatures averaged 2° F. to 6° F. below normal in the Great Lakes area and most of the east and southeast throughout the month. For the summer months as a whole the temperatures averaged 2° F. to 4° F. below normal in the north central, eastern and southeastern states. But in the far western states there were complaints of high temperatures near 100° F. and in Kansas, Missouri and Nebraska thunderstorms gave heavy rains amounting to 7 in. in 24 hours in some places and produced flash floods in the tributaries of the Missouri river, but damage from flash flooding was not as extensive as in several years past. In Australia the continued dry weather aggravated the disastrous results of the record-breaking drought of 1944-45.

The mild summer weather of Aug. in most of eastern United States continued until the second half of Sept., when conditions were reversed for a week, the east getting temperatures averaging from normal up to 12° above and the west 3° to 6° below normal for a week, bringing freezing weather and snow in parts of the mountain states, but in the last week of Sept. hot weather with maxima up to 100° returned to the interior valleys of California and the south and southwest portions of the great basin. The heaviest rains during the month occurred in the Carolinas on Sept. 19 and 20, associated with a hurricane. This was one of the relatively weak tropical cyclones that touched the United States during 1946. A second hurricane crossed Georgia and the Carolinas the second week in Oct. bringing heavy rainfall but only fresh winds and little damage. Another hurricane moved across Florida on Nov. 1 and 2 causing heavy rains in the south Atlantic states and flood waters in the Okeechobee section, but compared with the typical hurricane season the tropical storms of 1946 were both few and relatively weak. The records of severe local storms show that 65 were reported from various parts of the United States during Aug., 34 with heavy hail and 4 tornadoes. There were 13 deaths resulting directly from these severe storms and total property losses estimated about \$4,000,000. In Sept. 35 severe local storms were reported. They caused property damage estimated at \$2,000,000.

In England the long unbroken period of unsettled and disagreeable weather from June through Sept. led to comparisons with similar conditions in previous outstanding years but the records show that 1879 was both wetter and cooler in the vicinity of London than 1946. The summer weather in both years was well characterized as "boisterous, chilly and wet" throughout the British Isles, and 1946 brought phenomenally long periods of unsettled weather in southern England beginning in May. With Oct. came improvement, although not for long. The first few days of bright weather were followed by unusually dry conditions most of the month but cloudy and cool on the whole, and Nov. saw the return of wet and stormy weather. Several localities in England reported new high records of rainfall for Nov. and in many places the total for the month was twice the long time average. Toward the end of the year strong gales came to the English channel and contiguous sections. They caused heavy damage to shipping along the English and French coasts, especially in the port of Le Havre.

In the eastern half of Canada and the United States Oct. and Nov. brought a long period of good weather. Whereas the summer had been relatively cool, the autumn turned unusually warm and gave the year on the whole a remarkably equable climate in these regions that commonly see highly variable weather. Oct. averaged 3° to 6° above normal temperatures in the eastern half of the United States and as much as 3° below normal in the western half. Precipitation was comparatively heavy in the semiarid parts of Nevada and Utah where rainfall was four times the average and in sections of the Carolinas where it was twice the average amount. In the east Nov. continued mild and pleasant with temperatures for the autumn averaging 4° higher than normal and in some places 6°, and the weather remained good most of the time right up to the last few days of Dec., when snowstorms, low clouds and icing brought air transportation holiday traffic practically to a stop. Over the western half of the United States Nov. temperatures in most places were below normal (4° below normal in Montana). In southern California a disturbance with tropical history gave more than 5 in. of rain in 24

hours on Nov. 13 and 14 and caused seasonably dry river beds to fill and overflow their banks. In Colorado the heaviest snowfall in 33 years resulted from slow-moving storms on Nov. 3 and 4 and again on Nov. 8 and 9. With an average depth of two or three ft. and drifts ten ft. deep in some of the streets of Denver, traffic was paralyzed and many persons marooned.

The first widespread cold wave of the season in central and southern United States carried freezing temperatures as far south as central Texas for a brief period the first of Dec., but the air soon turned warm and average temperatures for the second week were above seasonal expectancy throughout the country except along the boundary of Georgia and Florida. In parts of Iowa and Missouri it was 21° warmer than normal. But a new cold air mass out of the Canadian arctic moved southward and overspread the central states in mid-Dec. It carried zero temperatures to the northern plains states and pushed the freezing isotherm almost to the Gulf of Mexico on Dec. 20. Nevertheless weather for the week ending Dec. 24 was warmer than average (9° warmer in Nebraska) throughout the country except for a belt along the Gulf coast and Allegheny mountains. Here it ranged from normal to 3° below normal. Another cold wave engulfed the plains states in freezing weather by the end of Dec. and carried freezing weather south to the Rio Grande. In Missouri thermometers fell from the middle 70°s on the afternoon of Dec. 27 to several degrees below zero on the morning of Dec. 30.

Accompanying the snowfall and bad weather which halted air traffic in New England and the east on Dec. 28 there was a remarkable temperature contrast between Virginia and southern New England. With Washington, D.C., enjoying tropical air at 75° F. that afternoon, New England temperatures were close to 0°, giving a temperature gradient of about 70° F. in a distance of only 300 mi. As the year closed another snow and sleet storm gripped northern Texas, Oklahoma, Missouri, Kentucky, Tennessee and Virginia and caused icing at flying levels. Air travel was interrupted and ice deposits on power and telephone lines caused failures in these services. But despite these cold weather manifestations temperatures for the United States during Dec. again averaged above normal. It was 6° warmer than usual over most of the country and 8° in Colorado, New Mexico and Wyoming. (See also DISASTERS; FLOODS AND FLOOD CONTROL.)

Methodist Church.

This church was in the midst of the four-year program of its "Crusade for Christ," which was launched by the general conference of 1944. The first-year objective, the raising of \$25,000,000 for relief, rehabilitation and advance was highly successful. The

amount pledged was \$27,777,673, and up to Dec. 13, 1946, the receipts were \$26,839,696. Goals for 1946 were evangelism and church school (alias Sunday school) enrolment. Prior to Oct. 15 the year's accessions to Methodist churches¹ numbered 910,447. At the same time the church schools reported a gain of 401,712, thus sharply reversing the declines of the previous decade. The number of churches newly organized or rehabilitated was 728.

In 1946 the benevolent work of the Methodist Church was maintained by gifts of more than \$15,000,000, of which \$4,295,963 was raised and expended by the Woman's Division of Christian Service. The gross amount raised by the churches "for themselves" and "for others" was \$148,286,227, not including the large unreported giving of individual church members. The Committee on Overseas Relief, of which Bishop Herbert Welch was the head, reported 1946 receipts of \$1,800,000, of which one-half came from the Crusade fund. This was disbursed in cash or material—food and clothing—to the needy of 24 countries in the war-spent areas. Of this total three-fifths went to Methodist work and the remainder, about \$750,000, was distributed through numerous non-Methodist agencies, such as the Y.M.C.A., Y.W.C.A., International Missionary Council, American Friends' Service committee, World Council Service, United Jewish Appeal, etc. Gifts for relief during 1946 exceeded the total amount contributed for this purpose in the four years previous.

The Board of Publication reported the largest turnover in its history of more than 150 years. Sales in the fiscal year ending July 1, 1946, were \$8,850,000. After large expenditures for new and refreshed equipment, \$400,000 was appropriated for distribution among the retired ministers. Some 5,500,000 copies of church school periodicals were circulated, and the circulation of the weekly denominational organ, *The Christian Advocate*, rose to 345,000, the highest in its long history. The quarterly *Religion in Life* doubled its circulation, and books for the general trade with the "Abingdon-Cokesbury" imprint had become leaders in the field of religious literature.

Bishop Ivan Lee Holt, as head of the western section of the Oecumenical commission, visited England in the summer for conference with members of the eastern section with regard to renewing the sessions of the Oecumenical conference, which were interrupted by World War II. The seventh session, scheduled for Oxford in 1941, had to be given up. The American committee was authorized by the general conference in 1944 to invite the Methodists of the world to meet in the U.S. in 1947. This invitation was accepted, and plans were being perfected for a session probably in a New England city in the early autumn of 1947.

The latest available statistics showed total membership 8,083,787. Returns from Asia and Europe were fragmentary. Church and parsonage property was valued at \$801,250,933, against which the indebtedness was \$19,025,291. In 1946 the Methodist Church had 40,698 preaching places; 21,270 pastoral charges; 18,288 effective ministers and 5,487 retired. Local preachers numbered 10,539. The church school enrolment was 4,848,748. The membership of the Woman's Society of Christian Service was 1,589,581.

At the annual meeting of the Board of Missions and Church Extension in December, the watchword was "Advance." Appropriations: Foreign missions, \$3,371,393; home missions and church extension, \$2,010,475; Woman's Division of Christian Service \$3,999,451. The division received a cheque for \$500,000 from the estate of E. S. Collins, lumberman, of Portland,

Ore., to be added to the Collins Fund for Missionary Pensions, which had a principal of \$1,884,344.

In Columbus, O., July 4-7, 15 bishops met with 500 delegated Methodist veterans for a conference on postwar problems.

Bishop F. H. Otto Melle of Berlin, was retired for age, and Dean J. W. Ernst Sommer of the Frankfort Theological seminary was elected to succeed him by the Germany central conference. The Philippine Islands central conference elected Dionisio D. Alejandro to take over the Manila area from Missionary Bishop Edwin F. Lee, whose jurisdiction was thereafter limited to Malaya, with residence at Singapore, S.S. Bishop Wade was relieved of superintendence of northern Europe, where the central conference elected Dr. Theodor Arvidson as bishop. Bishop Titus Lowe was president of the Council of Bishops. Bishop G. Bromley Oxnam of New York city, continued as secretary of the council. (See also CHURCH MEMBERSHIP.)

Mexico. A federal republic of North America lying between the United States and Central America. Area, 767,168 sq.mi.; pop. (est. 1945) 21,672,733 (19,473,741 census 1940). Approximately 55% of the population was mestizo, 29% Indian, 15% white, with foreigners and others making up less than 1%. The language is Spanish, but an estimated 14% speak only Indian tongues. There is no official state religion, but the people are overwhelmingly Roman Catholic. The capital is Mexico City (pop. 1,464,556). Other principal cities are: Guadalajara, 228,049; Monterrey, 180,942; Puebla, 137,324; Mérida, 98,334; León, 86,089; Tampico, 81,334; Aguascalientes, 81,124; San Luis Potosí, 78,042; Torreón, 76,613; Veracruz, 70,958; Chihuahua, 57,456; Pachuca, 52,387. Presidents in 1946 were Gen. Manuel Avila Camacho (took office Dec. 1940) and Miguel Alemán (took office Dec. 1946).

History.—For Mexico the year 1946 brought elections, inflation and the international problems of an uneasy, postwar world. The elections caused some violence and considerable excitement; inflation resulted in industrial and social unrest and the international picture showed a tendency to disintegrate the American republics' bloc among the United Nations.

As usual, the election year in Mexico was a time of great popular stimulation because of the speeches, radio broadcasts, press articles and even popular songs. The campaigns were as colourful as each candidate could contrive. However, it soon became evident that the government-sponsored candidate, Miguel Alemán, would have little difficulty at the polls. The principal opponent of Alemán was Ezequiel Padilla, former foreign minister of Mexico. Padilla, after obtaining world-wide recognition as a leader in foreign affairs, fell into eclipse largely through his too friendly attitude toward the United States and his tendency to antagonize the soviet union as well as because of certain local political reasons. In the contest Padilla drew his support from the more conservative elements.

Lesser candidates, all representing the more conservative groups, included Lic. Octavio Véjar Vazquez, Gen. Miguel Henriquez Guzmán and Gen. Enrique Calderón. Many other candidates, including Enrique de Montalvo, failed to qualify, either through lack of sufficient official registration in their parties or through other legal technicalities. The most powerful element failing to qualify was the clerical Sinarquista party, called Partido de Acción Nacional. Also, the Communists decided to withdraw from the presidential contest and concentrated on legislative seats and local government posts.

The first major outbreak of violence, and the largest, occurred on Jan. 2, 1946. Elections for mayor of the town of León,

¹ This article summarizes the activities of the new church which was formed in 1939 by the union of three Methodist sects—the Methodist Episcopal Church, the Methodist Episcopal Church, South and the Methodist Protestant Church. It does not cover the activities of the numerous smaller bodies of Methodists, viz.—African Methodist Episcopal Church, African Methodist Episcopal Zion church, Coloured Methodist Episcopal Church, Wesleyan Methodist Church, Free Methodist Church, Primitive Methodist Church, etc.

Guanajuato, were held in December, at which time the candidate of the León Civic union, Carlos Obregón, won by a wide majority over the candidate of the government party Partido Revolucionario Mexicano (P.R.M.), Ignacio Guiróz. Most of the support for Obregón had come from the Sinarquistas for whom León had been a stronghold. In spite of the elections, however, the state governor installed the official candidate and sent federal troops into León to maintain order. Meanwhile the Sinarquista press freely predicted trouble. A protest meeting was held outside the town on the first of January, only to be dispersed by the police. On the next afternoon a crowd gathered at the city hall and clashed with the federal troops, with the result that an estimated 40 persons were killed in what became known as the León massacre. The president, Avila Camacho, ordered an immediate investigation, and many observers felt that the government party (P.R.M.) might lose much of its popular support. As a result of the investigation, the governor was ousted and the responsible army chiefs were placed on inactive duty, while at the same time Obregón was seated as mayor.

In the middle of January the P.R.M. was dissolved at its own national convention and Antonio Villalobos gave over the chairmanship. A new party, the Partido Revolucionario Institucional (P.R.I.), was formed at the convention under the chairmanship of Pascacio Gamboa, former governor of Chiapas. The key men in the P.R.M., however, took over similar posts in the P.R.I. and pledged their support to the official presidential candidate, Miguel Alemán. Although little of the shakeup, mild though it was, was attributed to the León affair, still the general need for election reforms was recognized and became one of the keynotes of the new party. Even the long-established custom of deducting party contributions from government workers' pay checks was discontinued.

As a result of the stand of the P.R.I. and the popular clamour, the subsequent elections were considered to be perhaps the cleanest ever held in Mexico. Even so, many cases of tampering with ballot boxes and other irregularities were uncovered. On the whole, the campaign was a triumphant procession for the

popular government candidate, Alemán. An extensive speaking tour was held throughout Mexico and a general round of fiestas and celebration resulted.

Ezequiel Padilla was not so fortunate. Although he had been a great success before diplomatic audiences and at conventions, he had great difficulty arousing interest among the average Mexicans. His audiences were sparse and cool.

At the time of the voting in July, every care was taken by the government to avoid disturbances. All sales of liquor were halted two days before election. All polling places were patrolled by the army to see that no force or coercion was attempted. The actual casting of ballots was done very quietly and orderly.

As soon as returns began to come in, it became evident that Alemán was leading his nearest competitor, Ezequiel Padilla, by a margin of about 3 to 1. While this was largely expected, the margin was nevertheless a surprisingly large one. Pres. Avila Camacho announced that he would support the recorded vote.

Alemán was inaugurated without incident on Dec. 1, 1946, in a ceremony which made him the 58th president. He pledged himself to continue the principles of the revolution (stemming from the overthrow of Porfirio Diaz and the aristocracy in 1910) and to promote liberty and democracy. The following cabinet was also announced by the new president: secretary of the interior (Alemán's former post), Héctor Pérez Martínez; secretary of foreign affairs, Jaime Torres Bodet (formerly secretary of education); secretary of treasury and public credit, Ramón Beteta; secretary of education, Manuel Gual Vidal; secretary of agriculture and development, Nazario Ortiz Garza; secretary of national defense, Gilberto R. Limón; secretary of navy, not named—Vice-Adm. Luis Schauffelberg Alatorre acting; secretary of communications and public works, Agustín García López; secretary of commerce, Antonio Ruiz Galindo; secretary of labour, Andrés Serra Rojas; secretary of public welfare, Rafael Pascasio Gamboa; secretary of water resources, Adolfo Orive de Alba, and attorney general, Francisco González de la Vega.

Inflation during 1946 became an increasingly serious problem. Government controls were relatively ineffectual largely, according to most observers, because of the heavy dependence of Mexico on the world markets. Cost of living rose on an average

BULL RING in Mexico City, seating about 47,000 people and said to be the world's largest, was opened on Feb. 5, 1946. It is the first unit of a giant sports centre in the city

(based upon a factor of 100 for 1939) from 265 points in Dec. 1945 to 326.4 in Dec. 1946, or approximately 25%. This rise, while showing tendencies to level off and even to drop slightly, was causing distress among many parts of the population. Clothing had especially skyrocketed (356 to 489.3) and food costs had followed closely (280 to 324.3).

On the other side of the picture, Mexico continued what was, perhaps, one of its most rapid periods of development from colonial days. During the first half of 1946, 230 new industrial units were registered with the treasury department, and of these 43 represented new industrial fields. Advances were especially rapid in steel, glass, pulp and bottling enterprises. Irrigation, after receiving a healthy impetus under former Pres. Lázaro Cárdenas, made even more rapid strides under Avila Camacho, with 1946 representing one of the greatest periods of expenditures in this regard.

The building boom in Mexico continued despite forecasts that it would begin to slump and despite an almost throttling inflation. It was estimated that after prewar days the cost of land for building purposes had risen 700% to 1,100% and that materials had risen 250%. The need for building is better understood when it is noted that according to the 1940 census, more than one-third of the population were living in temporary huts, brush shelters, etc., and that the larger cities such as Mexico City, Monterrey and Guadalajara had doubled or tripled their population in ten years. Mexico City showed the greatest increase, rising from a little more than 500,000 to almost 2,000,000 population. During the latter part of 1946 construction began to lag a little, but there was no reason to believe that the building boom would come to an end in the near future.

It was announced early in the year that an additional \$20,000,000 of credit had been obtained at low interest rate from the Export-Import Bank of Washington, D.C., for the erection of electric generating plants. Of actual government obligation, however, Mexico was remarkably free. Avila Camacho announced that the last outstanding indebtedness, which was owed to the expropriated oil companies, would be paid off before he relinquished office.

In international affairs Mexico was returning after the end of World War II to its traditional position of avoiding too close identification with the United States and continuing to support the more liberal elements in world affairs. The position Henry Wallace took in regard to the U.S.S.R. raised a furor because of the implication that Latin America was a sphere of influence for the United States. This along with Pres. Truman's proposal of a military alliance caused considerable anti-U.S. feeling. Nevertheless, Mexico did set aside the anniversary of the death of Pres. Roosevelt as a national holiday and day of mourning in Mexico, and relations between the two countries were generally cordial and healthy.

A strong campaign against the Franco government in Spain developed under the leadership of the labour chief Vicente Lombardo Toledano, who announced a continent-wide boycott of the caudillo. As a result, longshoremen of Latin America and other labouring groups caused numerous incidents by refusing to handle Spanish cargoes.

Another stand against world fascism was taken by Lombardo Toledano in April, when the International Labour office met in Mexico City (previous meetings had been in Paris and Philadelphia). There the Latin American Labour confederation (C.T.A.L.) of which Lombardo Toledano was president objected to the inclusion of the Argentine delegates on the grounds that they did not represent Argentine labour, but rather Juan D. Perón. Other Latin-American delegates backed that position, and the Argentine delegates were barred from all but the plenary session. During the same meeting, Lombardo Toledano ac-

cused the United States A.F. of L. of trying to break up the C.T.A.L. in favour of a new group to be manipulated from Washington. Delegates from 11 of the Latin-American countries signed the charge for publication.

Of perhaps as great importance as any of the accomplishments of his regime as reviewed by the outgoing president, Avila Camacho, was the campaign against illiteracy. It was estimated that a total of 1,500,000 illiterates had been taught to read and write during 1945 and 1946, and the campaign was still in full swing. By employing the principle, backed by federal law, that each literate much teach one illiterate to read and write, the spectacular accomplishment was brought about with a total cost of less than \$500,000. The foreign minister and poet, Torr  s Bodet, fathered the plan when he was secretary of education.

On the less pleasant side of the year's events was the continued religious strife in Mexico. The Protestant movement, while not large, was vigorous, and considerable resentment among certain Catholic elements developed. Federal protection had to be given to the Protestants, despite which several persons were killed and others injured. The archbishop of Mexico, Luis Mar  a Mart  nez, who had originally asked for resistance to the "invasion," called on all Catholics to abstain from violence because of the new turn of events.

Education.—Education was free, compulsory and divorced from religion. Private schools were allowed, however, to teach religion. There were approximately 25,000 primary schools, with more than 2,000,000 enrolment (the federal government had, in 1946, 32,778 teachers and 1,837,490 students). Secondary schools had about 80,000 enrolment (47,332 enrolment in 522 government schools in 1946 including technical and agriculture). Also, the 10 universities had about 30,000 enrolment, of which 22,230 (1945) attended the autonomous University of Mexico, Mexico City. Six normal schools had 3,800 students in 1946. Illiteracy was about 35%; however, this number decreased about one-fifth under the impact of the new program of "each person teach one person to read," and as a result of special instruction given to all personnel who were illiterate.

Finance.—The monetary unit was the peso (value in Dec. 1946, 20.64 cents, U.S.). By Aug. 1946 money circulation, including bank deposits, had risen to a total of \$852,947,800, of which \$350,962,560 was in paper money, \$105,532,320 in coin and \$396,453,120 in the form of deposits.

The national income for 1945 was \$2,474,323,200, which compared with \$2,288,976,000 in 1944 and was probably greater in 1946. A comparative statement of earnings in 1945 with 1944 by major categories is (1944 figure in parenthesis): agriculture \$250,569,600 (\$230,136,000); grazing \$128,380,800 (\$115,171,200); fishing \$16,512,000 (\$14,448,000); forestry \$28,483,200 (\$26,832,000); mining \$194,016,000 (\$196,080,000); petroleum \$28,070,400 (\$25,180,800); manufacturing \$623,328,000 (\$577,920,000); commerce and finance \$592,368,000 (\$537,052,800); rentals \$154,800,000 (\$138,288,000); transportation \$112,478,000 (\$97,246,400); government service and public works \$175,440,000 (\$173,995,200); it should be noted that the total federal budget for 1945 was \$207,377,625; domestic service \$82,560,000 (\$79,434,000); entertainment, professional service and other \$85,243,200 (\$76,161,000).

Trade and Communications.—During 1945 and the first half of 1946 imports exceeded exports, continuing the trend begun in the latter part of 1944. Both imports and exports were approximately 50% greater during the first half of 1946 than during a comparable period in 1945. The usual division of trade had been: United States 87%, Latin America 5% and Europe 3.9% (most of which went to Great Britain).

Exports in 1945 equalled \$275,234,400, \$278,506,550 in 1944. Gold, silver, copper, lead, zinc, oil and other mining products

comprised some of the largest single items of export. Beef, henequen, tomatoes, chicle, bananas, coffee, chick peas, guayule rubber, cotton, tuna fish, vanilla, vegetable wax and fodder stood high on the export list. Values according to certain general classes during 1944 were: animal products \$14,303,950; vegetable products \$79,027,550; mineral products \$61,046,800; fuels \$6,814,500; textiles \$25,998,350; food and beverages \$20,711,950; other products \$11,944,400.

Imports in 1945 were \$330,941,760 (\$216,370,700 in 1944). Manufactures including machinery and processed items comprised the largest portion of the imports, also wheat, sugar, wool and rice. Values according to certain general classes during 1944 were: animal products \$35,187,600; vegetable products \$63,622,650; mineral products \$48,155,800; textiles \$13,154,050; chemicals \$28,084,000; machinery and iron goods \$40,990,250; scientific apparatus and vehicles \$24,325,700 (automobiles in 1945 were \$12,053,760).

External communications were by sea, especially through Veracruz, by three main railways to the United States and one to Guatemala, by air to all parts of the hemisphere and by a growing network of motor highways.

Total freight carried by railroads in 1945 was 26,124,510 tons. This was an increase from the 1944 figure. Total passengers carried in 1945 were 39,000,000. Railroad mileage was about 15,000 mi. in 1945. There were more than 36,000 mi. of improved roads, of which 5,000 were paved and 7,000 were traversable in all types of weather.

Agriculture.—Mexico had an estimated 37,050,000 ac. of tillable land, of which 13,410,556 ac. were under cultivation according to the 1940 census. More than 17,000,000 ac. were under cultivation in 1945. Forest land comprised 25,893,993 ac.; grazing land 69,713,715 ac.; 2,471,000 ac. were estimated to be under irrigation by the end of 1945 (more than 2,000,000 ac. of this was under cultivation). Latest estimates on the amount of land which could be irrigated if all potential waters were employed equalled about 12,000,000 ac.

Agricultural production was (in tons): maize 2,843,160 (1946); wheat 424,270 (1945); sugar 411,046 (1946); rice 145,464 (1945); beans 201,666 (1945); large kidney beans 18,594 (1943); tomatoes 190,000 (1943); chick peas 82,056 (1943); sesame 96,072 (1943); pineapple 71,700 (1944); coffee 54,000 (1943); henequen 660,236 (bales 1944); chicle 11,590 (1945-46); alfalfa 2,060,500 (1943); green peppers 34,629 (1943); potatoes 135,770 (1943); sweet potatoes 65,806 (1943); cotton 514,800 (bales 1946); vanilla 164 (1943); avocados 60,104 (1943); cacao 1,650 (1943); bananas 7,200,000 (bunches 1943).

Animal census (1940) by head was: cattle 11,621,879; horses 2,511,175; mules 932,522; donkeys 2,341,539; sheep 4,401,014; goats 6,849,709; hogs 5,067,642. An estimated 164,000,000 ac. were devoted to range.

Timber produced in 1942 was: 33,315,000 cu.ft. of pine; 1,317,250 cu.ft. of mahogany; 1,045,320 cu.ft. of red cedar; 432,600 cu.ft. of white cedar; 91,820 cu.ft. of primavera. Charcoal, resins and other products equalled 50,265 tons.

Manufacturing.—During 1946 there was a steady expansion in Mexican industry. For the period Jan.-June 1946, 230 industrial enterprises registered with the treasury department representing almost \$5,000,000 capital, and of these 43 concerns represented new industries. Newer industrial developments included the establishment of rayon factories (additional annual capacity 17,000,000 lb.), tire factories, medical supplies manufacturers, cement factory, hardware and locks manufacturers and a fruit-packing plant. Other important classes of manufacturing firms were: sugar mills, textile mills, alcohol distilleries, cigar and cigarette (917,000,000 packs) factories, shoe, binder twine and soap factories, chemical works, breweries, flour, paper and coffee

mills, iron and steel mills (steel production was up 25% during 1945), cement manufacturers (688,969 tons in 1944), ice plants, glass and ceramic works, and woodworking shops.

Mineral Production.—Although the relative importance of mining to Mexico's economy had decreased, it was still of basic importance in 1946. Total value of metals, not including petroleum, during 1945 was \$156,565,131 (\$146,408,500 in 1944). Precious metals amounted to \$48,067,989 (\$50,786,610 in 1944); however, the higher total value was a reflection of higher prices, for actual production of most items was much lower in 1945 than in 1946—the exceptions were copper, zinc, iron and graphite. Production of various metals during 1945 was: gold 499,300 oz. troy; silver 61,419,197 oz. troy; copper 67,989 tons; lead 226,318 tons; zinc 231,317 tons; antimony 9,649 tons; arsenic 16,548 tons; bismuth 178 tons; cadmium 1,160 tons; coal 1,008,180 tons; tin 195 tons; graphite 26,052 tons; iron 229,441 tons; manganese 20,438 tons; mercury 625 tons; molybdenum 861 tons; tungsten 71 tons; silicon 200 tons.

Petroleum production, after declining from 43,304,179 bbl. of crude in 1941 to 32,955,000 bbl. in 1942, gave promise of reaching a new high in 1946. Estimates for 1946 were for 55,700,000 bbl. of crude and 52,800,000 bbl. of refinery products.

During the first 7 months of 1946, 26 wells were drilled of which 15 were producers. The daily capacity of the new wells was 24,488 bbl. and 1,400,000 cu.ft. of gas. This was a rise in drilling rate over previous years. However, foreign sales were proving more difficult because of the competition from sources previously diverted to military uses.

Meyer, Eugene (1875—), U.S. publisher, banker and government official, was born Oct. 31, in Los Angeles, Calif. A graduate of the University of California (1895), he studied finance and languages in Europe. He entered the banking field, organized and headed the firm of Eugene Meyer, Jr., and company.

In 1917 he joined the government service as adviser on non-ferrous metals to the Advisory commission of the Council of National Defense; later, he held this position with the War Industries board. In the succeeding years, he was director and managing director of the War Finance corporation during the Wilson, Harding and Coolidge administrations; member of the Federal Farm Loan board and farm loan commissioner (1927-29); governor of the Federal Reserve bank (1930-33) and first chairman of the board of the Reconstruction Finance corporation (1932). In 1933 he bought the *Washington Post*, which, under his direction became one of the more prosperous and influential dailies in the east.

On June 4, 1946, Meyer was appointed first president of the International Bank for Reconstruction and Development by the institution's executive directors. He resigned Dec. 4, 1946, declaring that he had accepted the post with the understanding that he would remain only until the bank was launched.

Mica. **United States.**—Statistics on mica production and consumption in the United States during World War II, and the salient figures on the industry are as given in the table on p. 500.

These data reflect clearly the drop in demand that became manifest in 1944 for the strategic form of mica and resulted in relaxations in control measures. They also emphasize strongly the lack of ability to meet more than a small fraction of the

Data of Mica Industry in the U.S., 1940-45

emergency demand from domestic output, even at sharp increases in price. The war price schedule was abandoned Aug. 30, 1945.

During the war years India supplied most of the U.S. imports of splittings and the largest share of the sheet mica, with smaller amounts from Brazil, Canada, Argentina and Madagascar. With the drop in war demand, Brazil took the lead in sheet mica, but India continued to supply most of the splittings.

Canada.—While mica production in Canada was reported to have increased from 3,342 short tons in 1944 to 3,685 tons in 1945, these figures included large amounts of scrap mica. Strategic grades amounted to less than one-quarter of the total.

(G. A. Ro.)

Michigan.

One of the north central group of states, Michigan was the 26th state admitted to the union; it is popularly known as the "Wolverine State." Land area 58,216 sq.mi. (excluding 39,960 sq.mi. of Great Lakes water surface); pop. (1940 5,256,106; estimate, Jan. 1, 1947, 6,150,000). Of the state's population in 1940, 3,454,867 were urban, 1,801,239 rural. Whites composed 95.9% of the population, nonwhites 4.1% (215,934). Capital, Lansing (78,753). Larger cities were Detroit (1,623,452), Grand Rapids (164,292), Flint (151,543), Saginaw (82,794).

History.—The problem of the successful reconversion of industry to peacetime production continued to be a dominant one in Michigan throughout 1946. The General Motors strike which had begun on Nov. 21, 1945, was not ended until March 13, 1946; the 113-day cessation of production by the many thousands of labourers in Detroit, Flint, Pontiac, Lansing, Grand Rapids and other cities naturally affected vitally other industries, the consumption of goods and ultimately state sales tax receipts. Automobile production, nevertheless, though halted from time to time, made progress, and the automotive golden jubilee, celebrated during the summer in conjunction with the commemoration of the 150th anniversary of the American occupation of Detroit, found production considerably advanced toward prewar records.

The legislature, in extra session from Feb. 4 to Feb. 22, enacted 30 laws, most of them of considerable importance. A \$50,000,000 trust fund was created to aid Michigan veterans and their dependents. Appropriations amounting to many millions of dollars were made to the various educational, mental, welfare and corrective institutions supported by the state. For the first time Wayne university, hitherto supported by the city of Detroit, received a grant (\$2,700,000 for a new classroom and science building) from the state. The sum of \$750,000 was appropriated for the development of state parks. Local units of government were authorized to undertake the development and administration of temporary housing for veterans, while county road commissions were empowered to purchase federal surplus airports and equipment.

The grand jury investigation begun in 1944, concerned with alleged graft and corruption in the state government, was inter-

KIM SIGLER, elected Republican governor of Michigan Nov. 5, 1946

rupted in March by the dismissal of Kim Sigler as special prosecutor—an event which was destined to have important political repercussions before the close of the year. The investigation continued, however, and on July 20 nineteen prominent men were indicted on charges of conspiring to block passage in 1941 of an anti-branch bank bill. The star witness against them, Charles F. Hemans, after fleeing the state on Aug. 25, was brought back, tried and sentenced to four years' imprisonment as a federal fugitive witness.

Sometime earlier, Frank D. McKay, former Republican national committeeman, was acquitted on charges of corrupting the state Liquor Control commission.

In a four-way contest in the primary election on June 18, Kim Sigler, formerly a Democrat, received approximately 38% of the votes cast for the Republican nomination to the office of governor, having a plurality of 48,000 votes over his nearest rival. In the Republican nominating convention a few weeks later, Sigler presented for nomination to the four administrative offices to be filled, a slate including the name of but one of the incumbents. The other incumbents, all candidates for renomination, were rejected in the triumph of the Sigler slate.

In the Nov. 5 election, Sigler defeated the Democratic nominee, former Governor Murray D. Van Wagoner, by a plurality of more than 350,000 votes—the largest ever accorded a Michigan governor in a nonpresidential year. The entire Republican state ticket was swept into office. Eugene C. Keyes became lieutenant governor; Fred M. Alger, secretary of state; Eugene F. Black, attorney-general; D. Hale Brake was re-elected state treasurer; Murl K. Aten became auditor general. In a nominally nonpartisan race for justice of the state supreme court, Justice Leland W. Carr, endorsed by the Republicans, was re-elected. U.S. Senator Arthur H. Vandenberg, Republican, was re-elected by a plurality of more than 500,000.

Three proposed amendments to the state constitution were ratified by the voters in the Nov. election. A proposal that one-third of the sales tax levy should go to local governments and school districts carried by a 60-40 margin. By a slightly smaller margin the voters granted a veterans' bonus providing for a maximum payment of \$500, based on \$10 monthly for domestic and \$15 monthly for overseas service between Sept. 16, 1940 and June 30, 1946. Nearly 70% of the voters approved of a proposal to permit the state to engage in the development of harbours of refuge, airports, drainage and other internal improvements. Adoption of this amendment permitted the release of \$1,000,000 being held by the state in escrow for airport building. The money was to be matched by federal funds and was part of a \$28,000,000 seven-year state airport development program.

Total state revenues for 1945-46 were \$304,118,039, topping the previous banner year (1944-45) by nearly 18%. Sales and use taxes accounted for about 39% of this total. About 17% of the total came from gasoline and motor vehicle taxes; the

same amount (as required by the constitution) was expended on the highways. Some 27% was spent on education, 20% on public welfare service, 9% on general government, 5% on mental hygiene. Available surplus for restricted purposes on June 30 was \$75,095,609; for general purposes, \$21,532,356. Revenue to the state from federal agencies amounted to \$31,411,306.

Education.—There were 5,823 school districts in the state public school system in 1946, with an average membership of 591,383 pupils and 19,687 teachers in the elementary grades and 348,592 pupils and 12,763 teachers in the secondary grades. The fall enrolment in Michigan's 65 universities, colleges and normal schools reached a peak of 83,000 full-time students.

Social Insurance and Assistance, Public Welfare and Related Programs.—The various state institutions of correction and their populations as of Dec. 1, 1946, were as follows: State Prison of Southern Michigan 5,354; Michigan Reformatory 1,329; Marquette Branch Prison 783; Detroit House of Correction 312; Cassidy Lake Technical School 30. There were 46 wayward minor boys and 35 wayward minor girls in custody.

Expenditures of the state department of correction for the fiscal year 1945-46 were \$5,035,349.

Communication.—The \$27,000,000 road and bridge construction program undertaken by the state highway department in 1946 encountered many difficulties—perhaps the most important among them being shortages of cement and steel. By the end of the year, however, the program was finally well under way. It included initial sections of two intersecting expressways in Detroit, the construction cost of which (probably in excess of \$40,000,000 for these initial sections) was to be shared by the state of Michigan, the federal government, Detroit and Wayne county. During 1946 two of Michigan's tourist information offices which had been closed during the gas rationing period, were reopened. Traffic across the Straits of Mackinac established an all-time record, with some 450,000 vehicles carried by the state ferries; this was about 19% more than in 1941, the previous record year. Due largely to the strain on the highways by wartime traffic, the annual cost of highway maintenance had been extremely heavy—amounting to about \$10,500,000 in late years.

Banking and Finance.—The 344 state banks in Michigan on Sept. 30 had total assets of \$2,444,449,861.51; assets of 3 industrial banks were \$6,616,407.64; those of 8 trust companies, \$40,771,488.71; those of 47 building and loan associations on June 30 were \$100,313,931.04. Total assets of 78 national banks in operation in Michigan on Sept. 30 were \$2,528,057,000.

Agriculture.—The total acreage harvested was 8,371,000. Over-all production was above average in 1946 in spite of a late spring, early fall frosts and an unusually dry summer. High yields from early crops offset lower yields of some late crops. A new production record was set by small grains. The soybean and buckwheat crops were above average, and sugar beets near average. A potato yield of 123 bu. per ac. was harvested, the second highest on record and above any yield after 1924; but total production was below average because of a decrease in acreage planted. Corn, field beans and hay yields suffered from the long summer drought. Despite frost damage in the spring, fruit production was above average, with the peach crop nearly double the ten-year average and the largest on record. The sour cherry crop also set a new record; grapes, however, were below average. Milk production was near 1945's record level. Egg production was higher than in 1945 and near that of the record 1944 season.

Table I.—Leading Agricultural Products of Michigan, 1946 and 1945

Crop	1946 (Est.)	1945
Oats, bu.	71,890,000	64,400,000
Corn, bu.	50,512,000	61,915,000
Winter wheat, bu.	22,896,000	27,648,000
Potatoes, bu.	18,327,000	8,700,000
Peaches, bu.	4,536,000	3,848,000
Apples, bu.	7,875,000	1,250,000
Barley, bu.	5,037,000	3,906,000
Field beans, 100-lb. bags	3,841,000	3,247,000
All tame hay, tons	3,464,000	3,846,000

Manufacturing.—Because of World War II and postwar conditions, statistics on manufacturing were not available beyond 1939. Rapid return to the production of automobiles, despite delays due to strikes and difficulties in obtaining materials, constituted the most significant feature of manufacturing progress in Michigan in 1946. Illustrative of this development is the fact that the Kaiser-Frazer corporation, which had converted the war production plant at Willow Run to automobile manufacture, had, by the end of the year, reached a production record of 300 cars per day.

Mineral Production.—Official figures on mineral production are shown in Table II. Michigan ranked first in the production of salt and was the

Table II.—Mineral Production of Michigan, 1945 and 1944

	1945		1944	
	Quantity	Value	Quantity	Value
Iron ore, tons	11,834,652		13,693,377	\$38,537,000
Copper, lbs.	60,801,716		84,842,000	11,453,670
Salt, tons	4,285,493	\$14,942,443	4,287,758	14,921,719

(L. G. V. V.)

Michigan, University of. The end of World War II brought an unprecedented influx of students, 14,690 in the spring semester of 1946, and 18,848 in the fall. Of the latter, 11,178, or 60% (about 80% of the men), were veterans. In contrast, the highest prewar enrolment was 12,132. By a "doubling up" process in the residence halls, the use of federal housing facilities originally provided for the Willow Run bomber plant, and a search for all available rooms in Ann Arbor homes, the entire group was successfully housed. An increase in the faculty, from 775 to 977, also was necessary, and the teaching schedule was made to include hours not ordinarily utilized for classes. This situation would have been far more embarrassing if the university had not, in the fall of 1946, limited its enrolment to Michigan residents, returning former students, children of alumni and holders of scholarships. The building program progressed during the year. About half of the quarters for married students were completed and occupied, and the residence halls for men and women and the food service building, also financed through a bond issue, were begun. The legislature in 1946 made a building appropriation of \$4,800,000 (including the administration building already planned) and authorized the university to proceed at once with other projects which would increase the program to \$8,000,000. Consequently, construction of a building for the school of business administration and of additions to the chemical laboratory and the east engineering building, as well as the administration building, was begun, though progress was slowed by lack of building materials. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (F. E. R.)

Mikhailovitch, Draja (1893-1946), Yugoslav army officer, was born in Shumadija, a village near Belgrade. He fought in the Balkan War (1912-13) and in World War I, and then attended the higher military academy and the general staff school. After the swift nazi conquest of Yugoslavia in April 1941, Mikhailovitch fled to the mountains where he welded Yugoslav resistance elements into a strong guerrilla army. His initial operations against the axis were successful and he was made minister of war by the Yugoslav government in exile. In early 1943, Mikhailovitch restricted his operations against the axis and his Chetniks clashed frequently with the Yugoslav partisans, a rival organization headed by Marshal Josip Broz (Tito). In the ensuing struggle for political control of Yugoslavia, Tito won Allied support. Tito's subsequent charges that Mikhailovitch had "sold out" to the axis were echoed (Feb. 22, 1944) by Winston Churchill (then prime minister of Great Britain) who said that Mikhailovitch had "drifted gradually into a position where some of his commanders made accommodations with Italian and German troops." Under British pressure, King Peter himself was forced to disavow Mikhailovitch and announce (May 20, 1944) his removal as minister of war. After the war, Mikhailovitch went into hiding, but was captured on March 13, 1946, and held for trial on charges of treason and collaboration with the axis. A U.S. request (disclosed on April 2) that U.S. army air force personnel be permitted to testify in Mikhailovitch's behalf was rejected.

by the Yugoslav government. During the trial, which opened on June 10 in Belgrade, Mikhailovitch admitted some prosecution charges that he personally collaborated with the enemy, but later retracted this admission, saying that he had been too exhausted by the severe grilling to know what he was saying. After a lengthy trial, he was found guilty (July 15) and together with eight other Yugoslavs was executed in Belgrade by a firing squad, on July 17.

Mikolajczyk, Stanislaw (1901—), Polish politician, was born in Gelsenkirchen, Germany, the son of a farm labourer who emigrated from western Poland to work in the Westphalian mines. He was wounded during the Russo-Polish War in 1920. After the war, he entered politics and at the age of 29 was elected to the sejm, serving from 1930 to 1935. He was made president of the Polish Peasant party in 1937. When the nazis invaded Poland in Sept. 1939, Mikolajczyk saw military action in the unsuccessful defense of Warsaw. He fled to Hungary and later escaped to France. He became President Paderewski's deputy in the Polish parliament in exile, and succeeded to the presidency on Paderewski's death. Mikolajczyk became prime minister in 1943. He sought a settlement with the soviet union on the Polish boundary dispute, but his efforts were hamstrung by anti-soviet elements within his cabinet, and he resigned Nov. 24, 1944. Mikolajczyk endorsed (April 15, 1945) the Big Three decision on Poland which was reached at Yalta, and joined the new Warsaw government as deputy premier, June 23, 1945.

Throughout 1946, Mikolajczyk was violently opposed to what he termed the lack of democracy in the government, and as the campaigning for the 1947 elections got underway, he protested frequently that the government was using terrorist methods to intimidate his followers. After the national elections, Jan. 19, 1947, he disclosed that he had sent detailed memoranda to the U.S., British and soviet ambassadors listing the Polish government's alleged violations of the Potsdam pledges for "free and unfettered" elections.

Military Academy, U.S. A government-maintained college at West Point, N.Y., for the training of young men for leadership in the professional military service. The transition from the accelerated three-year course to the four-year curriculum was continued in 1946. After the graduation of the class of 1946, the next class was divided in half; one-half to be graduated in June 1947 and the other half in June 1948. Thus, with the class which entered in July 1946, there were once more four classes at the academy.

Important changes were made in the academic organization. The subject of chemistry was transferred to the department of physics, which was redesignated the department of physics and chemistry. An additional permanent professor was authorized for each of the nine departments of instruction already having one permanent professor. The positions of professor of law and professor of ordnance (heretofore filled by the appointment of temporary professors) were made permanent professorships. The position of dean of the academic board was created; the dean, with the rank of brigadier general, to be appointed from among the permanent professors who had served as heads of departments.

Under the new curriculum, a course in the psychology of leadership was introduced. Specialized pilot training was discontinued in favour of basic air corps indoctrination for all cadets. For the first time, joint amphibious manoeuvres with the midshipmen of the Naval academy were held during the summer. In order to prepare army candidates for the West Point entrance examinations, a West Point Preparatory school

was established at Stewart Field, N.Y.

(For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

BIBLIOGRAPHY.—*The Catalogue of Information, U.S. Military Academy, West Point, N.Y.*, obtainable from the Adjutant General, War Department, Washington, D.C., gives complete data on entrance requirements, examinations, courses, etc. (M. D. T.)

Milk. The production of milk in 1946 declined slightly but followed the seasonal cycle of 1945. The 1946 output was estimated by the United States department of agriculture at 119,000,000,000 lb. compared with 123,000,000,000 lb., the all-time record of 1945 and a prewar average of 103,000,000,000 lb.

The lower production in 1946 was because of about 4% fewer cows although the production per cow made a new high record. On Jan. 1, 1946, there were 26,785,000 milk cows on farms compared with 27,674,000 in 1945 which was the record of all time. From March on through the year the production per cow was at a new record level of about 4,850 lb. per cow per year compared with 4,789 lb. produced in 1945 and a prewar average of 4,403 lb. This high production was the result of good pastures, the culling of herds of some of the poorer animals and intensive feeding stimulated by the strong demand for milk. During the first half of the year the consumption of fluid milk continued high but in July the amount used as whole milk declined in comparison with a year earlier. Some further decline in whole milk use followed the advance in retail prices in late summer when subsidies and price controls were removed. Civilian consumption of all milk and milk products was estimated at 813 lb. compared with 799 lb. in 1945 and 801 lb. in prewar 1935-39. Civilians got more dairy products in 1946 because of reduced military needs. Total production of milk per capita was estimated at 825 lb. in 1946 compared with 872 lb. in 1945 and 805 lb. in 1936-40.

Butter production increased in the fall but for the year as a whole was the lowest from 1902 allowing civilians only about 10 lb. per capita. Total production was estimated at 1,200,000,000 lb. compared with a prewar average of 2,190,000,000 lb., 1935-39. Lower consumption of whole milk and cream as prices advanced in the fall released more cream for butter production. Cheese production was also smaller in 1946 than in 1945 but above the prewar average. Production of cheese advanced in the late fall months.

Ice cream production expanded rapidly in 1946 and was about 65% above 1945 and 80% above the average, 1940-44.

Prices of milk in the east and far west areas advanced at once following the lapse of price control July 1, 1946. Dairy production payments ceased, which in the second half of 1945 were equivalent to 18% of the price received for milk and 30% of the price of butterfat. The farm price of whole milk averaged \$3.39 per 100 lb. in June plus 50 cents per 100 lb. production payment. In August the price was \$4.11, October \$4.97 and in December \$5.15. Butterfat advanced from 52 cents per pound in June to 90 cents in October and 87 cents in December. Consumers hesitated to pay the higher prices and began to reduce consumption of milk and cream as meats and fats were decontrolled. Organized revolts against paying the high price of butter resulted in a decline in early fall. When other edible fats and oils were decontrolled in October the price of butter dropped nearly 10 cents per pound. The price of milk fluctuated less than prices of butter, cream and cheese. By the end of 1946 milk prices and those of its products had regained their normal relationship. The larger supply of meat for civilians was also a stabilizing factor.

Milk consumption was expected to decline somewhat from the high record of the war years, but the rate was expected to continue above the 340 lb. of prewar. Domestic consumption

of all dairy products was steadily increasing up to World War II. The export outlet was not expected to increase. Evaporated and dry milk production in 1946 was much less than in 1945 but above the average of 1936-40. Stocks of these products were at high levels at the end of the year. Milk production was increasing in Great Britain, Europe, Australia and New Zealand. (See also BUTTER; CHEESE; DAIRYING.)

Mineral and Metal Production and Prices.

The production record of the war years still contains many gaps, some of which will probably never be filled. Information that was withheld by censorship for security reasons was largely released, though delays were caused by lack of help. In some countries in the active war zones conditions became so disorganized that it likely became difficult, if not impossible to collect and compile production data, and probably in some instances data already collected was destroyed. The extent to which the record had already been completed was gratifying, and it was hoped that still more might be accomplished. Almost immediately after the cessation of hostilities, representatives of various U.S. government agencies were sent to the enemy and occupied countries to collect information along statistical and technical lines, and it was because of their efforts that much of the desired information was secured so promptly.

The statistical data that were still lacking on Jan. 1, 1947, were chiefly from the smaller European countries in the active war zone, and from a few others where the difficulty seemed

to be a matter of delay in compiling and reporting. Inspection of the various world production tables that accompanied most of the reviews of the mineral commodities showed relatively few figures missing from major producers, except in instances like the U.S.S.R. and Japan, both of which followed a policy of restricting information of this kind. While the results were less complete for the minor producers, they usually contributed such a small proportion of the total that a fairly good idea could be had of the world picture, in spite of these gaps.

Table I abstracts the opening and closing prices of the leading metals and their ores, as quoted on the New York and London markets. During the war years most of these commodities were under price control, and the year-end figures for 1946 show the decided upturn in prices since the dropping of price control. All controls have been removed from these prices in the United States, and most of them have been removed in Great Britain; official maximum prices were still in effect on aluminum, copper, lead and zinc, but on all of these items the prices have been adjusted to conform to postwar conditions.

Table II presents the available data on mineral production in 1945 for the more important producers and the leading products. While there are still gaps in this information, the table is the most complete that it was possible to produce after 1939. In order to give fuller information, where current figures are lacking, the figure for the preceding year, or the latest figure available is substituted.

Table III shows the gradual expansion of the total value of the mineral production of the United States, as reported by the U.S. bureau of mines. The 1945 valuation dropped to slightly above the 1943 figure, with all of the decline in the metallics.

Table III.—Value of Mineral Products of the United States

Year	(Millions of dollars)			Total
	Metallics	Fuels	Nonmetallics	
1938	892.6	2,820.3	650.3	4,363.2
1939	1,291.7	2,834.3	788.2	4,914.2
1940	1,678.6	3,116.5	812.8	5,613.9
1941	2,132.0	3,708.1	1,037.9	6,878.0
1942	2,363.9	4,103.4	1,109.0	7,576.3
1943	2,488.0	4,608.3	974.7	8,071.0
1944	2,340.0	5,178.0	901.0	8,419.0
1945	1,975.0	5,212.0	956.0	8,143.0

Increased petroleum production offset the drop in coal, and the postwar boom in building construction is reflected in the rise in value for nonmetallics. While there were some decreases in output in 1946, their effect on the valuation was expected to be reduced by the rise in prices under way during the latter half of the year. The *E. & M. J. Metal and Mineral Markets* weighted index of nonferrous metal prices, for example, after standing unchanged at 96.42 from Nov. 1945 through May 1946, rose to 107.16 in June and 117.11 in July, when the price control bill expired. The temporary renewal of control cut the index back to 113.32 in August and September, but in the last quarter it rose sharply, closing the year at 142.19, an increase of nearly half. (See also STRATEGIC MINERAL SUPPLIES and the reviews of the various metals and minerals.) (G. A. Ro.)

Mineralogy.

The papers presented at the Third Symposium on Diamonds, held in Boston Dec. 27, 1945, and published in the *American Mineralogist*, vol. 31, pp. 135-167, constituted major contributions in mineralogy. The list is as follows: "Diamond Production," by S. H. Ball; "Gem Diamonds," by Lazare Kaplan; "Bonded Diamond Wheel Applications," by A. A. Klein and C. R. Van Riper; "Vector Hardness in Diamond Tools," by Harry Whittaker and C. B. Slawson; "Observations on Orientation and Hardness Variations," by Horace Winchell; "The Preparation and Standardization of Diamond Powders," by Herbert Insley and B. L. Steierman; "Application of the High Voltage Arc to the Cutting, Sawing and Drilling of Diamonds," by C. G. Peters; "Controlled Electrolytic Drilling of Diamonds," by C. G. Peters; "Controlled Electrolytic Drilling of Diamond," by W. B. Emerson; and "Developments and Trends in the Use of Industrial Diamonds," by C. B. Slawson.

Reports concerning the discovery of the big, new Mwadui diamond mine in Tanganyika were confirmed by the department of lands and mines, South Africa. It is eight times larger than the famous Premier diamond mine near Pretoria. There were about 6,000 employees during 1946, mostly Africans, and 800 tons of diamond-bearing rock were treated daily. It was expected that 2,000 tons of rock would soon be handled.

New minerals were described as follows: tinctite, a hydrated iron phosphate from the Tintic Mining district, Utah, by Bronson Stringham (*American Mineralogist*, vol. 31, pp. 395-400); montbrayite, a gold telluride from Montbray township, Abitibi county, Quebec, by M. A. Peacock and R. M. Thompson (*ibid.*, vol. 31, pp. 515-526); pennantite, a manganiferous chlorite from the Benallt Mine, Rhiw, Carnarvonshire, Wales, by W. C. Smith, F. A. Bannister and M. H. Hey (*Mineralogical Magazine*, vol. XXVII, pp. 217-220). In his address, "Geological Mineralogy," K. K. Landes, as retiring president of the Mineralogical Society of America, urged that more attention be paid by mineralogists to paragenesis, that is, to the occurrence of minerals in the field (*American Mineralogist*, vol. 31, pp. 131-134).

The unprecedented demand for jewel bearings during World War II for use in meters, scientific instruments of all kinds, watches and so forth necessitated the development of industries for the manufacture of synthetic rubies and sapphires in the United States, Great Britain and Russia. Prior to the war, these

jewel bearings were produced in Switzerland, France and Germany, but that supply was cut off. Three informative and well-illustrated articles appeared in 1946: "Genuine and Synthetic Rubies and Sapphires," by A. E. Alexander (*Journal of Chemical Education*, vol. 23, pp. 418-422 and 459); "Man Makes Gems," by H. P. Rooksby (*Journal of Gemology*, May and June, pp. 288-291 and 355-356); "Synthetic Sapphire Production in U.S.A." (*Industrial Diamond Review*, vol. 6, pp. 80-82).

Revised Lapidary Handbook, by J. H. Howard (Greenfield, S.C.), is an enlargement of the author's *Handbook for the Amateur Lapidary*, published ten years before. The various phases of gem cutting are discussed in detail.

As the published results of researches in all phases of crystallography as related to physics, chemistry, mineralogy, metallurgy and biology are widely scattered in many journals, the organization of an International Crystallographic union was discussed in London during the summer of 1946 by leaders in modern crystallography. It was agreed to issue a journal to be called *Acta Crystallographica*, and Professor P. P. Ewald, of the University of Belfast, was selected as editor.

At the 1946 meeting of the Mineralogical Society of America, held in Chicago, Dec. 27, C. S. Ross, of the U.S. geological survey, was awarded the sixth Washington A. Roebling medal for meritorious achievement in mineralogy. (See also MINERAL and METAL PRODUCTION AND PRICES.) (E. H. Kr.)

Mining: see MINERAL AND METAL PRODUCTION AND PRICES. See also under separate minerals.

Minnesota.

A north central state of the United States, popularly known as the "Gopher state." Area, 84,068 sq.mi., of which 4,059 are water. Pop. (1940) 2,792,300. The urban population was 49.8% of the total. Capital, St. Paul (287,736). Other principal cities, Minneapolis (492,370); Duluth (101,065). The native born white inhabitants in 1940 numbered 2,474,078, foreign-born, 294,904 and Negro, 9,928. The bureau of the census estimated the civilian population of the state at 2,558,085 on July 1, 1943; 2,494,945 on July 1, 1944, and 2,484,993 on July 1, 1945. More than 320,000 Minnesota men and women were in military service during World War II. More than 262,000 had returned to civilian life by Dec. 31, 1946.

History.—Principal elective officials of the state in 1946 were: governor, Edward J. Thye; secretary of state, Mike Holm; treasurer, Julius A. Schmahl; auditor, Stafford King; attorney general, J. A. A. Burnquist. In Nov. 1946, Luther W. Youngdahl was elected governor for 1947-48; Edward J. Thye was elected U.S. senator.

The 54th session of the legislature met in regular biennial session in 1945. No special sessions were held during the interim. The 55th session convened on Jan. 7, 1947.

Education.—Contribution of the state to local schools, including income from trust funds and fixed income tax allotments, was expected to amount to \$49,103,549 for the biennium that began July 1, 1945. Total public school expenditures for the 1945-46 school year were \$67,201,568, compared with \$61,960,004 in the 1944-45 school year. In 1945-46, Minnesota had 8,196 elementary schools, 645 secondary schools, 6 public state teachers colleges and 11 junior colleges. Enrolment was 326,017, with 11,910 teachers in elementary grades; 162,524, with 7,776 teachers in the secondary grades; 1,726, with 118 teachers in junior colleges; 9,522, with 82 teachers in adult education classes; and 289, with 27 teachers in teacher training departments. Dean M. Schweickhard was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—The aid to dependent children average grant per case rose 6.8% from Nov. 1945 to Nov. 1946, while old-age

assistance and aid to the blind average grants per recipient case rose 7.8% and 8.1%, respectively, during the same period. During the year ending June 30, 1946, \$1,902,514 was spent on general relief, with the number of cases averaging 5,154; on old-age assistance, \$21,063,964, with the number of recipients averaging 54,291. A total of \$2,969,375 was spent on aid to dependent children, with the number of families aided averaging 4,778 and number of children helped averaging 12,132. An average of 946 persons shared in the total allowance of \$439,611 in aid to the blind. The state prison, two state reformatories and two training schools for delinquents had 2,181 inmates on June 30, 1946.

Communication.—Minnesota had, at the end of 1945, 11,237 mi. of state trunk highways and 102,004 mi. of other highways, excluding city streets. Expenditures of the state highway department for construction, maintenance and administration during the year ended June 30, 1946, were \$14,794,000 as compared with \$12,524,000 for the year ending June 30, 1945. The state highway building program, with federal aid, was expected to make possible \$74,000,000 in construction in the first three postwar years. Railway mileage at the end of 1945 was 9,080 mi. There were 45 licensed municipal airports. There were 7 seaplane bases, 65 privately owned public airports and 90 privately owned landing strips for private use.

Banking and Finance.—Resources of Minnesota banks reached a level on July 1, 1946, approximately 24% higher than the total on July 1, 1945. The 490 state banks, one mutual savings bank and four trust companies had deposits of \$846,012,000 and resources of \$898,844,000 compared with deposits of \$675,887,000 and resources of \$722,994,000 on July 1, 1945. The 181 national banks had deposits of \$1,960,700,000 and resources of \$2,083,326,000 on July 1, 1946, compared with deposits of \$1,869,395,000 and resources of \$1,980,701,000 on July 1, 1945. The state had 41 state building and loan associations on July 1, 1946, with resources of \$62,014,000 as compared with resources of \$50,930,000 on July 1, 1945. The 30 federal savings and loan associations had resources of \$152,767,000 on July 1, 1946, compared with resources of \$122,219,000 on July 1, 1945. Total operating disbursements of the state government (excluding public debt redemption, stores for resale, annuities and pensions, and land and interest in land) amounted to \$116,901,122 for the year ended June 30, 1946, as compared with \$105,662,555 for the year ended June 30, 1945. Outstanding state bonds and certificates of indebtedness were reduced \$8,476,298 during 1946 to a net of \$63,937,943, making a \$65,849,717 reduction in eight years. Four principal trust funds of the state, income of which is devoted largely to schools, reached \$152,611,122 on Dec. 31, 1946.

Agriculture.—Based on volume of production in 1946, Minnesota ranked third in corn; second in oats; first in flaxseed, alsike and sweet clover seed; fourth in spring wheat, barley, rye, all hay and timothy seed; sixth in soy beans; seventh in

LUTHER W. YOUNGDAHL, Republican, was elected governor of Minnesota Nov. 5, 1946

red clover seed; eighth in alfalfa seed and tenth in potatoes. Peak output in butter production was reached in 1941 when more than 326,000,000 pounds were manufactured in the state, and in 1945 production was 233,000,000 pounds. The downward trend in the first nine months of 1946 was checked and the trend turned upward compared with the previous year. For the calendar year 1945 cash receipts from farm marketings totalled \$858,647,000 with \$667,229,000 from livestock and livestock products and \$191,418,000 from crops.

*Leading Agricultural Products of Minnesota,
1946 and 1945*

Crop	1946	1945
Corn, all, bu.	239,888,000	216,299,000
Oats, bu.	192,168,000	242,640,000
Barley, bu.	21,257,000	12,963,000
Wheat, all, bu.	27,080,000	21,246,000
Potatoes, bu.	16,610,000	19,140,000
Flaxseed, bu.	9,303,000	11,737,000
Hay, all, tons	5,897,000	6,564,000

Manufacturing.—The 1939 U.S. census of manufactures listed 4,008 manufacturing establishments employing 92,084 persons. The *Guide Book to Minnesota Industry* published by the Minnesota Resources commission in 1946 included 5,850 manufacturing establishments. The number of employees in manufacturing industries in Nov. 1946 was estimated at 199,669, 11.7% higher than in Nov. 1945.

Mineral Production.—With more than 65% of U.S. production, an estimated 49,750,000 gross tons of iron ore was shipped from Minnesota mines in 1946 as compared with 62,830,000 gross tons in 1945. (R. B. J.)

Minnesota, University of. An institution of higher education at Minneapolis, Minn. Enrolment of regular collegiate students, which started upward in the fall quarter of 1944, continued the accelerated increase reported in 1945, and in the fall quarter of 1946 reached a figure of 27,103—two and one-fourth times that of the previous fall. By the fall of 1946 the percentage of women students had dropped precipitously from the 70% reported in 1944 and the 63% in 1945 to a new low of 27.4%. Veterans enrolled at the beginning of the fall quarter, 1946, totalled 16,428, 15 times the 1,096 enrolled a year before. Of this year's total, 680 were women. The college of science, literature and the arts, among the colleges of the university, enrolled the largest total, 9,751; the Institute of Technology was second with 5,313. A national educational conference featuring addresses by eminent leaders in American life was held April 23–25, 1946 in celebration of the inauguration of Dr. J. L. Morrill as eighth president of the university. Three new deanships were created during the year, this rank applying to the heads of the general college, the general extension division, and the office of admissions and records. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (J. L. ML.)

Miquelon: see FRENCH COLONIAL EMPIRE.

Missions, Foreign. The foreign missionary enterprise of the Christian churches continued the recovery which had been begun in 1945. More missionaries returned to their posts and a number of new missionaries were sent. Additional ones were in preparation. In the United States several of the religious bodies were raising large postwar funds for reconstruction and advance, and of these substantial portions were earmarked for foreign missions. In Great Britain giving continued at high levels. Gains in funds, however, were more than offset by the rising costs of conducting missionary

operations and by the enormous amount of rebuilding needed in areas which had suffered from the destruction of war. In Japan the difficulty of obtaining housing and food stood in the way of sending many missionaries. However, a few returned. Moreover, the Japanese, prostrate in defeat, were singularly open-minded to the Christian message. The Protestant churches inaugurated a campaign to add 3,000,000 to their membership. In Korea in the U.S. zone, church activity revived and a few missionaries re-established residence. Little information came from the soviet zone. The Chinese scene was so large and varied that generalizations were difficult. Accurate statistics of loss or growth were not obtainable. Some Catholics declared that their numbers had increased during the war years. Others doubted this growth but believed that the life of their church had been deepened. Protestants had gained in some regions and held that, in general, their churches came out of the war stronger than when they entered it. In some areas, notably in those controlled by the Communists, missionary activity and the work of the churches were hampered or made impossible. Civil strife between the National government and the Communists created uncertainties and here and there impeded the churches and the missionaries. In the Philippines returning missionaries and the Filipino Christians were resuming their labours and were beginning to repair the extensive damage to congregations, schools and properties. A somewhat similar situation existed in Burma. In the East Indies the independence movement retarded the renewal of missions, especially in Java. Indeed, in that island, where Moslems were in the overwhelming majority, the struggle for independence had anti-Christian aspects. In India the movement for independence brought uncertainty as to the future of the churches. There, too, the intense nationalism, reflected as it was in the churches, wrought embarrassment for many missionaries. A Protestant conference in Africa brought African Christians and missionaries together for comprehensive planning.

(K. S. L.)

Mississippi. A southern state of the U.S.A., admitted to the union in 1817, popularly known as the "Magnolia state"; area, 47,716 sq.mi. (47,420 sq.mi. land and 296 sq.mi. water); pop. (1940), 2,183,796; capital, Jackson (62,107). Other cities: Biloxi (17,475); Greenville (20,892); Gulfport (15,195); Hattiesburg (21,026); Laurel (20,598); Meridian (35,481); Natchez (15,296); Vicksburg (24,460). Of the state's population in 1940, 432,882, or 19.8%, were urban. In 1940 there were 1,106,327 whites; 1,074,578 Negroes; 2,177,324 native born; 6,472 foreign born. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 2,175,877.

History.—For 1944-48 the elected officers of the state, chosen in the Democratic primaries in Aug. 1943, and in the general election of that year, were: governor, Thomas L. Bailey; lieutenant governor, Fielding L. Wright; secretary of state, Walker Wood; attorney general, Greek L. Rice; state tax collector, Carl N. Craig; state treasurer, Newton James; state auditor, Bert J. Barnett. The superintendent of education in 1945 was J. M. Tubb. Governor Bailey died Nov. 2, 1946. Lt. Gov. Fielding L. Wright succeeded to the governorship to serve until Jan. 1948. Oscar Wolfe became presiding officer of the state senate until Jan. 1948.

Education.—In 1946 there were 1,071 white elementary schools in Mississippi and 3,348 Negro elementary schools, a total of 4,419. The enrolment in elementary schools was 468,074, of whom 219,214 were whites and 248,860 Negroes. The state had 551 white high schools and 100 Negro high schools, with a total enrolment of 71,176 in 1945-46. There were 8,928 white elementary and high school teachers, and 6,236 Negro

FIELDING L. WRIGHT, Democrat, who succeeded to the governorship of Mississippi upon the death on Nov. 2, 1946, of Governor Thomas L. Bailey

elementary and high school teachers, a total of 15,164 teachers. The total enrolment in white elementary and high schools was 275,900; in Negro elementary and high schools, 263,350.

Social Insurance and Assistance, Public Welfare and Related Programs.—

From July 1, 1945, to June 30, 1946, the state department of public welfare paid \$5,209,078 to 30,787 recipients of old-age assistance; \$407,283 to 1,766 recipients of aid to the blind; and \$974,030 for aid to 4,054 families for 10,756 dependent children.

The department continued its regular program of child welfare services on all types of problems affecting children, particularly those children in rural areas. Special child welfare workers were assigned to ten county departments of public welfare, to the State Industrial and Training school and to the Negro Juvenile reformatory. The department of public welfare continued its service to the new parole board established by the 1944 session of the Mississippi legislature.

Through its division for the blind, the department maintained a program of sight conservation, restoration and services. It continued its program of training blind persons to work on factory-type sewing machines, making cloth bags of all sorts under government contracts. This division was also made the channel for federal funds for vocational rehabilitation of blind civilians.

Communications.—In 1946 the state maintained 6,583.7 mi. of highways. In 1945 the counties maintained approximately 54,000 mi.

In 1946 state maintenance expenditures were estimated at \$2,423,263.25; in 1945, \$2,039,610.75. In 1945 county expenditure for maintenance costs amounted to \$8,602,231.50.

The total mileage of railroads in the state on Dec. 31, 1946, was 3,924.02 mi.

Banking and Finance.—On Sept. 30, 1946, there were 179 state banks in Mississippi, with 22 branch banks and 31 branch offices. There were 24 national banks in Mississippi. The resources of the state banks were \$564,772,116.70 and the total deposits were \$532,102,500.23; the resources of the national banks were \$221,728,979.92 and total deposits were \$210,082,836.93.

The balance in the general fund account as of Jan. 1, 1946, was \$23,156,889.38; on Dec. 31, 1946, it was \$17,371,786.09. The special fund account as of Jan. 1, 1946, was \$8,131,891.17; on Dec. 31, 1946, it was \$20,276,912.75.

On Dec. 31, 1946, the full faith and credit debt of the state of Mississippi was \$16,943,000; outstanding highway bonds amounted to (payable from the gasoline tax) \$48,991,000 making a total state debt of \$65,934,000.

Agriculture.—In 1945 there were 264,704 farms, exclusive of urban farms. In 1944 the census showed that of the total land area 19,634,617 ac. were in farms, land in harvested crops being 6,474,360 ac. In 1945 receipts from farm marketing were \$293,406,000, of which \$210,158,000 were from crops and \$83,-

248,000 from livestock and livestock products; the value of farm products consumed in farm households was \$102,262,000. In 1945 the value of all crops was \$376,256,000.

Table I.—Leading Agricultural Products of Mississippi, 1945 and 1944

Crop	1945	1944
Cotton (500-lb. bales)	1,615,000	1,937,000
Cottonseed, tons	671,000	795,000
Corn, bu.	50,660,000	42,224,000
Oats, bu.	13,671,000	15,096,000
Hay, tons	1,185,000	1,139,000
Sweet potatoes, bu.	6,936,000	6,248,000
Sugar-cane syrup, gal.	3,910,000	3,630,000
Sorghum syrup, gal.	1,680,000	1,950,000
Peanuts, lb.	13,000,000	12,555,000
Pecans, lb.	6,000,000	8,300,000

Manufacturing.—The value of all manufactured products in Mississippi for the year 1945 was \$439,000,000.

The amount of wages paid in 1945 to persons employed in all industries employing 8 or more persons amounted to \$237,000,000 as against the amount of \$234,000,000 for 1944, and \$94,000,000 in 1939.

Mineral Production.—The total value of mineral production in 1944, including natural gas, sand and gravel and other mineral products, was \$18,988,000. In 1944 about 16,337,000 bbl. of petroleum were produced; in 1943, 18,807,000 bbl.

Table II.—Principal Mineral Products of Mississippi, 1944 and 1943

Mineral	Value, 1944	Value, 1943
Natural gas	\$ 314,000	\$385,000
Sand and gravel	877,370	1,098,740
Petroleum	16,800,000	18,430,000
Other mineral products	397,115	564,065

In 1944, 1,200,000,000 cu.ft. of natural gas were produced; in 1943, 1,461,000,000 cu.ft.

On Dec. 31, 1946 there were approximately 740 producing oil wells in the state. (A. B. Bu.)

Missouri. A west north central state of the U.S.A., admitted to the union in 1821; popularly known as the "Show Me" state. Area 69,674 sq.mi. of which 404 are water. Pop. (1940) 3,784,664 (51.8% urban, 48.2% rural); 3,425,062 (90.5%) native white, 114,125 (3%) foreign-born white and 244,386 (6.5%) Negro. On July 1, 1945, the bureau of the census estimated the population of the state at 3,481,949. Capital, Jefferson City (1940 census) (24,268). Largest cities: St. Louis (816,048), Kansas City (399,178), St. Joseph (75,711), Springfield (61,238).

History.—On July 1, 1946, the administrative branch of the state government began to function under a new organizational structure, which was the result of the adoption of a new constitution in 1945. This organizational structure was effected by the provisions of the new constitution, reorganization acts passed by the 63rd general assembly and executive orders issued by the governor.

The 63rd general assembly (Jan. 3, 1945–Dec. 12, 1946) was in session 23 months and 10 days, the longest session on record, although the house met on only 230 legislative days and the senate on 253. Besides passing laws implementing the new constitution, the general assembly enacted legislation providing for the extension of the merit system of personnel administration, an enlarged forestry program, the giving of proof of financial responsibility of certain automobile drivers, decreases in personal income and general property taxes and increases in social security benefits.

In the election on Nov. 5, 1946, the Republicans made substantial gains in Missouri. The popular vote for U.S. senator was James P. Kem (Rep.) 572,556, Frank P. Briggs (Dem., incumbent) 511,544. Nine Republicans and four Democrats were elected to the national house of representatives, a Republican gain of three seats; the Democratic candidate from President Harry S. Truman's home district, who was supported by the

president, was defeated. The Republicans retained control of both houses of the state legislature.

The major state officers (1946), all Democrats, were: Phil M. Donnelly, governor; Walter N. Davis, lieutenant governor; Wilson Bell, secretary of state; Forrest Smith, auditor; Robert W. Winn, treasurer; James E. Taylor, attorney general.

Education.—For the school year ending June 30, 1946, the public school system consisted of 7,721 elementary schools, with 476,792 pupils and 16,803 teachers; 841 secondary schools, with 149,538 pupils and 6,198 teachers; 5 state teachers' colleges, with 7,396 students and 427 teachers; Lincoln university (Negro), University of Missouri, (Rolla) School of Mines and Metallurgy, schools for the deaf and blind and a Negro vocational school. In Nov. 1946, Hubert Wheeler was appointed state commissioner of education in accordance with the new constitution, succeeding Roy Scantlin, state superintendent of education.

Under the G.I. Bill of Rights and the Vocational Rehabilitation Act for Disabled Veterans, 54,424 veterans of World War II were enrolled in schools and colleges and 27,758 were receiving job training in Missouri on Dec. 31, 1946.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ending June 30, 1946, unemployment insurance totalled \$22,498,025, and the government employment services made 139,851 placements. For the same period old-age assistance amounted to \$32,030,620, aid to dependent children \$5,377,414, general relief \$2,271,776 and blind pensions \$1,068,585; the monthly average number of persons receiving old-age assistance was 102,092, aid to dependent children 33,068, general relief 21,238, blind pensions 2,863. During the year ending June 30, 1946, the state penitentiary had an average of 2,540 inmates per day; the reformatory and industrial schools, 960. In the same period expenditures for the penal and correctional institutions amounted to \$2,034,822.

Communications.—On Dec. 31, 1945, Missouri had 16,183 mi. of state highways and 100,629 mi. of rural roads. During 1945 the state highway department spent \$18,600,617 (state and federal funds), of which \$3,360,102 was for construction and \$6,213,868 for maintenance. On Dec. 31, 1944, railroad mileage totalled 6,882 mi. There were 893,470 telephones in use on June 30, 1946.

Banking and Finance.—On June 29, 1946, Missouri had 484 state banks, with deposits of \$2,001,854,000 and resources (loans and investments) of \$1,883,023,000; 81 national banks, with deposits of \$1,221,326,000 and resources (loans and investments) of \$1,254,854,000; 176 building and loan associations, with resources of \$188,081,248.

Total receipts of the state treasury during 1946 amounted to \$156,664,530; disbursements for 1946, \$147,268,242; gross state debt, Jan. 1, 1946, \$63,000,000 and net state debt, Dec. 31, 1946, \$57,000,000.

Agriculture.—During the first ten months of 1945 cash income from crops and livestock was \$576,209,000; during the same period of 1946, \$629,619,000. The value of Missouri's 1945 crops was \$381,290,000, and the value of Missouri's 1946 crops, harvested from 13,475,000 ac., was estimated at \$529,923,000. The crop production in 1946 was the largest in several years, principally because the growing season was the longest on record and the growing conditions were favourable throughout the season.

Table I.—Leading Agricultural Products of Missouri, 1946 and 1945

Crop	1946 (est.)	1945	Value, 1946
Corn, bu.	171,976,000	104,571,000	\$232,168,000
Alf hay, tons	4,214,000	4,504,000	67,124,000
Cotton, bales	305,000	180,000	51,240,000
Oats, bu.	60,884,000	28,709,000	49,925,000
Soybeans (for beans), bu.	14,360,000	9,360,000	38,054,000
Winter wheat, bu.	18,780,000	18,256,000	36,245,000

Manufacturing.—The number of persons employed in the manufacturing industries in Sept. 1945 was 306,600, or 28.8% less than the wartime peak of 430,500 in July 1943. The number of persons thus employed in Aug. 1946 was 332,000, or 8.3% more than in Sept. 1945.

In 1939, when the last U.S. biennial census of manufactures was taken, Missouri's industries manufactured products valued at \$1,388,056,267, employed 178,538 wage earners and 24,275 salaried persons and paid

Table II.—Principal Industries of Missouri, 1939 and 1937

Industry	Value of products	
	1939	1937
Meat packing (wholesale)	\$107,254,213	\$116,576,053
Footwear (except rubber)	100,346,106	103,253,379
Iron and steel (excluding machinery)	89,059,177	77,681,234
Wearing apparel	85,297,177	76,998,667
Malt liquors	41,412,301	34,272,016
Drugs, medicines	23,006,499	24,335,460

\$190,735,851 in wages and \$58,937,137 in salaries.

Mineral Production.—In 1945 the value of Missouri's mineral production was \$74,171,000, slightly more than in 1944, but less than the wartime peak of \$76,122,304 produced in 1942.

Table III.—Principal Mineral Products of Missouri, 1945 and 1944

Mineral	Value, 1945	
	Value, 1945	Value, 1944
Lead	\$30,370,900	\$27,949,280
Coal	10,098,000	12,315,606
Cement	6,134,452	4,881,516
Stone	6,055,747	5,312,384
Zinc	5,100,250	8,350,728
Lime	5,031,222	5,820,028
Clay (raw and products)	3,774,478	3,205,495

Molasses: see SUGAR.

Molotov, Vyacheslav Mikhailovich (1890—), Russian statesman, was educated at Petersburg polytechnic and during his youth organized bolshevik student groups. He was appointed president of the soviet of people's commissars in 1930, was named foreign commissar May 3, 1939, succeeding Maxim Litvinov, and signed the nazi-soviet pact of nonaggression in Moscow, Aug. 24, 1939.

On May 6, 1941, Molotov resigned as premier of the U.S.S.R. and was succeeded in this office by Stalin; he remained as foreign commissar, however, and took over the vice-premiership. Three weeks after the German invasion of Russia, Molotov signed, July 13, the British-U.S.S.R. mutual-aid pact in which each nation agreed not to make a separate peace. He participated in the Stalin-Churchill parleys in Moscow that ended Oct. 18, 1944, attended the Yalta parley (Feb. 4-11, 1945) and headed the soviet delegation at the United Nations conference in San Francisco. The Russian foreign minister then attended the Berlin conference and represented the soviet union at the London Council of Foreign Ministers (Sept.-Oct. 1945). This conference ended in failure but a later meeting of Molotov, Byrnes and Bevin at Moscow in December was more successful and the Big Three reached agreement (Dec. 27, 1945) on a variety of problems.

Molotov represented his country at most of the major international conferences in 1946, and clashed frequently with delegates of the western powers. After the close of the first Paris council of foreign ministers, Molotov asserted (May 27) that the "Anglo-U.S. bloc" had waged an offensive during the conference in an effort to "impose its will" on the soviet union. On July 10, at the council's second session in Paris, he rejected secretary Byrnes' proposal for a four-power treaty to guarantee German disarmament for 25 years as "wholly inadequate." In speaking on Trieste before the Paris peace conference, Molotov warned, Sept. 14, that attempts "to form another bloc directed against peace-loving countries" would end as "the League of Nations did, in another world war."

Much of Molotov's alleged "intransigence" melted in the closing phases of the N.Y. council of foreign ministers and the United Nations sessions, and he made several important concessions to speed up their work. As he left for Moscow on Dec. 14, he expressed satisfaction with the accomplishments of the meetings.

Molybdenum. The following data on the molybdenum industry in the United States were reported.

Metal Content of Molybdenum Concentrates, 1939-46

	(In millions of pounds)						
	1939	1940	1941	1942	1943	1944	1945
Production	30.32	34.31	40.36	56.94	61.67	38.68	30.80
Shipments*	32.42	25.33	38.38	66.44	53.96	39.42	32.52
Consumption	?	?	16.9†	56.39	49.89	31.52	32.70
Stocks	?	?	?	?	20.16	23.31	21.65
Industrial	?	?	21.22	12.54	17.99	19.34	16.90
Metals Reserve	—	—	?	?	2.17	3.97	4.75

*Including exports. †Second half only. ‡First half.

A decline of about one-half in the war demand for molybdenum took place between 1942 and 1945, and with the ending of the war a similar drop began, bringing consumption in the first half of 1946 down to little more than 1,000,000 a month, against 2,640,000 lb. in the third quarter of 1945, 4,150,000 lb. in 1943, and 4,700,000 lb. in 1942. Production was maintained somewhat ahead of consumption, however, and stocks increased. Production in 1946 dropped back to the level of the mid-1930s.

(G. A. Ro.)

Monaco. A principality on the Mediterranean coast, bounded on the land side by French territory. Area: 375 ac. (.6 sq.mi.); pop. (census 1939): 23,975. Chief towns: Monaco, La Condamine, Monte Carlo. Language: French. Ruler: Prince Louis II.

By the beginning of 1946 plans were under way for restoring the tourist industry and the International Sporting club, and seasons of opera and ballet were re-opened at Monte Carlo. On July 24 Prince Louis II was married to Ghislain Dommanges, a naturalized citizen of Monaco. (J. R. A.)

Monazite. With reduced consumption of monazite in the United States and heavy government and industrial stocks, imports from India and Brazil were allowed to drop from 4,980 tons in 1943 to 384 tons in 1944, but rose to 549 tons in 1945. (G. A. Ro.)

Monetary Units: see EXCHANGE CONTROL AND EXCHANGE RATES.

Mongolia (OUTER AND INNER). A vast, arid, sparsely settled tableland in northeastern Asia. The portion next to the Great Wall of China and south of the Gobi desert is known as Inner Mongolia; it is a part of China. Outer Mongolia, north and west of Inner Mongolia, is an independent nation. Area: 956,844 sq.mi. Pop. (estimated) between 6,000,000 and 8,000,000. Mongolia has a short but extremely hot summer season and extremely cold winters of approximately eight months' duration. Lack of water, type of soil and the short growing season make agriculture impossible in the greater part of the area. The chief industry is grazing and the Mongols live a nomadic life, moving wherever water and pasture are available. Religion: Lamaism, a variety of Buddhism. Thirty per cent of the male population live in lamaseries (monasteries).

Outer Mongolia.—Pop. (est. 1941), 900,000. Capital, Ulan Bator (formerly Urga) (100,000). Mongolia declared its independence from China in 1912 at the time of the fall of the Manchu dynasty. Agreements with Russia in 1912 and 1914 made Mongolia, in effect, a Russian protectorate. In 1915 the treaty of Kiachta, signed by representatives of the three countries, recognized limited Chinese suzerainty and local autonomy.

In the treaty negotiated by the U.S.S.R. and China in Aug. 1945 China agreed to recognize the independence of Outer Mongolia if the people of the country indicated that this was in accordance with their wishes. A plebiscite in Oct. 1945, witnessed by a Chinese delegation, resulted in a unanimous vote in

favour of independence. China officially recognized the independence of the Mongolian People's republic on Jan. 5, 1946. In Feb. 1946 the Mongolian People's republic concluded an "amity pact" with China and an "agreement of friendship and mutual assistance" with the U.S.S.R. Outer Mongolia had not exchanged envoys with any foreign nation with the probable exception of the U.S.S.R. In Aug. 1946 a five-man delegation arrived in New York to support the application for membership in the United Nations. The application for membership was voted down by the United States, Great Britain and the Netherlands.

Economic and Social Developments.—Information in regard to Outer Mongolia is limited to soviet sources. Land, natural resources, factories, mines, banks, haymaking stations and public utilities are nationalized. In 1941 there was a total of 27,000,000 head of cattle; there were 163,000 ac. under cultivation. State co-operatives produced goods valued at 64,000,000 tugriks (90 kopeks) in 1941, and in 1940 handicraft co-operatives turned out goods valued at 19,000,000 tugriks. Power plants, automobile repair shops, coal mines and modern print shops were established. In 1944 there were 285 primary schools, 36 secondary schools, 8 technical schools and 190 nomad schools.

Government.—The constitution drafted in 1940 established a government strikingly similar to the soviet system of Russia. The supreme organ of the state is the Great Hural which is elected by the hurals of the provinces and the hural of Ulan Bator. The constitution specifies that it must meet at least once in three years. A second body, known as the Little Hural, is elected by the Great Hural and serves as the supreme organ of government when the former is not in session. The Little Hural chooses a presidium of seven members which functions in its place when it is not in session. The administrative functions are carried on by a council of ministers whose membership consists of the heads of the ten departments of government. Local government is based on a system of hurals of the various geographical subdivisions. All men and women 18 years of age or over have the right to vote.

Inner Mongolia.—Inner Mongolia includes Jehol, Chahar, Suiyuan and Ningsia, provinces along the northern border of China. Large numbers of Chinese migrated to Inner Mongolia where they reside in the cities or on the farms. The Mongols predominate in the grazing areas.

The strategic location of Inner Mongolia led to its occupation by Japan in 1937, allegedly as a move to forestall soviet penetration. Japan organized the area into a new state, Mengjiang. With the surrender of Japan in Aug. 1945, Chinese Communist forces occupied Chahar and Jehol. Kalgan, the capital of Chahar and an important railroad centre, was termed a "second Yenan," many Communist activities being centred there. In Sept. 1946 the Chinese nationalist forces made a drive toward Kalgan. The Communists announced that a continuance of the drive would result in open civil war. The nationalists agreed to a ten-day truce as suggested by the representatives of the United States. Communist spokesmen insisted on an indefinite truce. The result was a new drive on Kalgan and, on Oct. 11, the nationalists announced the capture of the city. At the close of 1946 eastern Inner Mongolia, including Chahar and Jehol, were largely under the control of the Communists although the nationalists had captured a number of important cities in Jehol and the capital of Chahar. Suiyuan and Ningsia, the provinces farthest west, were in nationalist hands.

According to Chinese estimates, the population of Inner Mongolia was more than 7,000,000. Principal products of the area are wool, furs, coal, iron, opium, cereals and linseed.

BIBLIOGRAPHY.—Robert Pollard, *China's Foreign Relations 1917-1931* (1933); Eleanor Lattimore, "Report on Outer Mongolia," *Far Eastern Survey* (Nov. 6, 1946); Owen Lattimore, "The Outer Mongolian Horizon," *Foreign Affairs* (July, 1946). (P. A. V.)

Montana. A northwestern state of the United States, popularly known as the "Treasure state." Land area 146,316 sq.mi.; water area 822 sq.mi.; pop. (1940): 559,456 (1946 est., 547,800); principal cities (1946 pop. est.): Helena (16,700); Butte (37,000); Great Falls (36,000); Billings (26,200); Missoula (21,500); Anaconda (12,100); Bozeman (10,400). Of the total population in 1940, there were 540,468 whites, of whom 484,826 were native-born and 55,642 were foreign-born. The urban population was 211,535 or 37.8%. The Indian population numbered 16,841.

History.—Incumbents in the principal state offices in 1946 were: Sam C. Ford (Rep.), governor; Ernest T. Eaton (Rep.), lieutenant governor; Sam W. Mitchell (Dem.), secretary of state; R. V. Bottomly (Dem.), attorney general; George P. Porter (Rep.), treasurer; John J. Holmes (Dem.), auditor; Elizabeth Ireland (Rep.), superintendent of public instruction. In the 1946 elections the veteran statesman Burton K. Wheeler, seeking a fifth term in the United States senate, was defeated in the primary by former Associate Justice Leif Erickson who in turn lost in the general election to Zales Ecton (Rep.). Mike Mansfield (Dem.) and Wesley D'Ewart (Rep.), were re-elected representatives in congress. Paul T. Smith (Dem.), was elected railroad and public service commissioner, and Frank Murray (Dem.), clerk of the supreme court. Hugh Adair and Lee Metcalf were elected to the supreme court on a non-partisan ticket. Elections for the state legislature returned strong Republican majorities in both houses.

Education.—There were 1,480 elementary schools in Montana in 1946, with an enrolment of 68,137 and a teaching staff of 3,365. There were 187 high schools with 25,389 students and 1,326 teachers. The net amount spent on the operation of these schools was \$15,509,990. In 1946, Governor Ford appointed a commission of nine members to make a statewide study of public elementary and secondary schools whose report, submitted in November, called for sweeping changes in school district organization and financing methods.

Social Insurance and Assistance, Public Welfare and Related Programs.—Approximately 18,000 persons received public assistance in 1946. Grants totalling \$6,109,811 were distributed as follows (figures in parentheses indicate the average number of recipients per month): Old-age assistance (10,675) \$4,294,158; aid to dependent children (5,213) \$960,192; aid to needy blind (357) \$156,492; subsistence (1,125) \$346,747; medical care (287) \$49,399; hospitalization (334) \$274,253; burials (36) \$28,571. Unemployment benefits of \$1,077,800—almost 15 times the amount for 1945—were paid to 11,500 persons, an average of \$13.40 per week for 6.87 weeks, or \$92 per claimant. Correctional institutions with their average populations and total expenditures in 1946 were: Montana State prison, 336 inmates, \$249,206; State Industrial school, 72 inmates, \$77,408; Vocational School for Girls, 63 inmates, \$53,444.

Communications.—In 1946, the state highway commission maintained 8,430 mi. of highways, of which 1,217 mi. were unsurfaced. State highway expenditures in 1946 were \$7,269,045, including federal aid. There were 95 designated airports, of which 26 were suitable for large commercial or military aircraft. The railway mileage was 5,235 mi. The number of telephones was estimated at 89,802.

Banking and Finance.—There were 110 banks in the state in 1946. The 39 national banks had total deposits of \$263,042,000. and their total assets were \$275,192,000. State banks had total deposits of \$234,501,489, and their total assets were \$244,982,138. There were 16 building and loan associations with assets of \$16,924,727. For the fiscal year 1945-46, the net state income was \$35,813,921 and the total expenditures \$29,975,893. The gross debt of the state on July 1, 1946, was \$8,360,000 and the

net debt, \$4,729,432.

Agriculture.—Early season handicaps of dry weather and late freezes were largely overcome by abundant July rains and the total value of crops harvested in Montana in 1946 was approximately \$39,000,000 more than in 1945, and more than double the average value for the ten preceding years. Greater production of most crops and sharply increased prices boosted the farm income to a high peak of \$209,523,000 as compared with \$160,681,000 in 1945, and \$91,807,000 for the 1935-44 average. A \$30,000,000 increase in the main crop, wheat, was responsible for most of the rise in total value.

Table I.—Leading Agricultural Products of Montana, 1946 and 1945

Crop	1946	1945
Wheat, bu.	62,395,000	57,145,000
Hay, tons	2,438,000	2,767,000
Barley, bu.	18,000,000	14,784,000
Sugar beets, tons	916,000	865,000
Oats, bu.	10,509,000	9,367,000
Corn, bu.	2,520,000	2,295,000
Potatoes, bu.	2,080,000	1,650,000
Alfalfa seed, bu.	120,000	120,000
Mustard seed, lb.	38,200,000	25,200,000
Dry beans, 100-lb. bags	322,000	234,000
Flaxseed, bu.	490,000	1,312,000
Seed peas, 100-lb. bags	348,000	360,000

Manufactures.—The total value of manufactures (1939 census) was \$151,885,026. Total employment in 1939 was 10,898, and wages and salaries paid, \$15,832,241. Reports of the unemployment compensation commission of Montana showed that an average of 15,000 persons (wage and salary earners) were employed in manufacturing in 1946 with total wages of about \$35,000,000.

Table II.—Industrial Products in Montana, 1945 and 1944

Products	1945	1944
Cheese, lb.	4,172,438	3,940,502
Butter, lb.	9,899,081	11,807,544
Powdered milk, lb.	47,955	44,000
Ice cream, gal.	1,588,491	1,455,590
Beet sugar, tons	128,000	109,000
Flour, sacks	3,426,383	2,946,559
Mill feed, lb.	132,996,509	110,900,405
Beer, bbl.	265,000	251,912
Gasoline, gal.	159,491,392	171,452,175

Mineral Production.—In spite of a 54% rise in gold production, mainly because of the resumption of dredge operations by a number of companies, the total value of the five principal metals produced in Montana declined 18% from \$35,405,505 in 1945 to \$28,974,160 in 1946. Silver production declined 47% below that of 1945; copper 36%; lead 11% and zinc 9%. Insufficient manpower and labour difficulties were the principal factors responsible for these reductions.

Table III.—Principal Mineral Products of Montana, 1946 and 1945

Mineral	Value, 1946	Value, 1945
Copper	\$18,305,700	\$23,896,620
Zinc	3,918,000	4,002,690
Silver	2,561,360	4,225,472
Gold	2,401,000	1,560,895
Lead	1,787,700	1,719,828
Total value	\$28,974,160	\$35,405,505

Crude oil production amounted to approximately 8,885,000 bbl. in 1946, about 500,000 bbl. more than in 1945. Coal tonnage produced in Montana during 1946 was 3,561,203 tons, as compared with 4,441,174 tons for 1945. (E. E. B.)

Montenegro: see YUGOSLAVIA.

Montgomery, Bernard Law, 1ST VISCOUNT, OF ALAMEIN (1887—), British army officer, was born Nov. 16. He joined the Royal Warwickshire regiment as a second lieutenant in 1908, and fought in France during World War I. A month before the outbreak of World War II, in Aug. 1939, he was appointed to command the third division which went to France with the B.E.F., and helped evacuate his troops from Dunkirk in June 1940. In the summer of 1942, Lt. Gen. Montgomery was made commander of the British 8th army. Under "Monty's" leadership, the 8th army

turned back the Afrika Korps at El Alamein in Oct. 1942, and chased Rommel into Tunisia. On Feb. 11, 1943, Montgomery's forces were placed under Gen. Eisenhower's unified command.

Montgomery, who was promoted to a field marshal supernumerary in 1944, played a major role in the conquest of Tunisia (1943), the invasion of Sicily and Italy (1943), the landings in France (1944) and the final battles in Germany (1944-45). He was appointed chief of the British occupation forces and British member of the Allied Control commission in Germany, May 22, 1945. Elevated to the peerage (Jan. 1, 1946) as Viscount Montgomery of Alamein, he was named chief of the Imperial General staff (April 30, 1946). He visited Washington, D.C., in September, declaring that he was studying U.S. army training methods. Early in Jan. 1947, Montgomery visited Premier Stalin in Moscow.

Montreal. A city in the province of Quebec, Canada, first called Ville Marie, founded in 1642 on the site of the Indian village of Hochelaga, Montreal is on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. Being at the head of ocean navigation, it is the terminus for lake vessels from the Great Lakes and is served by three canal systems—the St. Lawrence canals (1,230 mi. to the Great Lakes), the eastern United States canals, via the Richelieu river and Lake Champlain (length 127 mi.) and the Ottawa river canals (length 119 mi.).

The population of the city proper, as estimated by *Lovell's Directory* (Nov. 1946) was 1,360,638, and of greater Montreal 1,574,666.

The city is governed by a mayor and a council of 99 members, of whom one-third are appointed by public bodies, one-third elected by the property owners and one-third by the citizens generally. The mayor is elected by the citizens. The council appoints from among its members six councillors to act as an executive committee. Greater Montreal is supervised by the Metropolitan commission, on which the city and suburban municipalities are represented.

The port of Montreal is the largest in Canada. Deep-sea-vessel arrivals in 1946 numbered 749, with a net tonnage of 2,819,166. The number of coastal- or inland-vessel arrivals in 1946 was 207, with a net tonnage of 176,025.

The assessed value of real estate, as of April 30, 1946, was \$1,281,313,440, of which \$937,763,173 was taxable and \$343,550,267 was exempt from taxation.

In 1946 building permits were issued for 3,751 new buildings (other than dwellings), having a value of \$42,696,160 and for 2,703 repairs (other than of dwellings), having a value of \$10,487,365. In addition, building permits were issued for 5,587 new dwellings and for 271 repairs of dwellings.

Bank debits for 1946 were \$18,828,185,425 and bank clearings \$11,451,090,860. (J. A. MA.)

Montreal, University of. One of the two great centres of French culture on the American continent. During 1946 an institute of experimental medicine and surgery was created by the faculty of medicine. A school of hygiene offering postgraduate courses for the preparation of public health officers followed. Other initiatives were the launching of two trimestrial bilingual reviews (French and English) entitled *Bulletin de la faculté de médecine de l'université de Montréal* and *Revue de psychologie*. Advanced postgraduate courses to vulgarize modern methods were amplified by the faculty of dental surgery, thanks to a generous appropriation of the Kellogg foundation. To keep in step with the evolution of after-war exigencies, a department of industrial relations in the

faculty of social science and an optical institute for scientific and technical teaching were also created. The faculty of letters was enriched with two promising institutes of history and geography respectively, thus promoting abundant research in these fields.

There were received during the year several much-appreciated minor gifts and an endowment of \$100,000 by Albert Hudon to the faculty of commerce. (O. M.)

Montserrat: see LEEWARD ISLANDS.

Mormons. **Welfare Work.**—Besides furnishing help in food, clothing, heat and shelter to about 38,671 of its needy members in the United States (principally in the Rocky mountain and Pacific coast states), the church was distributing to its needy members resident in the war-stricken countries of Europe in 1946 more than 47 carloads of food and clothing and, in addition, more than 4,500 packages of vitamins. Of the total shipment, 12 cars of clothing (carload lots), which included 679,404 pieces of clothing and 43,262 pairs of shoes, were assigned to Belgium, Czechoslovakia, France, Germany, the Netherlands and Norway and 28 cars of food to the same countries, which included 500,000 cans of vegetables, nearly 250,000 cans of fruits, more than 50,000 cans of meat, more than 130,000 cans of evaporated and dried whole milk, more than 23,000 cans of pork and beans, more than 300,000 lb. of cracked wheat and considerable quantities of jam, honey and sorghum, together with soap (nearly 17,000 bars) and soap powder (168 packages). The great bulk of the material sent was either produced by the Welfare plan operations or were the voluntary contributions of church members. A very small proportion was acquired by purchase from the public stockpiles. The church had begun shipments to its members in Japan.

Buildings.—The building of meeting houses, with recreation halls attached, was carried on as rapidly as materials could be secured. The plans for many other units were approved and funds for their erection were raised and appropriated. Work thereon was to begin at the earliest practicable moment. It was decided to push the building of a temple in Los Angeles during 1947.

Missions.—The European missions were reopened during the year in Switzerland, Czechoslovakia, France, the Netherlands, Belgium, Sweden, Norway and Great Britain; and arrangements were made for beginning work in the occupied European areas as soon as this would be permitted. Plans were also forming for opening a mission in Japan and in China. The missions in the islands of the Pacific, including Australia, New Zealand, Samoa, Tonga, Tahiti and Hawaii, were consolidated under one head. Increased missionary work was planned for the Indians of the United States and among the peoples of Latin America.

Centennial.—July 24, 1947, would mark the 100th anniversary of the arrival of the Mormon pioneers in the Salt Lake valley. Elaborate plans were maturing during 1946 for the celebration of this event in 1947. (See also CHURCH MEMBERSHIP.)

Morocco: see FRENCH COLONIAL EMPIRE; SPANISH COLONIAL EMPIRE.

Morrison, Herbert Stanley (1888–), British statesman and lord president of the council, was born at Brixton, London, on Jan. 3, 1888. After leaving school at 14 he worked at a variety of jobs until 1913, when he took up politics as a full-time occupation, first as a journalist and then as secretary to the London Labour party. He became mayor of Hackney for one year in 1919, and

in 1922 was elected to the London county council, which was the main sphere of his activities and influence for 18 years. Having been a member of parliament during the years 1923–25, 1929–31 and from 1935 onward, and minister of transport in the second Labour government, he became in May 1940 one of the three Labour members of the Churchill coalition government as minister of supply. In Oct. 1940 he became home secretary and minister of home security, and in 1941 he was admitted to the war cabinet. In the Labour government which came into power in 1945 he held a prominent position as leader of the house of commons and lord president of the council. It was in the latter capacity that he visited Washington on May 11, 1946, to discuss with President Truman measures for combating the world food crisis, and while in the U.S. he broadcast a speech on the world food situation; he attended similar discussions in Ottawa and returned to England on May 21. In June he attended the Labour party conference at Bournemouth, where he was among the first to reject the Communist party's application for membership.

Mortgages, Home: see HOUSING.

Moscow. In 1946 the execution of the five-year plan, voted in March, was only in its initial stages, and results in Moscow were not yet spectacular. The largest developments provided by the five-year plan for Moscow concerned the construction of motor vehicles, machine tools, diesel engines, electrical equipment, etc. A further expansion of the textile industry of the Moscow province, which already accounted for 40% of the textile production of the soviet union, was planned. The total industrial production of the Moscow province represented 20% of the country's total in 1946. A 30% increase in the total industrial production of this province was contemplated for 1950. Much less ambitious, under the first postwar five-year plan, were the plans for the expansion of housing in Moscow, only 3,000,000 sq. metres of new living space being provided for, enough to house approximately 300,000 persons, although the 1946 population of Moscow had risen to nearly 7,000,000 from 4,200,000 in 1940. No spectacular town planning for Moscow was provided for under the five-year plan.

In 1946 the important gas main bringing natural gas from Saratov to Moscow was completed and came partially into operation. City transport continued to be extremely crowded and inadequate. Numerous repairs were done to historic buildings including the gilding of the Kremlin domes, but house-building and ordinary house repairs were slow owing to shortage of labour, timber and other building materials.

Agriculture in the Moscow province concentrated, as before, on potato and vegetable growing and dairy farming. Horned cattle numbered 526,000 on Jan. 1, 1946, as against 448,000 on Jan. 1, 1941. Grain crops in 1946 suffered severely from drought, but the potato and vegetable crops were fair. In the early part of the year there was visible progress towards prewar living standards, but, as a result of the bad harvest, rations became both dearer and smaller by autumn.

The centre of soviet diplomatic activity during the year largely shifted from Moscow to Paris and New York, with Vyacheslav Molotov abroad a large part of the year. 1946 saw the first full-fledged May-day parade after prewar days: it lasted for eight hours, with Generalissimo Joseph Stalin present in the Red square.

The most notable Moscow trials were those of former General Andrey Vlasov and other traitors, held *in camera*, and that of the Cossack former general, Ataman Semyonov, and seven other

émigrés convicted as Japanese agents, which was public.

(A. WH.)

Motion Pictures. It was estimated that 1946 box office grosses exceeded even those of 1945, some authorities placing the figure in the vicinity of \$1,750,000,000. Record earnings of film companies were ascribed in large part to repeal of the federal excess profits tax, helped by rising attendance, advances in admission prices and increased receipts from foreign trade.

Expense of production rose all along the line—higher wages, advanced costs of materials, greater prices paid for film rights to books and plays, more extensive use of colour film and lengthened “shooting” schedules for pictures. It was estimated that the prewar average of 40 to 50 days for producing a picture increased to 87 days.

In general, quality rose with costs. Budgets of \$1,000,000 to \$1,500,000 came to be considered average for “A” features, and a number of productions ran into several millions. There was a corresponding movement away from “B” or “filler” pictures.

At the same time, several of the major companies, feeling that a drop in theatre attendance was impending, began retrenchment programs which affected hundreds of technicians and artists. A reduction in the heavy salaries paid the performers, particularly those just below the rank of stardom, was considered inevitable if this economy movement continued and more players were thrown on the open market.

In addition to its domestic troubles, of which factional labour strife was foremost, the industry found it necessary to deal in detail with the complicated and varied aspects of the foreign market situation. With practically all foreign countries imposing some form of restriction upon film imports and dollar exports, the U.S. industry sought world freedom of exhibition.

For the first time, there was the prospect of real competition to U.S. pictures abroad. British production, paced by J. Arthur Rank, was viewed by many U.S. executives as a growing encroachment upon Hollywood pre-eminence in world markets. Rank's motion picture activities continued to ramify. They included an affiliation with U.S. companies such as Universal-International and Eagle-Lion. Spectacles such as *Henry V* and *Caesar and Cleopatra*, produced with Hollywood lavishness in Great Britain, attracted wide U.S. attention when released by Rank through United Artists.

Labour difficulties again troubled the industry. The paper settlement of the controversy between the International Alliance of Theatrical Stage Employees (American Federation of Labor) and the Conference of Studio Unions (predominantly A.F. of L.) in 1945 after an eight-months strike by the C.S.U. did not bring labour peace. Uneasy conditions continued. A 2-day strike by the C.S.U. in July 1946 ended with a 25% pay raise for studio employees generally. In September, the C.S.U. went out in another strike which was still in progress at the year's end.

As in the 1945 strike, production was not halted, but made more burdensome and expensive. The release print situation was adversely affected when the technicians' local of the I.A.T.S.E., in defiance of its international leaders, joined the strike. For a time there was some delay in the manufacture of black and white prints, and release of a number of high-budgeted colour pictures was held up pending ability to obtain prints.

The year was featured by two other instances of internal industry strife. Howard Hughes, producer of *The Outlaw*, became involved with the Motion Picture Association of America in a contest upon which hinged, in the opinion of some observers, the fate of the industry's self-regulation of its product through the Production Code administration. The controversy, centring around Hughes's use of advertising material without

submission to that organization, resulted in the producer taking court action against the M.P.A.A. Meanwhile, *The Outlaw*, which met with a number of local censorship difficulties, scored heavily at box offices in its runs.

David O. Selznick broke with Mary Pickford and Charles Chaplin, his colleagues of United Artists, and his connection with that organization was severed. He announced formation of his own releasing company, Selznick Releasing organization, and late in the year filed suits aggregating \$13,500,000 against Miss Pickford, Chaplin and United Artists.

The long-drawn-out controversy with the U.S. government over industry trade practices continued. The U.S. district court in New York, which in 1945 had heard the government's anti-trust action against eight motion picture companies, announced its findings in June 1946. New methods of distributing pictures were prescribed, but general divorcement of theatre ownership, as asked by the government, was not ordered. At the end of the year the court handed down its final decree, embodying some changes. Appeal by both sides seemed to be in prospect.

The most important structural change of the year was the merger of Universal and International (William Goetz and Leo Spitz), an independent organization, the resultant company becoming Universal-International.

The year was notable for the number of exceptional foreign films shown in the United States. Imported products included *Henry V*, *Brief Encounter*, *Stairway to Heaven*, *The Wicked Lady*, *Caesar and Cleopatra*, and *The Seventh Veil* (British); *The Well-Digger's Daughter* (French); and *Open City* (Italian). *Henry V* was chosen as the best picture of the year by the National Board of Review.

Also at year's end more and bigger Hollywood pictures were in competition for honours from the Academy of Motion Picture Arts and Sciences than ever before. Included among the outstanding films receiving attention were *The Best Years of Our Lives*, *The Yearling*, *The Jolson Story*, *The Razor's Edge*, *Duel in the Sun*, *It's a Wonderful Life*, *The Green Years*, *Till the Clouds Roll By*, *To Each His Own*, *Deception*, *The Dark Mirror*, *Anna and the King of Siam* and *Notorious*.

The annual critics' poll of the *Film Daily* gave the following as the “ten best” pictures of 1946: *The Lost Weekend*, *The Green Years*, *Anna and the King of Siam*, *The Bells of St. Mary's*, *Spellbound*, *Saratoga Trunk*, *Henry V*, *Notorious*, *Leave Her to Heaven* and *Night and Day*.

The New York film critics picked *The Best Years of Our Lives* as the year's best picture, with William Wyler, its director, winning the directorial award. British players won both awards for performances, Laurence Olivier being voted the best actor for *Henry V* and Celia Johnson the best actress for *Brief Encounter*. The foreign picture award went to *Open City*.

The Production Code administration in 1946 approved 397 U.S. feature pictures, as against 359 in 1945. Foreign pictures receiving the P.C.A. seal in 1946 totalled 28 (1945—31).

Important new screen personalities to emerge in 1946 included Burt Lancaster, Robert Mitchum and Claude Jarman, Jr. Among British players to find favour with U.S. audiences during the year were Deborah Kerr, James Mason and Ann Todd.

The 1946 poll of exhibitors by the *Motion Picture Herald* placed Bing Crosby as the top box office star for the third successive year. The ten leading box office stars according to this poll are:

- | | |
|--------------------|----------------------|
| (1) Bing Crosby | (6) Humphrey Bogart |
| (2) Ingrid Bergman | (7) Greer Garson |
| (3) Van Johnson | (8) Margaret O'Brien |
| (4) Gary Cooper | (9) Betty Grable |
| (5) Bob Hope | (10) Roy Rogers |

Academy of Motion Picture Arts and Sciences awards for 1945: Best picture, *The Lost Weekend*, Paramount; performances: actor, Ray Milland in *The Lost Weekend*; actress, Joan Crawford in *Mildred Pierce*,

Warner Bros.; supporting actor, James Dunn in *A Tree Grows in Brooklyn*, 20th Century-Fox; supporting actress, Anne Revere in *National Velvet*, Metro-Goldwyn-Mayer; best direction, Billy Wilder for *The Lost Weekend*; best written screen play, Charles Brackett and Billy Wilder for *The Lost Weekend*; best original screen play, Richard Schweizer, for *Marie-Louise*, Praesens (Swiss); best original motion picture story, Charles G. Booth for *The House on 92nd Street*, 20th Century-Fox; best art direction—black and white—Wiard Ihnen for *Blood on the Sun*, Cagney, United Artists; colour, Hans Dreier and Ernst Fegte for *Frenchman's Creek*, Paramount; best cinematography—black and white—Harry Stradling for *The Picture of Dorian Gray*, Metro-Goldwyn-Mayer; colour, Leon Shamroy for *Leave Her to Heaven*, 20th Century-Fox; best sound recording, Stephen Dunn for *The Bells of St. Mary's*, Rainbow, RKO; short subjects—cartoon, *Quiet, Please*, Metro-Goldwyn-Mayer (Frederick C. Quimby, producer); one-reeler, *Stairway to Light*, Metro-Goldwyn-Mayer (Herbert Moulton, producer; Jerry Bresler, executive producer); two-reeler, *Star in the Night*, Warner Bros. (Gordon Hollingshead, producer); best film editing, Robert J. Kern for *National Velvet*; best scoring of a musical picture, Georgie Stoll for *Anchors Aweigh*, Metro-Goldwyn-Mayer; best scoring of a dramatic picture, Miklos Rozsa for *Spellbound*, Selznick International; best song, "It Might as Well Be Spring" from *State Fair*, 20th Century-Fox (music by Richard Rodgers, lyrics by Oscar Hammerstein II); best special effects, *Wonder Man*, Beverly, RKO (John Fulton for photography; Arthur W. Johns for sound); best interior decoration—black and white—A. Roland Fields for *Blood on the Sun*; colour, Sam Comer for *Frenchman's Creek*; documentaries—feature, *The True Glory*, governments of Great Britain and the United States of America; short subject, *Hitler Lives!*, Warner Bros. (Gordon Hollingshead, producer); special awards, Walter Wanger for his six years' service as president of the academy; Peggy Ann Garner, outstanding child actress of 1945; *The House I Live In*, tolerance short subject, RKO. (L. O. P.)

Technical Developments.—The American Standards association considered all of the special temporary standards adopted during the war and also reconsidered previously existing U.S. standards for the motion picture industry. As a result there were 23 approved standards. The report of the A.S.A. with a complete list of all of the approved standards is contained in the April 1946 edition of the *Journal of the Society of Motion Picture Engineers*.

Sixteen Millimetre.—Several of the U.S. motion picture producing companies announced plans for, and were actually providing, 16-mm. release prints of their feature pictures for distribution in other countries. It was understood that a considerable number of 16-mm. theatres were in operation in Germany, France and Italy. Plans for such 16-mm. theatres were also believed to be completed for India and China. Similar programs were projected for several South American countries. Although several 16-mm. only feature length entertainment films were produced in 1945, the absence of well-established 16-mm. theatres prevented much additional production of such pictures.

Camera.—The Mitchell Camera company demonstrated a professional 16-mm. camera similar to, and having all of the facilities available for, their NC and BNC 35-mm. professional cameras.

Colour.—Interest continued high throughout the industry in the Agfa colour process as used by Germany during the war; but this film was not available in the United States. What little commercial use was made of the Ansco three-colour reversal film process was in connection with industrial and amateur motion pictures. The Technicolor process continued to be the dominant one in the colour field. Republic and Consolidated Film Industries were using a new two-colour process under the trade name of Trucolor. It was believed that this process used a tinted base and thus achieved an effect between the previous two-colour process and a three-colour process.

The Ansco 35-mm. colour reversal films were known as type 735 soft gradation camera film; type 132 duplicating film and type 732 printing film. These Ansco colour films could be processed on continuous developing machines at either studio or commercial laboratories. The process was relatively simple.

In Aug. 1946, Eastman introduced type 5268 Kodachrome commercial 16-mm. film designed to provide a low contrast colour original from which a colour release print of normal contrast could be made on Kodachrome duplicating film.

Sound.—The year 1946 marked the 20th anniversary of sound

in motion pictures and was appropriately celebrated by Warner Brothers who introduced sound motion pictures to the public.

Although both RCA and Western Electric announced new lines of recording equipment toward the end of 1945, very little of this equipment was delivered and placed in production during 1946. This was largely due to unavoidable manufacturing delays. Some new equipment was, however, shipped to England for the rehabilitation of studios in that country. It was expected that most of this new equipment would become available during 1947.

Several equipment companies announced new theatre type two-way speaker systems and the Research council of the Academy of Motion Picture Arts and Sciences undertook a comprehensive study of such speaker systems. It was expected that this study would permit the Research council to recommend standards for such equipment.

Although the adoption of a control-track system for improved sound reproduction in theatres was reconsidered by the Research council during 1946, no conclusions were reached and no further action was contemplated at the end of the year.

Twentieth Century-Fox and several equipment and film manufacturers were reported to be developing a new system of motion picture entertainment involving a film of 50-mm. width with stereophonic sound recorded and reproduced from three program sound tracks to which may be added a control-track. This activity was in the early development stages and no conclusion had been reached regarding its commercial application.

Film.—No new black and white picture or sound films for standard motion picture purposes were introduced during 1946. The new colour films introduced are covered in the section under COLOUR. DuPont, however, did introduce two new films developed for television purposes; these are types 323 Kinescope recording film for photographing Kinescope images, and type 136 Gamma Pan-2 for photographing live action which is subsequently to be reproduced by television directly from the photographic negative.

Mexico.—The two new studios, Churubusco and Tepeyac, while probably not completed, were in operation. RKO had used the Churubusco facilities and was reported to have plans for considerable production at this studio.

England.—Most of the studios which had been requisitioned by the government during the war were released by the middle of 1946. In most cases considerable alterations were required and the equipment needed a complete overhauling; nevertheless, most of these studios were in restricted production. Considerable expansion of the industry was planned. Reconstruction on the ABPC, M-G-M, and Teddington studios was under way and production was expected to start during 1947. Both Paramount and 20th Century-Fox announced building programs but it would be some time before these projects could be started. Shortages of equipment and skilled personnel were acute.

France.—Several of the French studios continued limited production throughout World War II; others resumed production, but as in England all production activities were seriously handicapped by a lack of skilled personnel and equipment.

Italy.—The motion picture industry in Italy was believed to be particularly handicapped. Much of the sound and photographic equipment was removed from the studios by the Germans and although some of it was returned it was reported to be in very bad condition. At least one of the major studios was believed to be in use as barracks for displaced persons. It was believed that only a small portion of the prewar production had been re-established in this country.

Television.—The development of theatre television equipment was continuing but no equipment of this type was demonstrated or made available for commercial use after the close of

Above: ANNE BAXTER as the ill-fated Sophie in *The Razor's Edge*, a role which won for her the award of best supporting actress of 1946 by the Academy of Motion Picture Arts and Sciences

Above: FREDERIC MARCH (right) and Harold Russell (left), in a scene from *The Best Years of Our Lives*; their performances won them the awards of best actor and best supporting actor of 1946, respectively, from the Academy of Motion Picture Arts and Sciences. The picture, which was adjudged the best picture of the year and the best written screen play, also took highest honours for best direction and best scoring of a dramatic picture

Above: SCENE FROM *The Jolson Story*, for which the Academy of Motion Picture Arts and Sciences awarded Morris Stoll off an "Oscar" for best scoring of a musical picture

Above: OLIVIA DeHAVILLAND in a scene from the film *To Each His Own*. For her performance she was named the best actress of 1946 by the Academy of Motion Picture Arts and Sciences

Below: LAURENCE OLIVIER in a scene from *Henry V*. Olivier received a special award from the Academy of Motion Picture Arts and Sciences for producing, directing and starring in this picture

Below: ANNA AND THE KING OF SIAM, starring Irene Dunne and Rex Harrison, which was given an award by the Academy of Motion Picture Arts and Sciences for the best cinematography of 1946 in the black and white class

the war. The motion picture industry continued to be interested in the possible application of television equipment and techniques to the production of motion pictures but the shortage of such equipment did not permit the investigation of such applications.

(W. V. W.)

Educational Motion Pictures.—The demand for educational films, projectors and accessories for audio-visual education advanced so rapidly in 1946, as a result of the success of films in war training, that producers of films and manufacturers of projectors for school use, in spite of greatly increased production facilities, were unable to fill more than a fraction of their orders. Schools and colleges everywhere in 1946 increased or planned to increase their budgets for the use of films in education. Stimulated by researches and reports of the American Council on Education, the Department of Visual Instruction of the National Education association, the Department of Secondary Teachers of the National Education association, the British Film institute and the committees of many state associations of teachers in the United States, as well as hundreds of newspaper and magazine articles, new educational texts and notable new educational films, directors of visual instruction were demanding a vast expansion of audio-visual methods in education. In New York city, where the budget for visual education in 1946 was \$50,000, Rita Hochheimer, in charge of the city's visual education program, in a report on Oct. 10, 1946, called on the board of education to allocate \$7,000,000 to develop visual methods in the schools during the first year of a proposed program and to spend \$3,000,000 a year thereafter on visual instruction. In New York city it was estimated in the Hochheimer report that the board was spending seven cents per pupil per year for visual instruction.

An indication of the upward trend was the comparative report that Washington, D.C., was spending 35 cents a year per pupil for visual materials; Los Angeles, Calif., 55 cents; Portland, Ore., 60 cents; Buffalo, N.Y., 65 cents; Cleveland, O., 71 cents; Newark, N.J., 79 cents; Rochester, N.Y., 85 cents; Providence, R.I., \$1.13; and St. Louis, Mo., \$1.17.

It was estimated that of approximately 35,000 16-mm. sound film projectors in the schools of the world (excepting the U.S.S.R., for which no reliable data were available), 85% in 1946 were in the United States. Of the 32,000 projectors purchased by the war department of the United States between 1941 and 1946, few became surplus, as did few of the 8,000 purchased by the navy department, most of the projectors in the armed forces being retained for further training or entertainment purposes or else scrapped as unfit for use. The navy department reported that from Dec. 1941 to Dec. 1946, the number of films produced by the navy, coast guard and marine corps totalled 2,165; and that the number of slide films made by these forces during the same five years totalled 2,778. While no official report of war department film and slide film production for these five years was available at the end of 1946, it was estimated that the ground forces and the air forces reports would double the production numbers reported by the navy. Evaluation of the war-born films of the U.S. navy for educational purposes in 1946 resulted in the selection of 500 subjects for distribution to schools and colleges for the navy film vaults.

In order to keep schools, colleges, churches and community organizations informed as to the activities and aims of the United Nations, Jean Benoit-Levy, French educational film producer, was provided with a budget for the production of a United Nations newsreel and documentaries in 1947, in co-operation with United Nations Educational, Scientific and Cultural organization. Distribution of films made under the direction of Benoit-Levy, it was divulged by the United Nations Office of Information in New York, would follow the established

16-mm. channels of the Office of War Information, which completed its notable job in 1945 and which showed the way to reach an audience of some 30,000,000 people in the United States.

The British Information services during 1946 distributed, in the United States, 110 subjects of continuing value, selected from 450 subjects which it distributed during the war. In addition the B.I.S. made available to U.S. schools notable British film versions of scenes from Shakespeare's *Julius Caesar* and *Macbeth*. It was estimated that in 1947 about 1,000 prints of the *Julius Caesar* film would be in circulation in U.S. schools. The British Film institute published in 1946 a report on German Educational and propaganda films as of Jan. 1, 1944. This indicated that all German schools having electricity were equipped with projectors, mainly of the silent type, totalling 45,346 machines and covering 66% of the schools—a ratio 10 times as great as in the schools of Great Britain and the United States. No report was as yet available as to the number of prints of German school films still in existence in 1946, but it was known that in 1944 the nazis were using 592,000 prints as media of mass educational propaganda.

The University of Chicago, Chicago, Ill., maintained in 1946 its leadership as a world centre for the development of classroom films and of techniques for their utilization. Encyclopædia Britannica Films Inc., operating with the University of Chicago, completed in 1946 24 new classroom film subjects and began the year 1947 with a catalogue listing some 500 school and college films, of which about 100 were provided with foreign-language sound tracks and were being distributed throughout the world. Most widely used E.B.F. films were reported to be those on physics and human biology. In the elementary field, *Adventures of Bunny Rabbit* was reported in greatest demand.

Coronet Instructional Films, Young America Films, Simmel-Meservey and a number of smaller firms all reported rapid gains in demand for their films in 1946.

Most notable activity among major film companies in the development of 16-mm. departments in 1946 was that of Universal Pictures Co., Inc., which set up, in co-operation with the British companies of J. Arthur Rank, a new subsidiary, United World Films, Inc., which acquired by purchase the Bell and Howell Filmosound library of 6,000 short subjects and features in 16-mm. as well as the business of Castle Films, a leading producer and distributor of home movies and a distributor of government and industry-sponsored films. The merger of the Castle organization and the Bell and Howell library organization in United World Films combined the advantages of the trained personnel of those organizations with the resources of the Universal and Rank 16-mm. divisions. As a result, United World Films was able by the end of 1946 to launch a plan for the production and world-wide distribution of 16-mm. and 8-mm. educational, religious and family-entertainment films. It revealed a 7-year production program for the making of 100 pictures a year, half of which were to be made in New York under the supervision of Edmund L. Dorfman, and the rest in London by the Rank subsidiary, G.B. Instructional, Ltd., under the supervision of Ian Cremieu-Javal. The films were to be prepared in 38 languages for the world market and were to include adaptations of 25 to 50 G.B.I. science films made by Julian Huxley. It was revealed that Dorfman would go to England in 1947 to adapt the Huxley reels to the U.S. market, for lease to schools and colleges at \$35 to \$50 a reel for 5-year periods.

Other major U.S. film companies were mainly interested in the foreign market for 16-mm. versions of their pictures, though a few of them, notably RKO, began to market such versions in the United States through their own or independent distributing organizations.

Two new organizations entered the educational filmstrip field in 1946—the audio-visual division of *Popular Science Monthly* and Curriculum Films, Inc., both in New York. In addition, Encyclopædia Britannica Films Inc., launched a filmstrip program. The Society for Visual Education, Inc., with headquarters in Chicago, Ill., continued as the leading producer and distributor of filmstrips and 2x2 film slides, as well as the leading manufacturer of filmstrip projectors, although a number of new slide projectors were placed on the market by other firms.

McGraw-Hill Book Co., Inc., became in 1946 the first textbook publisher to launch a program of film and filmstrip production to supplement widely used texts. These films, it was announced by James S. Thompson, president of McGraw-Hill, would be ready for release in the spring of 1947. It was announced that the first program would cover four books dealing with engineering drawing, mechanical drawing, healthful living and student-teacher training. Each of the books, Thompson said, would be supplemented by a series of six or seven 16-mm. sound motion pictures and a like number of co-ordinated filmstrips. The films were being produced by Albert J. Rosenberg, previously associated with the U.S. office of education in the making of wartime industrial training films. The McGraw-Hill plan, it was explained, was to offer book, films and filmstrips as a complete package for the application of audio-visual methodology, especially in relation to the more difficult chapters of the book. The textbook, it was pointed out, would continue as the basic source of information, but the proper utilization of the filmic materials was expected to speed the work of the teacher. Each pictorial treatment was being planned to give extended coverage of difficult subject matter, rather than to duplicate parts of the book pictorially. Assigned to handle the technical production of the McGraw-Hill reels were three commercial firms in New York.

In 1946 a group of seven educational publishers, including Harcourt, Brace and company, Harper and Bros., Macmillan company, Houghton Mifflin company, Henry Holt and company, Scott-Foresman and Scholastic Magazines, made a joint survey to determine whether textbook publishers should participate in the development of educational films. These firms at the end of 1946 were co-operating with the American Council on Education in a project to produce several experimental text films, using resources of theatrical film interests and commercial producers, with headquarters at New Haven, Conn., and with Gardner Hart, formerly director of visual instruction in the Oakland, Calif., schools, as co-ordinator.

At the end of 1946 the National Broadcasting company revealed that most of its television programs would be on film and that a good many of the films would be educational shorts, including E.B.F. classroom films.

The first yearbook of the 16-mm. industry appeared in 1946. This was published by the Allied Non-Theatrical Film association and met with success. The second *ANFA Yearbook*, edited by William Lewin, was scheduled to appear in 1947. Periodicals devoted to educational films included in 1946 six in the United States (*Educational Screen*, *Film and Radio Guide*, *Film News*, *Film World*, *See and Hear* and *16mm Reporter*) and two in Great Britain (*Sight and Sound* and *16 Mil Film User*).

Among notable new books dealing with educational films, six appeared in 1946: *Movies That Teach*, Hoban (Dryden Press), *Audio-Visual Methods in Teaching*, Dale (Dryden Press), *Audio-Visual Paths to Learning*, Wittich and Fowlkes (Harper), *Teaching With Films*, Fern and Robbins (Bruce Pub. Co.), *The Preparation and Use of Visual Aids*, Haas and Packer (Prentice-Hall), and *The Art of the Motion Picture*, Benoit-Levy (Coward-McCann). The *Hollywood Quarterly*, as a supplement to its volume I, published in 1946 its first *Annual Communications Bibliography* (Univ. of Calif. Press).

Great Britain.—After the return of government-requisitioned studio space, completed by April 1, 1946, it was expected that most British studios would be in full production by Jan. 1947. This was expected to bring about a sharp rise in the number of films made, and the quota of British production which British exhibitors were required to show was fixed at 17½% for 1946 and 22½% for 1947. The board of trade also

reached an agreement with the Rank circuits (Odeon and Gaumont-British) and the Associated British Cinemas circuit (in which Warner Brothers held a substantial share interest) that in addition to their quota commitments they would show a small number of independently-produced British feature films. This was the first gesture of the board of trade towards independently-financed feature production in Britain, which was almost eliminated by the mass studio ownership of the Rank organization and Associated British Picture corporation (the company affiliated with the A.B.C. circuit). Another production corporation was formed by the Alexander Korda-British Lion amalgamation during 1946.

The chief British feature films of the year were *The Captive Heart* (Ealing studios), *I See a Dark Stranger* (Individual Pictures), *Men of Two Worlds* (Two Cities productions), *Theirs Is the Glory* (Rank organization), *The Overlanders* (Ealing studios, made in Australia), *A Matter of Life and Death* (Archers productions), *School of Secrets* (Two Cities) and *Great Expectations* (Cineguild). Documentary production was on a very high level with the feature-length films *Children on Trial* (Crown Film unit), *Land of Promise* (Films of Fact), *The Way We Live* (Two Cities) and the shorter films *Cyprus Is an Island* (Greenpark) and *Defeated People* (Crown) about contemporary Germany. The widespread nontheatrical distribution of documentary continued under the central office of information, successor to the wartime ministry of information. The scheme was parallel to that organized during the war in Canada by John Grierson, who resigned his position as government film commissioner in order to produce a series of international documentaries from the United States. The first "royal command" performance of a film was given in Nov., when the royal family attended a showing of *A Matter of Life and Death* at the Empire theatre, London.

Europe.—Film production in France was seriously compromised during 1946 on economic issues. A producer's strike was threatened early in the year on the grounds that the high taxation with which the industry was burdened made production impossible. In the summer a supplementary agreement to the Franco-U.S. loan reduced the protection so far afforded to the French film in the face of the imported product. Among the important films either released during the year or in production were the resistance film *La Bataille du Rail*, Jean Cocteau's fantasy *La Belle et la Bête*, Marcel Carné's *Les Portes de la Nuit*, a poetic-realistic study of a night in a Paris suburb and Rouquier's *Farrebique*, a remarkable feature-documentary of life on a southern French farm. An international film festival was held at Cannes in September.

Festivals of French, Russian and British cinema were held in Czechoslovakia, whose film industry was nationalized in 1945. The large Barrandov studios near Prague provided ample studio space for Czechoslovakia, supplemented by other smaller studios, some in Moravia and Slovakia, specializing in admirable educational, documentary, cartoon and puppet films. The Czechs used Agfa colour in some of their productions. Their best feature films were those dealing with contemporary themes, such as the resistance movement during the occupation: *Men without Wings* is a brilliant example. Russia completed a beautiful if somewhat theatrical legendary film *The Stone Flower*, in Agfa colour, at the Barrandov studios. The Russians also developed their own three-colour system and intended to increase the number of their productions in colour. Stereoscopic production was represented by *Robinson Crusoe*, which was begun in 1945.

Soviet production was reviving in all centres, especially in Moscow, Leningrad, Kiev, Tbilisi and the central Asian studios. On the other hand there was an official ideological tightening of the expression of soviet directors, and S. Eisenstein's *Ivan the Terrible* (part II) was banned on the grounds of ideological unsuitability in the presentation of the tsar character. Production aimed at 40 feature films a year, the number to be doubled by 1950.

Another nationalized industry was that of Poland which was reconstructing its damaged cinemas and planning the construction of new studios near Warsaw. German and Italian film production was revived, the former under the supervision of the occupation authorities. Spain developed production in terms of quantity rather than quality, and was anxious to gain distribution in the Latin-American countries. Sweden continued to make notable films, its production rate reaching as many as 50 feature films a year. Light comedy made up a fair proportion of the output, but the most impressive contribution to the cinema lay in the psychological films. Pictures such as *Hets* (Frenzy) proved that Sweden could equal in achievement the most progressive contemporary film art. *Waiting Room of Death*, completed in 1946, belonged to this movement in Swedish production. (See also PHOTOGRAPHY.) (R. MAN.)

Motor-Boat Racing. Long standing records in Gold cup speed boat competition were surpassed at Detroit, Mich., on Labour day, 1946, when Guy Lombardo's "Tempo VI," in winning the classic event, covered the 90 mi. at an average speed of 68.072 m.p.h., and averaged 70.88 m.p.h. for one of the 30-mile heats, while one of her rivals, Dan Arena's "Miss Golden Gate III," set a new one-lap mark of 77.911 m.p.h. Just previously "Tempo VI," which as "My Sin" had won the 1939 and 1941 Gold cup races but at lower speeds, had taken the 1946 national sweepstakes at Red Bank, N.J.

Bought by Albin Fallon and driven by Daniel Foster, the former "Miss Golden Gate III," renamed "Miss Great Lakes III," turned the tables on "Tempo VI" shortly after the Detroit regatta by winning the President's cup at Washington, D.C. In the latter regatta, Gibson Bradfield's 225-cu.in. hydroplane "Buckeye Baby" won the Thomas trophy.

SPEEDBOAT "Miss Great Lakes," driven by Danny Foster of Detroit, Mich., won the first postwar President's Cup race before President Truman and spectators in Washington, D.C., on Sept. 22, 1946.

In England, Sir Malcolm Campbell was working, during the latter part of 1946, on a jet-propelled boat with which he hoped to better his own world's boat speed record of 141.7 m.p.h., made in 1939, but due to the lateness of the season, the attempt was postponed until 1947.

One new outboard motor speed record was made in 1946, in the Midget class, by D. Whitfield's boat, running at Washington, of 41.478 m.p.h. in a one-mile trial.

No new racing motors, either inboard or outboard, were produced during the year, most of the racing being done with old motors or those converted from other uses. (H. L. ST.)

Motor Transportation. There were strikes in and out of the industry in the U.S. in 1946, there were shortages of materials and supplies more acute in some instances than those experienced in wartime, there was inability to secure delivery of new buses and trucks intended to supplement or replace vehicles that long since should have been replaced and there was the general spiral of increased costs, including wage readjustments upward, which could not, as in some other lines of endeavour, be offset at least in part by technological improvements or by passing along some of the increased costs to the consumer.

All these factors contributed to delay programs of the carriers calling for changes and improvements running into the millions.

Production Figures.—Despite adverse factors new buses and trucks were being produced at the end of 1946 in ever-increasing volume even though not in quantity sufficient to meet anything like the immediate demands of the carriers. The extent to which the industry needs were met is in part instanced by the 24,174 bus production figure for the year. That was an all-time high for all types of units. Of the 24,174 buses built during the year, 12,025 were school buses, 11,635 common carriers and 496 were for government agencies. The 1945 total was 17,641, of which 8,225 were school buses, 9,416 common carriers and 5 for government agencies.

For the automotive industry as a whole, however, 1946 was a

year of low volume, stop-and-go production. In consequence, output was estimated at 2,145,000 new passenger cars. This was 57% of the 1941 total of 3,755,309. Truck assembly in 1946 was about 935,000. This was 89% of the 1941 figure of 1,042,085, but that figure included 219,000 military vehicles. Replacement parts were turned out to the value of \$1,600,000,000, or more than double the 1941 total of \$718,000,000. In this last figure allowance must be made for the added dollar value of the product.

In only one respect in the production field did there appear to be a return to more or less normal conditions. The bus and truck tire goal for 1946 was 13,680,000 units. Production was estimated at 15,900,000 units compared with 8,221,000 in the record prewar year of 1940. Production of about 2,000,000 more tires than the goal was in response to continued unprecedented demand.

As in the case of the motor buses, manufacturers of trolley buses were unable to satisfy the demand for deliveries with the result that the 41 operators of this type of vehicle received only 332 new vehicles. The largest number went to the Georgia Power company with the second largest number, 39, to the municipal transit system in Cleveland, O.

Operating Trends.—Plans for modernization of bus companies and many streetcar lines with buses and trolley buses still to be carried out, called for the expenditure of about \$175,000,000. Perhaps the most notable of the changes was the conversion late in the year of four lines of the Third Avenue Transit corporation in New York to all-bus operation. So far as the borough of Manhattan was concerned there were only four left and these were to be converted during 1947. Another significant move in Manhattan was the substitution of single-deck buses by the Fifth Avenue Coach company for the open-top, double-deck buses. The enclosed type of double-deck bus still remained.

In the city and the intercity field 1946 saw the carriers extend the use of the two-way short-wave radio system of communication. Increased impetus was given to the intercity two-way program by the action of the Federal Communications commission which in August allocated frequencies for the exclusive use of the long-haul motor bus carriers.

In the city field the San Antonio Transit company put an air-conditioned bus in operation as the first of the vehicles on an order of 100. In Atlanta, Ga., an air-conditioned trolley bus was placed in operation and early in January the first prefabricated trolley bus ever built in the United States was demonstrated in Toledo, O.

School Bus Service.—More than 80,000 buses were used daily to transport school children throughout the United States in 1946. Nation-wide statistics revealed the extent to which this service was preserved. Successful operation of these vehicles continued under an almost complete revaluation of operating practices, of maintenance and housing and even of specifications, to say nothing of the training of drivers and mechanics. As for the school bus of the future it appeared likely that it would be constructed of lighter materials and that motor speeds would be governed as a step toward further safety.

Road-Rail Carrier Co-ordination.—Recommendations of the Railway Business association for co-ordination of all forms of transport by lifting legal limitations on one type of carrier engaging in other modes of transportation made late in Dec. 1946 focused attention on the co-ordination of railroad and highway service. Many of the major railroad systems had non-rail transport services of one kind or another. They included over-the-road movement of freight in less-than-carload lots, station-to-station transfers, collection and delivery by trucks, bus lines and other forms of highway operation. Twenty-five Class I railroads had rail-highway services for handling less-than-carload lots of freight on 65,000 route-mi.,

and co-ordinated rail-bus services amounting to 75,400 route-mi. Twenty-nine principal railroads employed trucks as an efficient and economical substitute for way-train service, providing rail-motor service to about 8,600 stations. In 1946, however, the highway operation of the railroads was to a large extent auxiliary or supplementary to rail services and was relatively small in extent in so far as the total freight service was concerned which was handled over the 228,000-mi. railroad network reaching every part of the United States. It was on the basis of the growing need for more efficient, economical and stable transport that the Railway Business association recommended the elimination of any provisions of federal law or administrative interpretations which restricted voluntary co-ordination among the several types of interstate transport. The end sought was to put all forms of transport on a fair and equal footing under regulation by a single agency, with co-ordination determined on the basis of the public interest and without permitting monopoly to any one type of transport.

Taxis.—During World War II the number of cabs licensed in any given community was frozen by the Office of Defense Transportation as a conservation measure. Only in exceptional cases were existing operators permitted to enlarge their fleets or secure gasoline for extra mileage. The inevitable shortage of customary taxi service thus imposed led the public to criticize existing operators unjustly.

With the close of World War II petitioners clamoured for licences, often citing the wartime shortcomings as evidence of the need for more service. Many of these applications were from groups of sincere or pretending G.I. owner-drivers. In some cities individual one-man permits were granted to the former servicemen with the clear understanding that if at any time the holder sold or otherwise disposed of the equipment, the regulatory commission would not countenance the transfer of the operating rights to the purchaser of the vehicle or to any other person. This limitation was definitely upheld in a decision made by the Maryland Public Service commission on Nov. 15, 1946, when it refused to approve the transfer of G.I.-style permits.

With a reduction of war emergency taxi service, taxi operators in many cities found their earnings diminishing. Two major reasons were advanced for this: first, there was less need for speed on the part of the cab patron; second, there were more cabs. (See also *AUTOMOBILE INDUSTRY*; *HORSES*; *MUNITIONS OF WAR*.) (C. W. S.)

Great Britain.—Transport was crippled in 1946 by a general shortage—shortage of new vehicles, of spare parts for vehicles, which had far outlasted their usual term, and of liquid fuel. One of the few bright spots was the way in which the highways had stood up to six years of war traffic, practically without maintenance. There was, however, a dearth of strategic highways (e.g., the River Severn bridge which was being seriously considered in 1946) which should have been constructed out of moneys provided by the road users between World War I and World War II.

The motor manufacturing industry made a commendable "switch-over" to production of cars (84% of prewar output) and of buses and trucks (50% more than prewar output), but bottlenecks caused by shortages of steel and many other commodities delayed the work. The total production was nevertheless satisfactory, but the economic situation demanded that a large portion should be earmarked for export. As a consequence, the price of second-hand cars was generally in excess of the price of new ones and a black market in new cars grew up, partially checked toward the end of 1946 by an agreement on the part of the buyer not to resell under six months. Buses were scarce everywhere; many of the larger undertakings had placed orders running into millions of pounds with delivery promised a year or two later. Very rough vehicles were kept in service and queues were inevitable; there was a slow but general realization that the morning and evening peak loads could be met only by a staggering of hours. The 500,000 goods vehicles were mostly in poor shape; many were unroadworthy and few new ones were delivered. Various pooling schemes to economize in mileage were still in being and long-distance road transport, which was released from government control on Aug. 16, needed to be fully extended because railway engines and rolling stock were 30% to 40% below their prewar operative figure. Liquid fuel was strictly controlled by a rationing system for all road vehicles; private car owners received a small basic allowance.

The bill for the nationalization of transport passed its first and second readings in December, bitterly opposed by all traders (users of transport) and all providers (rail, road, canal and coastwise). A public inquiry was demanded to ascertain, conditioned only by the public interest, the best inland transport system. The bill produced the largest opposition vote against the existing government, the opposition declaring its intention to pass a vote of censure on the government. The stock exchange took an unprecedented course in making a scathing denunciation of the bill. (See also *ACCIDENTS*; *RAILROADS*.) (L. GL.)

Motor Vehicles: see *AUTOMOBILE INDUSTRY*; *ELECTRIC TRANSPORTATION*; *FEDERAL BUREAU OF INVESTIGATION*; *MOTOR TRANSPORTATION*.

Mott, John R. (1865–), U.S. evangelist, was born May 25, in Livingston Manor, N.Y. After graduating from Cornell university in 1888 with a Ph.B. degree he became affiliated with the Y.M.C.A., and in 1895 he helped organize the World's Student Christian federation in Sweden. A Methodist, Mott was active in church and missionary movements at home and abroad and made frequent trips throughout the world in the interest of the World Mission of Christianity.

The World Federation of Churches was an outgrowth of his work in unifying the church movement. Mott continued his association with the Y.M.C.A. for many years—in the capacity of general secretary of the international committee, 1915–31, foreign secretary, 1898–1915, general secretary of the national council until 1928 and chairman of the world's committee after 1926. During World War I he had charge of the Y.M.C.A.'s canteen and prisoner-of-war work. He spent the early months of 1946 in Europe aiding with the problem of displaced persons. He was given the Nobel peace prize on Nov. 14, 1946 for his participation in five world church and missionary movements, sharing the award with Miss Emily Greene Balch, U.S. economist.

Mount Holyoke College. An institution for the higher education of women in liberal arts, founded in 1837 by Mary Lyon and situated at South Hadley, Mass. The campus covers nearly 600 ac. with more than 70 buildings. Registration figures for the 1945–46 session included 1,113 undergraduates and 36 graduate students, representing 39 states and territories and 5 foreign countries. (For statistics of endowment, enrolment, faculty, library volumes, etc., see *UNIVERSITIES AND COLLEGES*.) (R. G. HA.)

Muller, Hermann Joseph (1890–), U.S. geneticist, was born on Dec. 21 in New York city. Attending Columbia university, he received his A.B. degree in 1910 and his Ph.D. degree in 1916. He taught biology and zoology at Rice institute (Houston, Tex.) and at Columbia and while associate professor of zoology at the University of Texas (1920–25) began his research in the problems of heredity. He subsequently became a full professor at the latter school (1925–36) and was senior geneticist at the Institute of Genetics and a staff member of the Medicobiological institute, both in Moscow (1933–36). Dr. Muller was lecturer at the Institute for Animal Genetics, University of Edinburgh, 1937–40, research associate in biology, Amherst college, 1940–42 and professor, 1942–45. He joined the Indiana university faculty in 1945 when the Rockefeller foundation made a grant to that school for a research program in the field of genetics. In Oct. 1946 he received a grant from the American Cancer society for the study of cancer. His work in heredity changes and mutations caused by X-rays striking the genes and chromosomes of living cells took on added significance when speculation began to arise after the dropping of the atomic bomb on Hiroshima and large-scale human contamination with powerful rays became a reality. He was awarded the Nobel prize in medicine and physiology on Oct. 31, 1946.

Municipal Government. The first full year of reconversion to peace found the cities of the United States facing problems of greater magnitude and gravity than at any other time from the depression years. Foremost was the need for increased revenues at the local level to meet rapidly expanding municipal budgets, which in turn involved the whole question of local-state-federal interrelations and the basic issue of "home rule." A nation-wide wave of strikes by municipal employees imposed a new function on local governments: the regulation of labour relations in municipal employment. The housing crisis continued unabated with the collapse of the national veterans' emergency housing program in December. Traffic and parking crises in major cities went for the most part unsolved. Perhaps most serious of all was the general

apathy on the part of citizens both as to current conditions and future goals.

Municipal Labour Relations.—One of the most dramatic trends in municipal administration in 1946 was the outbreak of strikes and threats of strikes by local government employees in city after city from coast to coast. In Pontiac, Mich., practically all municipal services except fire and police were halted, though utility services were kept functioning by maintenance crews. There were strikes by city school teachers in Norwalk, Conn., and St. Paul, Minn. Strikes by public works employees occurred in several cities, including Bangor and Portland, Me., Wellston and Canton, O., and McKeesport, Pa. Garbage collectors went on strike in Tulsa, Okla., and Louisville, Ky. Indianapolis, Ind., Dearborn, Mich., Milwaukee, Wis., Rochester, N.Y., and New York city were among the cities threatened with strikes. Threatened strikes by New York city subway employees were twice averted during the year, but transit workers were finally granted a pay raise which was made retroactive to July 1.

Remedies against striking municipal employees took various forms. Some cities resorted to the courts and secured injunctions against strikes or threatened strikes—e.g., Tulsa, Okla., and Milwaukee. Omaha, Neb., adopted antistrike ordinances. Portland, Me., required all employees to sign an antistrike pledge. A number of strikes were ended by threatening employees with loss of jobs. Three states—Arizona, Nebraska and South Dakota—adopted constitutional amendments barring the closed shop, making a total of 11 states which regulate agreements between municipalities and unions of employees. At least four cities—New York, St. Louis, Mo., Louisville, Ky., and Toledo, O.—set up labour relations agencies to deal with strikes threatening the welfare of the community. A number of court decisions upheld the right of local governments to prohibit membership of municipal employees in labour unions.

Municipal Finance.—A turning point in the history of municipal finance was reached in 1946. The crisis foreseen during the relatively quiescent period of the war years—when revenues were up, tax delinquencies down, services curtailed, equipment and personnel at a minimum, debts discharged and budgets stabilized—came to a head. Increased personnel, expanded services, increased costs of equipment and supplies, resumption of the unprecedented rise in pay rates for municipal employees resulted in soaring budgets and presaged an upturn in municipal debt. To cite a typical example: St. Louis, Mo., faced a \$1,000,000 deficit for the fiscal year ending April 1, 1947. The operation and maintenance budget for 1946-47 exceeded expenditures for 1945-46 by \$5,700,000 or 21%, and exceeded expenditures for 1939-40 by 52%. Salary raises since the signing of the budget and the sharp rise in prices for supplies made large supplementary appropriations necessary. Appropriations for salaries and wages exceeded those for 1939-40 by 45% and with the subsequent increases would exceed them by 56%. Appropriations for supplies and equipment, based on April 1946 prices, exceeded those in 1939-40 by 92% and most supplies had increased sharply in price after that date.

The story could be repeated ad infinitum. In California, the Los Angeles general budget for 1946-47 was 38.8% above that for 1945-46, that for Richmond was 19% higher; for Oakland 29% higher; for San Francisco 28% higher; for Berkeley 27% higher, and so on. Pittsburgh's budget for 1947 reached \$28,800,000—\$2,600,000 in excess of 1946 and the highest after 1931—chiefly because of a 10% salary raise. Philadelphia's 1947 budget of \$100,000,000—the largest in its history—exceeded the current budget by \$13,700,000 and expenditures of 1945 by \$15,800,000; pay rolls comprised about 57% of the total budget. New York city's over-all budget of \$865,000,000 for 1946-47 was the highest in its history; but that for 1947, it was predicted, would about reach the \$1,000,000,000 mark, almost entirely a result of pay increases for municipal employees after Nov. 1, 1946. A survey by the International City Managers association toward the close of the year of 17 representative cities between 10,000 and 200,000 population showed that nearly all were curtailing construction of capital improvements because of 100% increases in building costs, coupled with an immediate need to pay higher wages and expand some city services regardless of cost. Expenditures were found to be from 2% to 46% higher than 1945 and budgets for 1947 to be higher still.

In the face of the rising fiscal flood which threatened to engulf them, the cities made valiant efforts to rid themselves of the financial strait jacket imposed by their traditional dependence for about 90% or so of their tax revenues on the local property tax, which in many cities had already reached its maximum return. New revenue sources were developed at the local level on an unprecedented scale. Income or pay-roll taxes—first utilized by Philadelphia in 1939—were imposed in Toledo and St. Louis. Taxes on hotel room occupancy were adopted first in New York city and later in Providence, R.I. Sales taxes were adopted by a score or so of California cities and utility taxes in about 30 Florida municipalities. Admissions, cigarette and tobacco, retail sales and other taxes and new or increased service charges and licence fees of all kinds were imposed in literally hundreds of cities throughout the country. Often a program of new charges or taxes was adopted as a group, after intensive study of the local social, economic and political setup.

At the same time many states, including specifically Alabama, California, Louisiana, Mississippi, New York, Ohio and Pennsylvania, made new or increased distributions of state revenues to local governments. In others, including Indiana, Michigan, New Jersey, Oregon and Rhode Island, state commissions had been appointed to consider the local revenue problem and report their findings to the 1947 legislatures. A survey by the International City Managers association showed that all

states except five—Florida, Kentucky, Nevada, Texas and Vermont—were sharing some of their taxes with the cities. An important study, *Where Cities Get Their Money*, published by the Municipal Finance Officers association in 1946 summarized the success of the cities in tapping new revenue sources.

Particular reference should be made to the revolutionary plan for the stabilization of local finance evolved by the Moore [state] Commission on Municipal Revenues in New York State after two years of research and put into effect in 1946. It provided for the distribution of state revenues to the cities, towns and villages annually on a per capita basis of \$6.75, \$3.55 and \$3.00, respectively; also for the establishment of reserves to be drawn upon in depression periods, thus insuring continuation of the per capita payments. The local share of home relief, old-age assistance, aid to dependent children and aid to the blind was reduced to and stabilized at 20%, with the state assuming the difference between 80% of those costs and the federal contributions therefor—a provision designed to relieve local real estate taxpayers of a substantial part of the cost of these services and secure the local governments against the effects of another major depression. Together with additional state aids, the new program increased state assistance to the localities by more than \$50,000,000 annually. The plan evoked nation-wide interest.

The decline in tax delinquency maintained continuously after 1933 continued; median delinquency for selected cities of more than 150,000 population had reached a low of 3.3% by the close of 1945—the latest period for which data were available. Municipal tax rates for 1945-46 showed an increase for the third successive year; the gain of \$0.52 per \$1,000 of assessed valuation was the largest in eight years; rates were notably higher in the larger cities. Assessed valuations likewise increased for the fifth consecutive year; the average gain of 5.3% more than 1945 was the greatest after 1932, when these figures were first recorded, and applied in all classes of cities.

According to the *Bond Buyer*, state and municipal bond issues in 1946 totalled \$1,200,000,000, an increase of more than 46% in excess of 1945, and more than double the total for 1943 (\$500,000,000) which marked the lowest point in municipal borrowing after World War I. It was still slightly less than the all-time high of \$1,500,000,000 for 1940. In the November elections, a total of \$1,043,000,000 in proposed bond issues—an all-time record—was approved, and \$89,000,000 rejected; state funds, mostly for veterans' aid, accounted for \$837,000,000 of the approved total, while local issues amounted to \$206,000,000, only a slight increase in excess of the \$191,000,000 submitted in 1945. Bonds for local improvements in nine major cities totalling \$40,000,000 were rejected by the voters. Municipal bond interest rates reached an all-time low in the spring of 1946 of 1.29%, according to the *Bond Buyer's* index for 20 municipal bonds. The index opened the year at 1.42%, declined to the record low of 1.29% in March and April and rose in December to 1.91%, following the bond-issue approvals in November with their suggestion of greatly enhanced investment supply. While state and local governments were borrowing in larger amounts, the increase was still more than offset, in the aggregate, by debt retirements during the year, and the reduction in local debt which commenced in 1942 was larger in 1946, both in absolute amount and in percentage of reduction, than in 1945. Outstanding local debt as of June 30, 1946, was \$13,564,000,000, compared with \$14,164,000,000 in 1945. On an index basis of 1940=100, the annual volume of local debt for each of the five years 1942 through 1946 was: 98.6, 94.4, 87.9, 84.7 and 81.1, respectively.

Postwar Planning.—In general, the planning programs of municipal governments presented a far from adequate approach to the problems of urban reconstruction. The second report of the bureau of community facilities of the Federal Works agency, issued late in 1946, was specifically designed to give a comprehensive view of the status of the plan preparation of state and local public works, both with and without federal financial assistance, as of June 30, 1946. An additional grant of \$35,000,000 in June 1946 had made a total of \$65,000,000 available under the program of federal planning advances, almost all of which, however, was accounted for by applications already under review. Advances approved through June covered public works with an estimated total cost of \$1,110,000,000 and a construction cost of \$930,000,000. It was estimated that the entire \$65,000,000 would provide planning advances for a volume of public works amounting to about \$2,100,000,000 in terms of construction costs. The foregoing data are exclusive of housing projects and of advances under the federal-aid highway program, which fall in a separate category.

Plans completed without federal aid through June 1946 covered state and local public works with an estimated construction cost of \$1,125,000,000; plans in the design stage—the completion of which without federal aid was very uncertain—were reported for public works with estimated construction costs of about \$4,000,000,000. In several states, local planning was aided by state grants, and in Indiana by loans. Plans completed without federal aid were heavily concentrated in a few states, particularly New York, and a few large cities; 60% of the 11,926 governmental units reporting in this group had no plan preparations in either the completed or design stages, and almost one-half of those were cities, towns and townships of less than 10,000 population.

The purpose of the federal program for planning advances was to build up an adequate reserve of nonfederal public works to be put into construction as economic conditions might warrant; also, to give such planning a wider geographic range and a more extensive spread among the smaller governmental units, particularly cities and towns with populations of less than 50,000. Of the 1,524 cities and towns receiving advances, 53 were in the population group of 100,000 or more, 35 in the group from 50,000-100,000 and 1,436—almost 95%—in the group of less than 50,000; in terms of construction costs for these cities and towns, 54% was for those of less than 50,000 population, contrasted with only 25% in the case of plans completed without federal aid. Preference was given to the type of public works required for an expansion of housing, such as sewer, water, sanitation and educational facilities.

A survey by the International City Managers association covering

700 cities revealed that cities were spending about 50% more for municipal planning in 1946 than in 1945; more than 85% of the reporting cities of more than 25,000 population had either official or unofficial planning agencies, while 30% of the cities in the 10,000-25,000 population group had no planning agencies.

The traffic and parking crisis which developed in the municipalities with the return of normal motor traffic after the war remained largely unsolved.

Personnel.—Data on state and local government employment in 1946 showed a current level of employment substantially higher than in the prewar period. Total state and local government nonschool employees as of April 1946 were 2,000,000, compared with 1,800,000 the year before, and by July had reached an estimated 2,100,000, the highest total recorded after the inception of these surveys in Jan. 1940. Pay rolls increased from \$253,800,000 in April 1945 to \$295,800,000 in April 1946, and by July 1946 had reached an estimated \$309,000,000. July 1946 pay rolls were 40% more than those of July 1940, whereas corresponding employees numbered only 3% more than in July 1940. Information on the number of school employees was tabulated by the census bureau for the first time in 1946.

Council-Manager Cities.—Far more cities adopted the council-manager plan than in any previous year: a total of 75, compared with the previous high of 47 in 1921, bringing the grand total for the United States to 693. Madison, Wis., was the largest city adopting the plan in 1946; it was rejected in Chattanooga, Tenn., by only 612 votes. Toledo, O., defeated for the fourth time proposals to abandon the plan. It was adopted in Hartford, Conn., subject to ratification by the state legislature. (A. M. Ds.; L. Gu.)

Great Britain.—Local authorities throughout the year were busy with many reconstruction problems, of which housing was in the forefront. Temporary houses were set up on numerous sites, and large programs for permanent housing were put under way. Difficulties because of shortages of labour and materials (which lay at the root of the problem) were by no means dispelled. The bias of effort, hitherto mainly absorbed in the long, tiresome process of planning of ways and means, shifted more and more as the year went on toward the work of actual construction. The end of the year gave promise of the general speeding up of building activity.

Local authorities were much occupied with the completion of their development plans under the Education act, 1944. This preliminary phase, necessary in all large-scale projects, produced little surface result but was a period of intense preoccupation with the fundamentals of public education in all its aspects.

The town-planning fervour, which had been stimulated by the issue in previous years of the postwar plans for many areas, and which had given place to the more solid work of attempting to bring the plans into effect, was revived by the proposed application of the New Towns act, 1946, to certain localities, including Hemel Hempstead and Stevenage in Hertfordshire, and Crawley and Three Bridges in Sussex. Public local inquiries all over the country on planning projects provided much work and interest.

The local government boundary commission and the boundary commissions for dealing with parliamentary electoral areas in England, Wales, Scotland and Northern Ireland, were busy. The work of the latter commissions received a severe check because of the difficulty of reconciling parliamentary and local government areas. The government committee set up under the chairmanship of the marquess of Reading to review the boundaries of the metropolitan boroughs and the distribution of functions between London local authorities ceased to function during the course of the year. The attempt to deal with the administrative county of London alone, without dealing with the larger problem of greater London, was felt to be of little value.

Late in the year the Civic Restaurants bill was introduced to empower local authorities to carry on the service provided by the British restaurants.

Disquiet persisted throughout the year at the uncertain future of local government. Important functions were to be taken from local authorities; hospital services were to be transferred to regional boards under the National Health Service act, 1946; proposals were made for the transfer to the government of the noninstitutional relief of the poor and the blind. Many local authorities were electricity suppliers and some had their own tramway or omnibus undertakings: the projected nationalization of electricity supply and transport might involve the curtailment and even the surrender of these undertakings. It was felt that the local government system must soon be revised; regionalism had already been alluded to by government spokesmen. (See also AIRPORTS AND FLYING FIELDS; HOUSING.) (W. E. J.)

Munitions of War. **Army.**—At the Fort Sill Artillery conference in March, one of the weapons demonstrated was the self-propelled 240-mm. howitzer. In World War I this weapon moved in four loads; in two during World War II. It and the 8-in. howitzer are both independent of a prime mover. In the heavy weapons class, three interesting weapons reached the U.S. from Germany. They were in the top flight of Germany's artillery weapons, two 231-ton guns and a 123-ton mortar. The two guns are 28-cm. and 31-cm. bore respectively, both Krupp manufactured. The mortar, known as "Thor," is a 54-cm. weapon, mounted on a self-propelled carriage and was used against the Russians at Sevastopol and Stalin-grad. Remains were also discovered near Frankfurt, Germany, of a supercannon "Gustav Geshutz" used to blast Sevastopol in

the Crimea. This gun, and its companion piece called "Dora," dwarf any other big guns built. Gun and carriage weighed 1,344 tons; diameter of bore 31.5 in.; weight of powder charge 2,500 lb.; weight of projectile 16,540 lb.; length of barrel 105 ft.; effective range 51,000 yd.

In October, a weapons show was staged at Aberdeen Proving grounds, Md., to reveal U.S. progress in new weapons. These included the new .60-calibre machine gun, the 75-mm. and 105-mm. recoilless rifles, the M-1 rifle modified for full automatic fire as well as semiautomatic, a new VT fuse and several types of new mortars. A jeep became a part of a new unit completed by a launcher of 4.5-in. rockets. There was also shown the latest high-power anti-aircraft weapon, the multiple gun motor carriage T-77, mounting six .50-calibre machine guns. A new, superheavy tank, the T-28, appeared. This is the heaviest vehicle ever built for the ordnance department. Weighing nearly 100 tons, it mounts a 105-mm. gun and a .50-calibre machine gun, the whole assembly heavily armoured. For aeroplanes, the outstanding new weapon was the 75-mm. automatic gun which gives planes the punch of artillery with machine-gun operation. The new automatic mechanism of this weapon permits a plane to get off several shots in one power dive, an impossibility with the older, hand-loaded gun of the same size. Three recoilless rifles, developed to cut down weight while giving artillery fire power, were shown. These were the 57-mm. rifle fired from the shoulder like a bazooka and the 75-mm. and 105-mm. rifles fired from light-weight tripod mounts.

Experiments indicated that the high-explosive bullets and projectiles used by fighter pilots of World War II might soon be replaced by high-speed metallic jets, travelling at initial speeds of 25,000 ft. per second. These shaped-charge missiles or "bullets" can be supplied in explosive, penetrating, or incendiary types. They should prove especially effective in firing at armoured, guided missile targets.

The second would be the projection of a high-speed jet from a fighter aircraft in lieu of conventional bullets or projectiles. The tremendously high initial velocity of these shaped-charge missiles ameliorates the difficulties associated with deflection and greatly simplifies the requirements for fire-control instruments.

In August announcement was made of a secret guided missile. This was known as "GAPA" (ground-to-air pilotless aircraft). It is a prototype projectile, pencil slim, ten-foot long guided missile. When ultimately perfected, it was expected to be capable of seeking out and destroying possible weapons before they could register on their targets.

Testing began in May at White Sands, N.M., of captured German V-2 rockets. These tests made it possible to study not only the trajectory and ballistics of the rockets but also to gain information concerning the physics of the upper atmosphere. Radar equipment, adapted to tracking the rockets to a height of 100 mi., along with other special electronic equipment, was used during the tests. Firing of the V-2 rockets was begun at White Sands on May 10; in November one was fired to attempt to learn the secrets of the ionosphere. The rocket was provided with instruments located in its war head to record the properties of the upper air and to provide data on the reflection and refraction of radio waves in the ionosphere. Skin temperature of the missile, which in flight rose to a height of 63.5 mi., was also recorded. By the use of special radio equipment, newly developed, it was determined that only very high frequency radio waves could penetrate the ionized layers while those of lower frequencies were reflected back to the earth's surface as light is reflected by a mirror.

Along with experimentation with V-2 rockets went intensive scientific study of cosmic rays, considered an elementary form of solar energy. Army air forces sought especially to determine

the effect of cosmic rays on various chemicals and metals used in the development and assembly of guided missiles. One of the first things learned was that a radio set with clear reception and long range on the ground goes completely haywire when carried to the high altitudes necessary to a proper consideration of cosmic rays. Cosmic ray investigation led, of course, to a study of mesons. These are described as particles of energy which form part of the breakup of the cosmic ray in the earth's atmosphere. The most energetic of the mesons are rated as 100 million million times as powerful as the particles released by the atom bomb and it was doubtful if they could ever be harnessed.

In the field of general equipment and munitions, interest centred on testing of army items in cold weather climates. Three task forces, totalling 4,500 men and called task forces Frigid, Frost and Williaw respectively, carried out months of testing in Alaskan weather. Some of the new items tested were: clothing lined with fibre-glass to repel cold; nylon tents and portable squad shelters which can be pitched on any terrain without using any poles, ropes or stakes; a reversed refrigerator with a heating element to thaw 4,000 lb. of solidly frozen food and in 24 hr. raise it to a temperature of 128° F.; a new type of knife, fork and spoon, made of stainless steel and designed to be nested compactly to fit in a uniform pocket; a new type of nontoxic heat tablet, known as trioxane and capable of heating a pound of water in still air to 100° F.

During 1946 the army adopted a new ration, "E," containing a variety of meat items, canned bread which keeps well in all climates, confections and other food accessories, superior to the old "C" and "K" rations of World War II. A new water-purifying tablet was perfected and found to be preferable to the former chlorine type. Using iodine rather than chlorine, drinking water produced is less objectionable in taste and odour.

The army effected a 68% reduction in volume of spare parts for materials-handling equipment. This had already made possible a 33% saving in warehouse space and a 40% saving in time required for selection and packing.

New type parachutes, fitted to be used when dropping from supersonic aircraft, were tested.

The realm of applied science produced at least two interesting developments. One of the most modern high-altitude chambers in the world was built at Cornell university research laboratory. The chamber is 34 ft. long with an inside diameter of 10 ft. Its refrigeration and pressure system is so designed that pressure altitudes of more than 67,000 ft. and temperatures as low as -85° F. can be simulated. At Picatinny arsenal, a 20,000,000-volt betatron unit was installed for the examination of artillery shells and bombs. This X-ray machine can "look" through 12 in. of steel and detect cavitations or other imperfections.

The army made two unusual civilian contacts during the year. "Goop," wartime incendiary filling for bombs, was regarded after hostilities as a substance without commercial value or use. However, it was being presented in huge quantities to the United States forest service where it proved a valuable agent, simply handled, in the building of backfires to fight the menace of forest fires. Smoke generators used in World War II were lent to agriculture department experimental stations to be used in fruit, cotton, tobacco and wheat belts to protect crops from frost and insects.

A few more of the outstanding munitions developments of the year are listed briefly.

"Jato" units to assist aeroplane take-offs were successfully tested during 1946. Four such rocket motor units were installed under the wing of a Douglas C-54 "Skymaster" which then took off after a ground run of less than 700 ft., whereas the normal ground run is 3,000 ft. Each rocket unit, using the rapid expansion of heated gases to provide its thrust, produced 333 h.p. at

90 m.p.h. for approximately 12 sec.

Clothing known as "inverted fish bowl" pressure suits were developed for stratosphere flying, enabling air crew members to reach 62,000 ft. altitude in comfort. The suit resembles a deep-sea diver's suit, plus a large goldfish bowl, and is capable of counteracting the loss of external pressure in near-stratospheric heights.

In August the air forces tested its largest land-based bomber, the Consolidated XB-36. It is 163 ft. long, has a wing-span of 230 ft. and a rudder height of 47 ft. 6 in. It is powered by six 3,000 h.p. Pratt and Whitney engines mounted on the trailing edge of the wing, 3 on each side of the fuselage. Each engine drives a three-bladed pusher-type propeller. The XB-36 has a bomb-carrying capacity of more than 30 tons.

Lycoming division of Aviation corporation at Williamsport, Pa., perfected the world's most powerful reciprocating aircraft engine. This engine, the Lycoming XR-7755, develops 5,000 h.p. at take-off; this is the power equivalent to that produced by a modern railway locomotive. The engine, to be known as X-7, has 36 cylinders in 4 banks of 9 each and combines high-power output necessary for take-off with low fuel consumption necessary for range.

The Army Epidemiological board announced in May the development of an effective vaccine against dengue fever. Mice were used in the testing.

Lightweight airborne radar equipment was used for the first time on a scheduled transport operation when a C-54 plane flew from Westover Field, Mass., to Paris, France, during May. Some of the contributions to flight safety of this lightweight radar are:

(1) The ability to "see" turbulence and storm conditions on the flight path and therefore to avoid them.

(2) By using radar beacons, there was provided a method of accurate, short-range position fixing.

(3) An anti-collision device effective during instrument and night flying.

(4) An obstruction warning device for the avoidance of mountains and other terrestrial obstructions.

(5) An aid to navigation under instrument conditions for location of islands, shore lines, rivers, lakes, cities and other landmarks.

A telephone switchboard weighing only 2½ lb. was developed. Seven of these units together with a standard army field telephone are sufficient to handle the same traffic as a regular six-line switchboard which ordinarily weighs 60 lb.

Navy.—The navy's material activities during 1946 fall under three categories: first, demobilization; second, disposal of surplus and third, research and development. In demobilization it was essential to preserve for future use entire ships and items of modern armament for future installation on merchant ships or converted vessels. A notable advance lay in the preparation of materials for long-term storage, including dehumidifying systems in ships and the enclosing of certain fixed equipment aboard ships and certain items, particularly ordnance, in storage ashore in a plastic film sprayed on with a conventional paint spray gun. These measures, and hermetically sealed metal enclosures for certain types of mounts, made it possible to lay up ships so that they might be returned to service with a minimum of time.

The disposal of surplus property had, of course, to be preceded by a determination of what was surplus, which required a close examination of all material to determine obsolescence. There was retained only modern equipment suitable for future use and laid away in condition for immediate reissue. A considerable quantity of obsolete naval equipment had to be scrapped

Above: SELF-PROPELLED 240 MM. HOWITZER weighing 63 tons, displayed early in 1946 during the Artillery conference at Fort Sill, Okla. Its top speed is 20 m.p.h. Carrying its crew of 18 men, the weapon can be put into action three minutes after pulling into position

Left: CARBINE FITTED "SNIPERSCOPE," a U.S. army weapon revealed in 1946. The device permits the user to see in total darkness through a telescope (above the gun) an enemy who is revealed by a beam of infra-red light, which is sent out by the projector (below), although the light is invisible to the enemy

Below: JET BOMB (JB-3), shown attached to the wing of a bomber, is launched when the mother plane is flying at 300 m.p.h. and is controlled during initial stages by the operator in the bomber; then a special device in the nose of the bomb guides it to the target

Below: GERMAN WORKERS in protective clothing at a U.S. army chemical warfare service depot in Germany, in 1946, where they were destroying German toxic bombs

AD-1 SKYRAIDER, a new carrier-borne plane of the U.S. navy, revealed in 1946, was built by Douglas. It carries two 12-inch "Tiny Tim" rockets and twelve 5-inch rockets, giving it, according to Douglas, "an explosive wallop more destructive than the guns of a light cruiser." The "Tiny Tim" rocket was also revealed in 1946, and was said to be "by far the deadliest thing ever fired from an aeroplane"

before disposal to retain the confidential status of the equipment itself and of some of its components.

Research and development in naval munitions during World War II had two distinct objectives: the immediate solution of pressing problems and the solution of obviously long-range problems through the application of new and improved scientific techniques. In early 1946 the material bureaus eliminated practically all of the problems for which interim solutions had been sought because shrinking funds and the urgent civilian need for scientific and engineering talent dictated concentration on projects offering greatest promise. Improvements in conventional weapons were pursued only if they offered substantial improvements. Outstanding developments in this field were: (1) The 8-in. rapid fire mount. Fully mechanized handling of ammunition and substantially completely automatic operation promised a marked increase in rate of fire over the conventional 8-in. gun.

(2) The development of the 6-in. .47-calibre gun, of proven effectiveness in night cruiser engagements and shore bombardments, into a double purpose weapon for use against ships and aircraft. Again mechanized handling of ammunition substantially increased the rate of fire.

(3) The old 3-in. .50-calibre anti-aircraft gun, a relatively fast-firing hand-loaded weapon with hand operation of elevation and train, became an automatically loaded gun mounted in pairs on power-driven mounts and controlled by electronic directors embodying radar. Utilizing the VT (proximity) fuse, the combination provides a tremendous increase in anti-aircraft effectiveness at approximately the weight of a 40-mm. quadruple mount.

(G. F. HY.)

Air.—A guided missile is a space-traversing weapon or missile intended to make a single journey to a target. The term guided means that the missile is equipped with some kind of controlling or guiding agent. This agent may be carried within the missile, such as a homing device activated by the target itself, like heat, light, sound or metal, or an automatic pilot set prior to launching. The guiding agent may be external, exerting control by wire from a parent plane or by a radar-radio system. A pilotless aircraft is simply a guided missile whose aerodynamic surfaces are sufficiently large to furnish its chief support in flight, such as the V-1 buzz bomb. The National Advisory

Committee for Aeronautics (N.A.C.A.) had a far-reaching program to provide basic research data for use in the design and operation of guided missiles to be developed by the army and navy. In its laboratories and testing grounds at Langley field, Va., Cleveland and Moffett field, Calif., problems relating to aerodynamics—shape of airfoils, wings, fins, etc., for supersonic speeds; propulsion—rockets, ramjets, pulse jets, etc.; control and stability—electronics, gyros, infra-red, television, etc.—and launching—from ground, ship or plane—and other problems were being tackled. N.A.C.A. developed five special research missiles, RM-1, RM-3 and RM-5 for stability and control, and RM-2 and RM-4 for airfoil and drag research. Late in 1946 N.A.C.A. also announced the "Tiamat" (named for an Assyrian-Babylonian goddess), one of the first successful step rockets, launched by a rocket booster which drops off after 3 sec. and the research missile, equipped with telemetering devices to transmit to ground a record of its flight, continues on its way for 45 sec., powered by a small internal rocket engine.

Army and air force guided missiles were designed for operation from ground-to-air, from air-to-air, from air-to-ground and from ground-to-ground. They had to be capable of reaching tremendous speeds and altitudes, and military authorities were already thinking in terms of outer space as a possible battleground of the future. Army ordnance (White Sands, N.M. and Aberdeen), the signal corps and the army ground forces all had programs under way in this field.

In the autumn of 1946 the U.S. war department assigned to the army air forces full responsibility for research and development in guided winged missiles. Five main fields were being covered: aerodynamics and design, propulsion, guidance and control, war heads, launching methods and equipment. More than 100 universities and aircraft, electronic, chemical, automotive and other industrial companies were conducting active research in these problems. Over-all direction was at AAF headquarters with a guided missiles section attached to A-4, Materiel. Design and development in the field was under the Pilotless Aircraft branch, Air Materiel command, Wright field, Dayton, O. Flight test activities were carried on at the AAF Guided Missiles Proving ground, Wendover field, Utah, while operational testing and training was conducted by the First Experimental Guided Missiles group, Elgin field, Fla. Activities at Wendover during 1946 included testing of new electronic control devices, development of equipment and training of pilots in remote-controlled B-17 drone operations and testing the Boeing developed "GAPA," a supersonic rocket interceptor intended to seek out and destroy enemy high-speed, high-altitude aircraft or missiles. The long range B-29's were also being adapted as remote controlled pilotless aircraft, as perfection of rockets with sufficient range and accuracy was admittedly several years away.

Guided missiles and pilotless aircraft used by naval forces involve problems and requirements that differ fundamentally from those of air forces. The U.S. navy organized its air munitions into four tactical classes: (1) Those launched from ship-to-air for protection against attacks by enemy aeroplanes or guided missiles; (2) ship-to-ship, strictly an attack function; (3) air-to-surface pilotless aircraft launched from parent planes against enemy ships; (4) ship-to-shore missiles designed to pound land targets from the sea, to support amphibious operations, etc. During 1946 navy's Project Bumblebee under the Guided Missiles section, bureau of ordnance, made considerable progress in rockets, ramjets and guided missiles, with projects in scores of universities, industrial laboratories and private companies. (See AVIATION, MILITARY.) (N. F. S.)

Rockets.¹—A great amount of information, released for public consumption in many countries, clearly demonstrated a univer-

¹ Published with permission of the chief scientist, ministry of supply, U.K.

sal and rapidly increasing growth of interest in rocket technique during 1946. The emphasis everywhere was on long-range, guided missiles; the shorter-range compact rockets, used so successfully during World War II as aircraft armament and mass-barrage weapons, were temporarily neglected.

The installation at Westcott aerodrome, near Aylesbury, Buckinghamshire, of a large experimental establishment for guided projectile research under William R. Cook was deplored by local farmers and landowners, but they were overruled by the cabinet and constructional work continued. Reported estimates of the cost were £2,000,000. In October rumours that the project was to be abandoned were officially denied.

A technical mission under the charge of Lieut. Gen. J. F. Evetts left England for Australia in April to explore the practicability of employing large tracts of wasteland and desert there, for rocket-firing trials. Reports published after the return of the mission indicated the approval by Sir Alwyn Crow, director of guided projectiles, of recommendations for the use of a site near Mount Eba, South Australia, as the base, firing in a northwesterly direction, eventually over Port Hedland and Broome, 1,200 mi. away. The cost was variously estimated as between £10,000,000 and £20,000,000. A near-by Australian ordnance establishment was proposed as an assembly factory.

Reports during July and August from several European countries, particularly Scandinavia, of unexplained rocket missiles repeatedly passing over, and frequently exploding overhead, were at first generally regarded as proof of long-range rocket activity by soviet union scientists but later explained by Karl Manne Siegbahn, Swedish physicist and Nobel prize winner, as meteorites. Soviet scientists were reported by many correspondents, however, as actively pursuing rocket research and development, using German scientists alongside their own.

At White Sands, N.M., U.S. scientists fired V-2 rockets, assembled largely from parts recovered in Germany, to heights of more than 100 mi., creating new altitude records. Recording and telemetering instruments, carried in the war head compartment, gave them valuable new data concerning many meteorological problems. Other guided missiles, developed at the California Institute of Technology at Pasadena, were successfully fired and demonstrated the remarkable rate of technical progress in rockets achieved in the U.S.A.

Many reports originating from authoritative sources disclosed optimistic views on the future feasibility of bridging the Atlantic by mail-carrying rockets and of reaching speeds of 25,000 m.p.h. by rocket propulsion, which would suffice to enable a device to leave the earth's gravitational field.

Sir Alwyn Crow, for several years head of rocket research and development in Britain, went to Washington, D.C., in December, to direct the scientific and technical services of the British Supply office, a move indicative of the large share envisaged for rockets in future technical liaison between Britain and the U.S.A. (See also ATOMIC ENERGY; NAVIES OF THE WORLD.)

Murray, Philip (1886–), U.S. labour leader. A native of Scotland, he was born in Blantyre on May 25 and emigrated to the United States in 1902. Naturalized in 1911, he became a member of the international board of the United Mine Workers of America the next year, president of the union's fifth district in 1916, and international vice-president in 1920. Murray succeeded John L. Lewis as president of the Congress of Industrial Organizations (C.I.O.) on Nov. 22, 1940, when Lewis fulfilled his pledge to quit if Roosevelt were re-elected. But Murray did not follow Lewis in his bitter opposition to Roosevelt's foreign policy. A split developed in May 1942, when Lewis ousted Murray as U.M.W.A. vice-president. Mur-

ray fought back, and the C.I.O. went along with him; Lewis and the mine workers walked out. During World War II Murray fought to maintain the no-strike policy, to use manpower more efficiently, to streamline the War Labor board, to stabilize prices, etc. Immediately following conclusion of World War II, the C.I.O., under Murray's guidance, launched its campaign for continued high wages and better working conditions. On Jan. 23, 1946, two days after the steelworkers went out on strike, Murray launched a sharp attack on corporation tax laws, charging that if the steel industry did not operate another day in 1946, it would regain \$149,000,000 in tax rebates, representing an amount 29% above the level of the industry's prewar earnings; he asked Secretary of the Treasury Fred Vinson to take steps to end this "outrageous condition." He assailed President Truman's handling of both the rail strike in May and the coal strike in November-December. Murray was also concerned over the communist issue in 1946 and at the C.I.O. convention in Atlantic City, he was given authority by the executive board (Nov. 15) to expel communists from the union. At the latter convention (Nov. 22), he was re-elected by acclamation to his seventh year as C.I.O. president.

Museums of Art: see ART GALLERIES AND ART MUSEUMS.

Music. German power and propaganda having vanished from the globe, a remarkable cultural renaissance began in the liberated countries of the European continent. Everywhere new life, new voices appeared, new ambitions and new courage developed. Native U.S. composers, conductors and instrumentalists were welcomed in Russia, England, Italy, Austria and Czechoslovakia, reversing thus the picture of prewar days. A new brotherhood through music was in evidence, and the United States had assumed the leadership. Some of the foreign-born musicians who had made their homes in the U.S. during World War II returned to their respective countries to be helpful in the reconstruction of cultural organizations and institutions. International music festivals and meetings took place in many of the European capitals. The London festivities of the International Society for Contemporary Music brought together in happy reunion an unusually large number of creative musicians from both sides of the Atlantic. Among the works performed were: Sergei Prokofiev's *Ode to the End of War*, Anton von Webern's *Cantata*, Belá Bartók's *Concerto for Orchestra*, Arnold Schoenberg's *Ode to Napoleon*, Igor Stravinsky's *Sonata for Two Pianos*, Paul Hindemith's *E flat Quartet*, Ernst Křenek's *Quartet No. 7*. The younger generation complained about the absence of works written by composers under the age of 30. Another London festival featured Frederick Delius in seven concerts conducted by Sir Thomas Beecham. A sensational success was achieved by Benjamin Britten's second opera *The Rape of Lucretia* at Glyndebourne, England. Lucerne, Switzerland, offered two symphony concerts by Arturo Toscanini for the benefit of La Scala. The International Festival weeks, later on, featured programs conducted by French, English, Italian, Swiss and Austrian masters of the baton in co-operation with world famous soloists. Salzburg, Austria, attempted a somewhat modest revival.

The Ninth Festival of Contemporary Music in Venice discovered many new creative talents. The I.S.C.M. in Rome offered well-known and new works of many nationalities. The outstanding world-première was *Don Quixote* by Goffredo Petrassi, a spiritual concerto for two voices and nine instruments. Politically and culturally important music events occurred in Moscow where entire programs of U.S. music were given on July 4th (observing the national holiday) and 5th. Roy Harris' *Ode to Friendship* was surrounded by works of Aaron Copland,

FIRST NIGHT performance of Mozart's opera "Don Giovanni," which opened the Salzburg Festivals on Aug. 1, 1946, at Salzburg, Austria, birthplace of Mozart. The annual music fest was interrupted by the war, but was held in 1946 with the active assistance of the U.S. forces in Austria

Samuel Barber, George Gershwin, George Antheil, Wallingford Riegger, Elie Siegmeister, etc. Yehudi Menuhin's six-day visit to Moscow matched the arrival in the U.S. of Ukrainian opera singers. England, France, the U.S.S.R. and the U.S. were represented at the Prague festival. Czech music celebrated its national reawakening with works by Harris (*Third Symphony*), Barber (*Second Essay*), William Schuman (*American Festival Overture*). Copland (*Salon Mexico*), Leonard Bernstein (*Jeremiah Symphony* and *Violin Sonata*) were performed along with piano concerti by John Ireland and Aram Khachaturian, Arthur Honegger's *Symphony for Strings* and Britten's four "Interludes" from *Peter Grimes*. Aloys Haba's quarter-tone music was again in evidence. The enthusiastic welcome was given the Czech philharmonic in Zurich (*Fourth Symphony* by Bohuslav Martinu under young Jeronym Kubelik) and the visit of the Amsterdam Concert Gebouw orchestra to the Interlaken, Switzerland, festival. Three new works of the aged Richard Strauss: *Metamorphosen* (for orchestra), an oboe concerto with small orchestra and the *Second Sonatina* for 16 wind instruments had their world premières during the annual music weeks in Zurich. Among the new important works by Swiss composers performed on the same occasion and in first presentation were Honegger's *Symphonic Liturgique* and his *Symphony for strings*, Othmar Schoeck's *Summernight* and *Suite in A flat*, both for string orchestra. Heinrich Sutermeister's opera *Niobe* had its first hearing at the state opera house in Berlin and was immediately accepted for performance in Dresden, Basel and Zurich.

At Tanglewood in the Berkshire hills, Mass., Serge Koussevitzky offered the first U.S. presentation of Britten's *Peter Grimes* as well as the U.S. première of Dmitri Shostakovich's *Ninth Symphony* under his direction. Other works performed and worthy to be mentioned were Arthur Loulié's *Naissance de la Beauté* and G. Francesco Malipiero's *Le sette Auegnesse l'Amore*. The annual glorification festivities of native U.S. music in Rochester, N.Y., under the sponsorship of Howard Hanson included 40 works by 30 different composers many of whom were newcomers. First performances to be cited were: Weldon Hart's *First Symphony*, Bernhard Rogers' *To the Memory of President Roosevelt* and shorter works by Robert Palmer and Wayne Barlow. A new organization "The Fellowship of American Composers" (under the guidance of Roy Harris) met in Detroit and gave reading rehearsals to young composers and awards to contest winners. Yaddo, N.Y., the meeting place of

the young set featured many new names on its six programs. At the Saratoga Spa festival a concertino for piano and orchestra by Frederick Jacobi and the *Symphonic Elegy* by Křenek attracted attention. These waves of novelties were tempered by the Ninth Festival of Old Music (six concerts) at Williamsburg, Va., under the direction of Ralph Kirkpatrick.

The friendly exchange of artists and musical works between nations was bound to bring about a better understanding of national temperaments and culture in general. Belgium was the first European country to mobilize its youth for cultural unity. "Les jeunesses musicales de Belgique" found an immediate echo in France. These latin "Youth Societies" expressed the desire to hear much music and to encourage the new native creative talent. Their membership went quickly into the thousands. In Paris the music life took a quick up-turn with both opera houses and the several symphonic organizations reaching prewar status of activities. The "Prix de Rome" was again given after all the years of German occupation. In all the capitals of Europe the local branches of the I.S.C.M. began their reorganization. In Milan, young musicians formed "La Bottega dei compositori" for the exchange of new ideas and for the presentation of new works. Geneva, Switzerland, held its international contest for singers, pianists and other instrumentalists as well as for string quartets. A goodly number of outstandingly talented young artists were discovered. Vienna reported its slow recovery in the musical doings. News from Poland was surprisingly encouraging. Activities in two opera houses and at least five conservatories of music were successfully resumed. Musicians organized for mutual help and for national recognition. The Netherlands seemed to have been the first of the occupied countries to have fully recovered its music-life. Palestine indicated the birth of a Jewish music. Synagogical prayers and folk songs were brought in by refugees from Poland, the Ukraine and Spain. Mexico city featured a busy midyear season under the leadership of Carlos Chavez; Hindemith, Darius Milhaud and Stravinsky conducted their own works.

In the international picture the following newcomers among composers must be mentioned: Olivier Messiaen, Elsa Barraine (both French), Robert de Roos (Dutch), Franz Mohaupt (German), Roman Palester (Polish), Alan Rawsthorne (English) and Albert Moeschinger (Swiss).

Many symphonic writers contributed to the band literature as a new outlet for their ambitions and inspiration (Milhaud, Barber, Shuman, Henry Cowell, Harris, Paul Creston, Stravinsky). Edwin Goldman presented Schoenberg's *Variations* for band and many other similar novelties at Central Park, N.Y., before large audiences. Commissions to seasoned composers

were generously given by broadcasting stations, symphony orchestras, foundations, artists and private individuals, all over the U.S. Music was written for government films, and Hollywood continued to snare both "serious" composers and "box office" artists into the movie world. An avalanche of books about music, its creators and interpreters flooded the market. Two important contributions were *The Schillinger System of Musical Composition*, a new approach to create music, by Joseph Schillinger, and Messiaen's *Technique de mon langage musical* (not translated into English as yet). Formerly well-known music periodicals were revived in France and England and a number of new ones made their appearance stressing the voice of the younger generation.

During the greatly increased symphonic activities in the U.S. some important world premières attracted attention: Copland (*Third Symphony*), Harris (*Celebration Variations*), Milhaud (*Second Symphony*), Stravinsky (*Symphony in Three Movements*), Bartók (*Third Piano Concerto*), Ernest Bloch (*Suite Symphonique*), Hindemith (*Herodiade*), Prokofiev (*Summer Day*), Barber and Vladimir Dukelsky (*Cello Concerti*), Gian-Carlo Menotti (*Piano Concerto*), Creston (*Fron-tiers*). (R. Gz.)

Popular Music.—The year 1946 had its encouraging features in the field of America's popular music. Public taste gave recognition to a number of songs that were definitely above the average, while the end of World War II put an abrupt stop to the abortive attempts at "patriotic" and "martially significant" music. Composers and publishers were content to express old ideas, with an occasional twist of novelty, and Tin Pan Alley dismissed all feelings of national responsibility with a distinct sigh of relief.

The songwriter of the year was unquestionably that established pillar of popularity, Irving Berlin, returning with fresh enthusiasm to his customary success, after a long period of loyal service to his country. His musical comedy, *Annie Get Your Gun*, starring Ethel Merman in a tuneful version of the life of Buffalo Bill's sharp-shooting Annie Oakley, became an immediate Broadway sensation, under the managerial direction of Richard Rodgers and Oscar Hammerstein II. All records were broken when three songs from that production appeared simultaneously for five successive weeks on radio's Hit Parade. These three were "They Say It's Wonderful," possibly the best song of the year, "Doin' What Comes Naturally," a down-to-earth suggestion of uninhibited folk-music, and "I Got the Sun in the Morning," with a smartly rhythmized message of optimism. Berlin was also responsible for the motion picture *Blue Skies*, containing a wealth of his music, interpreted by Bing Crosby and Fred Astaire, and including a new hit, "You Keep Coming Back Like a Song." At the close of the year, "White Christmas" gave its annual reminder of enduring popularity.

The commercial hit of 1946, however, was a curiously old-fashioned song called "The Gypsy," whose exact appeal it is impossible to analyze. It appeared in the Hit Parade for 20 weeks in succession, eight times at the top, and it was admittedly the year's biggest seller of sheet-music and records.

There were other songs whose popularity was not easily explained (except through the astute merchandizing methods of their publishers). The rather obscure names of Bennie Benjamin and George Weiss appeared on three big hits, with the titles "Oh! What It Seemed to Be," "Rumors are Flying" and "Surrender." The Burke-Van Heusen team scored with the slightly suggestive "Personality" and the inoffensive "Aren't You Glad You're You?" but also published "Ole Buttermilk Sky," the latest hit by Hoagy ("Stardust") Carmichael, who came back with still another novelty, "Doctor, Lawyer, Indian Chief,"

besides appearing successfully in that outstanding film, *The Best Years of Our Lives*.

Sammy Cahn and Jule Styne collaborated effectively in the sprightly "Five Minutes More," as well as "Let It Snow!," "It's Been a Long, Long Time" and "The Things We Did Last Summer." Paramount's "To Each His Own," placed second to "The Gypsy" in *Billboard's* popularity poll, profited by motion picture publicity and the title's vague suggestion of moralizing.

The French importation, "Symphony" (originally "C'est fini"), held its own for several months as a holdover from 1945, topping the Hit Parade seven times in the early weeks of 1946. Other good tunes of the year were "South America, Take It Away," by Harold Rome (from the musical hit, *Call Me Mister*), the Kern-Hammerstein "All Through the Day" (appearing in the film, *Centennial Summer*) and "The Old Lamp-lighter," by Charles Tobias and Nat Simon.

"Shoo-Fly Pie and Apple Pan Dowdy" echoed the tune of "Casey Jones," while "I Can't Begin to Tell You" owed something to "When Love is Young in Springtime." Frederick Chopin's melody encouraged a revival of "I'm Always Chasing Rainbows," credited to Harry Fox instead of Harry Carroll in the *Dolly Sisters* film, and the commonplace measures of "Laughing on the Outside" brought more than 20 complaints of plagiarism.

The serious composer of the year was probably Sergei Rachmaninoff, chiefly by way of his *Second Piano Concerto*, which was used in half a dozen motion pictures, besides supplying the tunes for "Full Moon and Empty Arms" and other popular songs. Peter Tschaikovsky and Edvard Grieg also continued to find a new public, and there was no lack of interest in the solid work of Richard Rodgers and Cole Porter (the latter being honoured with a film biography, *Night and Day*).

Billboard's poll selected Dinah Shore and Perry Como as top vocalists in the popular field, with Frankie Carle heading the band-leaders. (S. Sp.)

Music in Industry.—Music for the worker became increasingly popular throughout 1946. There was a large sale of equipment to plants operating their own musical programs, and a great increase in the number of outlets for wired music services.

Extensive research continued to reveal new factors for the betterment of musical programs. Mental workers need a type of program different from that provided for those under physical stress. Still another type of subdued musical program is needed for office workers whose tasks entail concentration.

There was a notable increase of installations for banks, mostly to benefit the workers, but not without consideration of the patrons. Department stores using wired music multiplied. Most of these confined their outlets to the work areas, although some stores catered also to patrons.

Study of the workers' reactions brought new statistical information with resulting betterment of service. In the needlework industry for example, instead of midmorning and midafternoon programs formerly used to anticipate the usual fatigue periods, it was found desirable to supply half hourly programs of brief duration.

In line with music in industry is its use in therapy. It was stated that music in waiting rooms is a time saver for the doctor, who is not obliged as formerly, to relax his patient already soothed by well-designed musical programs.

The solution of the problem of music for workers in noisy operations was regarded as of prime importance, because the fatigue factor is so closely linked to the din of such work. (See also RADIO.) (X.)

Recordings.—With the gradual release of materials previously restricted by wartime needs and the increase in industrial capacities and manpower, the producing companies were hard put to it to meet a demand, which was urged by a number of factors, but principally by the huge new buying public developed during World War II.

In the United States, largest source of supply, it was believed at first that there would be, oddly enough, a great over-production. But this belief resulted from the unanticipated shortage of record players, a situation, influenced by both scarcity of materials and the considerable number of strikes, which was eventually remedied. The 1946 totals attained in overall production by RCA Victor, Columbia, Decca, Capitol and many other firms was much beyond that of the industry's best year, 1921.

In England, HMV, English Columbia, English Decca, Polydor and other groups—all having trade agreements and exchange affiliations with

U.S. houses—channelled the bulk of their production for export.

In Italy, the Cetra company released its first postwar recordings—principally operatic and concert works—almost exclusively for the U.S. market.

The significant developments along the lines of fidelity reproduction were to be observed in the F.F.R.R. (full frequency range recordings) of the Decca company of London, and the pressings made on vinyl plastic by RCA Victor in the United States.

F.F.R.R., a perfected automatic recording technique, dispensed with monitoring, that is to say, the necessity for human control of the quality and volume of sound in the recording studio. In addition, the frequency range was much extended, thus permitting reproduction of all the fundamental frequencies and overtones audible to the ear, thereby enhancing the variety and quality of musical expression.

The vinyl recordings of RCA Victor, (climaxing 11 years of research), besides permitting greater clarity and reducing surface noise to a minimum, had the advantage of being unbreakable and, therefore, more enduring. In 1946 a number of such recordings were issued, although the first had been released in Oct. 1945 (Richard Strauss's *Till Eulenspiegel's Merry Pranks*, performed by the Boston symphony orchestra under the direction of Serge Koussevitzky). However, the extreme scarcity of the plastic, which was still under government control in 1946 did not warrant a wide production, although it was expected that it would increase materially with the curtailment of restrictions. Nash, Paul (1889–1946), British painter, was born on May 11 in London. A well-known post-impressionist painter, Nash first achieved prominence for his war pictures made while he was attached to the Artists' Rifles in France during World War I. He worked in many mediums—oil, water colour and wood engraving—and in the industrial field designed textiles, wood, glass, china, books and posters. During World War II, he organized the Arts bureau in Oxford for war service and was attached to the air ministry and to the ministry of information as official artist. He was the author of several publications on art and decoration and on British artists; his latest work was *Penguin Modern Painters* #4 (1946). See *Encyclopædia Britannica*. He died on July 11, according to a London report.

National Association of Evangelicals. This inter-church organization in the United States, formed in May 1943 to provide a means of co-operation in fields of common interest for conservative Protestant churches, added five denominations during 1946 to its constituency, giving it a membership of approximately 1,300,000. Its associated organization, the Evangelical Foreign Missions association, served 64 mission boards. Another associate, the National Sunday School association, launched a new International Sunday School lesson series and inaugurated a system of Sunday school conventions in various states. Its radio department was incorporated as the National Religious Broadcasters. Its Commission on War Relief was operating in 12 countries. The value of food and clothing sent to Europe and the orient up to the end of 1946 was in excess of \$8,000,000. An office of transportation and supply was opened in New York during 1946 for the purpose of providing equipment of all kinds and transportation to and from mission fields for its constituents. A regional office was established in Minneapolis, bringing the total number of offices to 12. The officers elected at its annual meeting held in May 1946, in Minneapolis, were Dr. R. L. Decker, of Kansas City, Mo., president; Dr. Stephen W. Paine, of Houghton, N.Y., first vice-

president; Dr. William H. Rutgers, of Grand Rapids, Mich., second vice-president; Seth A. Rohrer, of Elkhart, Ind., secretary; H. J. Taylor, of Chicago, Ill., treasurer. Dr. J. Elwin Wright was continued as executive secretary. (J. E. Wt.)

National Education Association of the United States thru its representative assembly meeting in Buffalo, N.Y., July 5, 1946, adopted a Victory Action Program (1946-51) providing for the unification, expansion and development of local, state and national professional associations of teachers along with a 21 point program of action for the improvement of education. The association was working for a nation-wide minimum salary of \$2,400 annually for beginning teachers with a bachelor's degree plus annual increments running up to at least \$5,000. The association continued its pioneering work on behalf of the United Nations and the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.). It was host at Endicott, N.Y., Aug. 17-30, 1946, to a world conference which drafted a constitution and took steps to establish a representative World Organization of the Teaching Profession. The association also sponsored the National Emergency Conference on Teacher Preparation and Supply at Chautauqua, N.Y., in June. The association's federal aid proposal as embodied in S. 181, amended, continued to make progress and was favourably reported to the senate by its committee on education and labour. "Education for the Atomic Age" was the theme for American Education week, Nov. 10-16, 1946. Among new publications issued by the association during the year were the *N.E.A. Manual for Locals* and the United Nations edition of the *American Citizens Handbook*. The association was organized in Philadelphia in 1857. It had in 1946 a membership of 340,973 and its affiliated state associations had a membership of 759,980. Its official organ is *The Journal of the N.E.A.*, edited by Joy Elmer Morgan, and issued to all members monthly except June, July and August. The president for 1946-47 was Pearl A. Wanamaker, state superintendent of public instruction, Olympia, Wash.; executive secretary, Willard E. Givens. (See also EDUCATION.) (J. E. Mo.)

National Geographic Society. Organized in 1888 by a small group of professional geographers in Washington, D.C., the society had for its aim, as stated in its charter, the "increase and diffusion of geographic knowledge." Gilbert Grosvenor, president in 1946, assumed the direction of the organization's activities in 1899.

With the idea of interesting a much larger group of intelligent laymen by presenting the less technical and more human aspects of geography, he transformed the society's journal into the handsomely illustrated *National Geographic Magazine* of today. The membership of the society, which was less than 1,000 in 1899, was 1,500,000 in 1946.

The society relies chiefly on its magazine to fulfill its purpose to diffuse geographic knowledge. In carrying on its activities for the increase of geographic knowledge the society, in the 58 years of its existence, sent out more than 100 scientific expeditions to all parts of the earth.

To measure the invisible rain of cosmic rays through the earth's atmosphere the National Geographic society, in co-operation with the U.S. army air forces and the Bartol Research foundation of the Franklin institute, conducted during the summer of 1946 a series of flights totalling approximately 50,000 mi. The investigations were made in a converted B-29 bomber which was flown at altitudes ranging from 5,000 to 35,000 ft. The course extended over 70° of latitude from southern Canada to northern Chile. The plane carried cosmic ray detecting apparatus which made automatic records of the incoming rays showing how they vary with both latitude and altitude. Reports were to be made following a study of the records.

Completing eight years of archaeological investigations in southern Mexico, the joint expedition of the society and the Smithsonian institution, under the leadership of Dr. Matthew W. Stirling, spent the early months of 1946 in excavating the site of an ancient ceremonial centre near the village of San Lorenzo, Veracruz state. This was the third centre of the civilization known as the "La Venta Culture" unearthed by the series of expeditions. Indications are that the culture there reached its highest development. Five gigantic human heads carved from basalt, massive decorated altars and monuments, as well as small ceremonial art objects were uncovered, all showing superior workmanship. It is estimated that the centre flourished between A.D. 500 and 800. The correlation of art forms and pottery types points to the probability that the La Venta culture was a forerunner of much of the culture of the Mayas, the Toltecs and the Aztecs.

The aurora studies of the society in co-operation with Cornell university, directed by Dr. C. W. Gartlein, were continued during 1946 from the headquarters of the project at Ithaca, N.Y. Photographs and measurements made during the year included the outstanding displays of the nights of Feb. 7-8, March 23-24 and July 26-27. An unusually large sun spot which appeared during the latter aurora gave evidence by radio and magnetic effects that particles causing the effects journey from sun to earth in about 27 hours.

Further researches were carried on during the year by the society's expedition for the study of North American birds under the leadership of Dr. Arthur A. Allen of Cornell university. Natural colour photographs were made in bird refuges along the coasts of North and South Carolina, and in Georgia, Florida, Texas, northern Mexico and the Rocky mountains of the United States.

The society's cartographic division in 1946 designed, drew and published four ten-colour wall maps which were issued as supplements to the *National Geographic Magazine*. In all more than 6,000,000 copies of the charts were distributed to the society's members. The map of the northern hemisphere showed a region of special interest to civil aviation following the development of intercontinental air routes during World War II. It contained tables of airline distances, many of them extending over the Arctic regions. The postwar map of the United States embodied data from the most recent aerial and surface

surveys and included new communities such as Oak Ridge, Tenn., which came into existence as a result of war activities. The map of India and Burma, together with the previously issued charts of other portions of Asia, completes the society's current mapping of the earth's greatest continent. The map and the supplemental chart on its reverse side showed 598 political subdivisions of the British provinces and native states of India. The map of the Bible lands, centred near Palestine, included most of the countries of the Arab league, as well as Turkey, parts of Iran and sections of Bulgaria and Greece.

The National Geographic society's headquarters are at 1146 Sixteenth Street, N.W., Washington 6, D.C. Officers in 1946: president and editor, Gilbert Grosvenor; vice-president and associate editor, John Oliver La Gorce; secretary, Thomas W. McKnew; and treasurer, Robert V. Fleming. (G. GR.)

National Guard. When most military groups were consolidating and reducing their activities the national guard of the United States was reorganizing. The National Defense act provides that following a period of federal service all individuals and units of the national guard revert to their states. Provision for the post World War II reorganization was also included in the National Defense act, and in 1946 under these provisions reorganization of the new national guard, to be 682,000 strong, was started.

There was prepared by the war department general staff committee on national guard policy and approved by the secretary of war on Oct. 13, 1945, a set of war department policies relating to the postwar national guard, which made considerable changes in its character, composition and mission of the future as compared with that of the past.

Based upon these policies, the national guard bureau, a division of the war department special staff, prepared a phased plan for the reorganization of the national guard, which was approved on Jan. 28, 1946. The national guard bureau also prepared an allocation of national guard units appearing on the approved war department national guard troop basis and apportioned men among the several states. Letters went to the various states early in February offering them these troops for allotment. Acceptance of these allotments and later adjustments in them in accordance with the provisions of the National Defense act provided the underlying broad authority for the reorganization of the national guard.

The primary mission of the national guard is that of an "M-day force" to supplement the regular army in the defense of the United States in the event of any future declaration of war by an outlaw nation. The national guard provides the organized units: equipped, trained and available for immediate service in any climate, under any combat condition whether defensive or offensive. Secondly, the national guard is a state force which, under the direction of the individual governor, provides the state with local security strength and provides disaster relief if needed.

The major difference between the national guard and other civilian components of the military establishment is that it is authorized by law to receive pay and equipment from the federal government, that it is fully organized and equipped on regulation tables of organization and equipment, that it employs an age-in-grade policy for officers, that it maintains training programs on the same level with the regular army, that its personnel must meet physical and professional requirements identical to regular army standards and that it is at all times ready for instant mobilization.

The national guard is a joint responsibility between the federal government and the states, and the chief of the national guard bureau is the war department's representative to work

with the adjutant generals of the states and territories, etc., the military representatives of their respective governors, on this two-way contract for the benefit of all concerned.

Postwar planning for the reorganization of the national guard was begun before the cessation of hostilities. Studies were begun by the national guard bureau and the war department in 1944 incorporating the changes in weapons of warfare brought about by scientific and technical research and development, the increase of population within the United States and the similarity between the situations toward the end of World Wars I and II.

The results of these studies was an over-all troop basis considered to be a balanced force distributed throughout the United States. Original figures were increased until the number was approximately 620,000 officers and enlisted men in the national guard ground force units, approximately 60,000 in the national guard air units and 4,000 in state headquarters detachments.

The national guard is organized into divisions, wings, regiments, squadrons and other units like the regular army. The units in each army and air force area come under the army area and air force commander in time of peace, and automatically become a part of his command when they are first ordered into active military service of the United States in case of national emergency.

The first step in the reorganization of the national guard was the allotment of the troops to the various states and territories. This was followed by the acceptance of these allotments, with such adjustments as were necessary, by the states and territories.

In accordance with the provisions of National Guard Regulation No. 15 and the fact that federal law limits the troops that can be raised by the various states, it was further necessary that when the states were ready to proceed, the chief of the national guard bureau send to the governors thereof formal authority to organize each of the specific units already allotted and accepted.

By the end of 1946, 6,314 units had been accepted by the states and territories. At the beginning of 1947 about one-half of these units had been authorized to organize and the number of units federally recognized (which means they had met the initial requirements and passed inspection by a team representing the commanding general of the field army or numbered air force concerned) was mounting rapidly. All must stand inspection for federal recognition within 60 days after they are authorized to organize.

It was expected that 72,000 national guard officers and men would be ready for field training in 1947 and that about 240,000 would be enrolled by mid-year.

National Labor Relations Board.

More cases were filed with this independent agency in the fiscal year 1946 than in any year after the National Labor Relations act was passed. A total of 12,260 cases was brought to the board's attention, an increase of 26% over the number filed in the previous year. However, since nearly half of these cases were docketed during the last four months of the fiscal period, the receipt of new cases was really 50% greater than for the comparable period in the previous year.

Of the 12,260 cases docketed in the fiscal year, 8,445, or 69%, involved representation questions and 3,815, or 31%, charges of unfair labour practices. Although this proportion is not markedly divergent from that of the previous year, 75% to 25%, it represents a noteworthy departure from a trend. After

1941 the proportion of unfair labour practice cases to representation cases steadily declined; the shift in proportion thus constitutes a break in an uninterrupted decline of five years' duration.

On July 1, 1945, the board had on its docket 1,916 representation cases—*i.e.*, cases concerned with petitions filed by employers or employees requesting board investigation and determination of units and freely-chosen representatives for purposes of collective bargaining. With the filing of 8,445 new election cases, the board's preoccupation with a total of 10,361 such cases reached an all-time high. During the year it closed 7,981 of these cases leaving a balance of 2,380 on its docket July 1, 1946.

Most of the above cases were closed by board-conducted elections or cross-checks of company pay rolls with union authorization cards. The remaining cases closed were either withdrawn by the parties filing the petitions or dismissed by the board for lack of merit.

During the year the board conducted 5,589 elections in which 698,000 employees cast secret ballots for the organization of their choice. In 4,446 balloting, or nearly 83% of the polls held, an organization was selected by at least a majority of the employees and thereupon was certified by the board as collective bargaining representative.

Only 1,163, or 20.8%, of the elections held during the year were ordered by the board. The greater number of them, 3,685, or 66%, were held with the consent or agreed-upon stipulation of all parties. The remaining 163 polls were prehearing elections, the result of a new board policy instituted in Nov. 1945 to expedite the disposition of reconversion representation issues. This policy makes it possible for elections to be conducted in certain types of cases without awaiting a formal direction of election by the board in Washington; any necessary hearing may be held after the conduct of the election.

Affiliates of the American Federation of Labor were successful in attaining majority designation in 2,004 polls, receiving 175,332 votes; unaffiliated unions scored in 484 instances and received 90,874 votes; and in the remaining 1,143 contests there were 168,965 ballots cast against union affiliation.

From July 1935 through June 30, 1946, the board conducted nearly 30,000 elections and cross-checks. The importance of self-determination to the individual worker is demonstrated by the consistently high percentage of employees who actually cast ballots. Nearly 7,000,000 workers, or 83% of those eligible to vote, went to the polls and, by secret ballot, signified their choice of bargaining representative. About 84% marked their ballots in favour of a representative.

The board carried over from its previous year 1,321 unfair labour practice cases. With the 3,815 new such charges filed during the year, the total to be handled was 5,136. Of these, 2,909 cases were closed in the fiscal period, leaving a balance of 2,227 unfair labour charges pending on its docket July 1, 1946.

Section 8 of the act specifies those unfair acts of employers which deny, abridge or interfere with the employees' right to bargain collectively. Under this section, employers are specifically prohibited from interfering with, restraining or coercing employees in the exercise of their rights to organize and bargain collectively; dominating or interfering with the formation of any labour organization; discriminating against any employee to discourage or encourage membership in a labour organization; discharging or otherwise discriminating against an employee because he has filed charges or given testimony under the act; and, lastly, employers are prohibited from refusing to bargain with the representatives selected by a majority of employees in an appropriate bargaining unit.

C. K. BERRYMAN of the *Washington Evening Star* refers in this cartoon to a ruling of the N.L.R.B. in the Jones & Laughlin Steel Corp. case in March 1946, that foremen had the right to join production workers' unions

As in the past, the most frequent allegation of unfair labour practice in such cases filed in the fiscal period involved discriminatory treatment because of union activity. This was alleged in 64% of such cases docketed. Next in frequency was the allegation of employer refusal or failure to bargain in good faith. This allegation was made in 32% of the charges filed.

Approximately 72% of the 2,909 unfair labour practice cases disposed of during the year were closed by withdrawal or dismissal. To remedy the unfair labour practices found to have been committed in the remaining 793 cases the board obtained the reinstatement of 3,184 workers found to have been discriminatorily discharged. Another 384 employees were directed to be reinstated after strikes caused by unfair labour practices. Back pay amounting to \$899,297 was awarded to a total of 2,779 workers found to have suffered discrimination. Company dominated unions were ordered disestablished in 51 cases. Notices of compliance with board decisions and orders were directed to be posted in 529 cases. Employers were directed to bargain collectively with employee-designated representatives in 175 cases.

From July 1935 through June 30, 1946, the board had ordered the reinstatement of more than 300,000 workers, some with back pay. These back pay awards totalled nearly \$11,000,000. In all, approximately 2,000 company unions had been disestablished. In 5,000 cases collective bargaining was ordered. In 7,200 cases notices of compliance with board decisions were directed to be posted.

The board's jurisdiction extends only to those industries engaged in or affecting interstate commerce. In its 11 years of operation approximately 90,000 cases had been filed by labour organizations, employers and individual workers of the continental United States, Alaska, Hawaii and Puerto Rico. As was the experience in previous years, most of the cases docketed in the 1946 fiscal period involved manufacturing enterprises. A total of 9,227, or 75.3% of all those filed, concerned such companies. Mining, agriculture, forestry and fishing plants were involved in 484 cases; construction, wholesale and retail trade and insurance companies accounted for 1,061; the remaining 443 cases involved transportation, communication and other public utilities.

While the board has its headquarters in Washington, D.C., it maintains 22 regional offices, each responsible for servicing a particular area. The greatest number of cases brought to the

board's attention during 1946 originated in the New York area; the lowest number of cases were filed in Puerto Rico. With the exception of that office, there occurred an increase in the number of representation and complaint cases filed in all of the regional offices. The biggest increase over the previous year was noted in the Indianapolis and San Francisco offices, 103.4% and 62% respectively.

Decisions and orders of the board are not self-enforceable. Either the company or the board may petition the circuit court of appeals. Beyond this, either party may appeal to the supreme court. More than 600 board decisions had been litigated in the federal courts from the time the act was passed. In the circuit courts, 346 of these board orders were enforced in full; 73 were set aside; and 167 modified. Of the 52 cases that reached the supreme court, board orders were enforced in 48 cases; in only 2 cases were board orders set aside.

The board began its 1947 fiscal period with a backlog of 4,607 cases pending on its books, the greatest carry-over in the history of board operations. Alongside this, a cut made in the board's appropriation for the new fiscal year necessitated the discharge of 23% of the board's personnel. The board estimated that the current rate of intake of cases plus the immensity of the backlog, aggravated by the reduction in personnel, might mean the doubling of the amount of time normally required to process cases. Meanwhile, until congress had had an opportunity to consider the board's request for appropriate fiscal relief so that it could perform its statutory duties promptly and efficiently, the board publicly expressed the hope that labour organizations would be patient and not return to the self-help of strikes which the act was designed to discourage. (See also *LABOUR UNIONS; LAW; STRIKES AND LOCK-OUTS.*) (P. M. Hg.)

National Mediation Board. The National Mediation board, established in 1934 by amendment of the Railway Labor Act of 1926, is an independent agency of the U.S. government, functioning to adjust employee-representation and collective-bargaining disputes affecting employees of interstate common-carrier railroads and air lines.

In 1946, the most noteworthy railway problems requiring the board's good offices involved the nation-wide wage and rules disputes. After the breakdown of bargaining between the bulk of the railroad industry, represented by three regional conference committees, and the carriers' employees, represented by 20 "standard" railway labour organizations, the Mediation board attempted unsuccessfully to obtain settlements through mediation but persuaded all parties, except the trainmen's and engineers' brotherhoods, to submit the wage-increase issue to arbitration. Following a vote by the two remaining unions to resort to strike action, the Mediation board advised the president of the prospective interruption of interstate commerce, and the president appointed an emergency fact-finding board to recommend a basis for settlement. The emergency board's recommendations of a 16-cent hourly increase, similar to the arbitration award applying to the other 18 unions, plus several changes in working rules, were unsatisfactory to the engineers and trainmen, who engaged in a two-day paralyzing strike late in May. Presidential intervention resulted in a revised settlement, affecting all 20 unions, based upon an aggregate wage increase of 18½ cents. Further negotiations, mediated settlements and recommendations of emergency boards resulted in application of the "concerted wage movement" to all remaining railroads, save a few small, independent carriers found by an emergency board to be on the economic margin.

In the air-transport industry, the Mediation board's services were largely concerned with determination of appropriate "craft or class" groupings of employees and certification of such groups' choices of unions to represent them in collective bargaining. Collective bargaining and mediation were notably productive of voluntary agreements, the most spectacular exception being a wage and rules dispute between the Air Line Pilots association and Transcontinental and Western Air, Inc. A strike which grounded the air line for a month in late 1946, following the pilots' rejection of the recommendations of an emergency board, was ended when the chairman of the Mediation board induced the parties to arbitrate.

Altogether, the board received 450 cases and disposed of 526, of which 186 were representation disputes and 340 were wage or rules disputes. Emergency boards appointed under the Railway Labor act numbered 14.

National Railway Labor Panel.—Under authority of a presidential executive order supplementing the Railway Labor act for the period of wartime emergency, the chairman of the panel, in 11 instances, appointed three-man emergency boards from the panel's membership to recommend settlement of disputes wherein no strike action was threatened. The panel chairman's responsibility for reviewing railroad and air line wage adjustments under wage-stabilization standards was exercised in 346 submitted cases; additionally, the chairman issued three general wage-approval orders prior to termination of the wage stabilization program on Nov. 9, 1946. National Museum: see SMITHSONIAN INSTITUTION.

National Parks and Monuments. The year 1946, the 30th anniversary year of the national park service, was highlighted in the U.S. by record-breaking travel to the national parks, national monuments and other units of the national park system. It was also a year marked by reconversion of visitor facilities and services throughout the system to a normal peacetime level.

Visitors to the national park system during the 1946 travel year (ended Sept. 30) totalled 21,682,782, approximately 632,000 more than during the previous record travel year of 1941, the last before the outbreak of World War II. This heavy travel taxed concession facilities to the limit. In some areas visitors who arrived during weekend or holiday periods without advance reservations were obliged to seek accommodations elsewhere, and in a few of the heavily travelled parks the length of stay of visitors had to be limited.

Interest in the national parks and other units of the national park system was not confined to citizens of the United States. Officials of a number of foreign governments toured these areas to obtain first hand information concerning their development, administration and maintenance, or wrote to the national park service for information. In the roster of foreign visitors were several Frenchmen who made an extensive tour of western national parks and wildlife refuges to study their management with a view to possible application of U.S. practices to natural areas in French colonial possessions. Another foreign visitor who came to the United States in search of facts concerning park administration was Dr. Huan-kang Fu, a Chinese forester who managed Sun Yat-sen memorial park over a period of years.

Among major developments of the year 1946 was the designation by Secretary of the Interior J. A. Krug of the Adams mansion in Quincy, Mass., home of Presidents John Adams and John Quincy Adams and of other illustrious members of the Adams family, as a national historic site. This site is in federal ownership and administered as a unit of the national park

INTERIOR of Touro synagogue, Newport, R.I., which was designated a national historic site on March 5, 1946. This structure was said to be one of the finest surviving examples of colonial architecture in the U.S.

system. Secretary of the Interior Krug also designated Touro synagogue in Newport, R.I., one of the finest surviving examples of colonial religious architecture in the United States, as a national historic site. Being privately owned, however, this site is not part of the national park system.

Santa Rosa Island national monument, Florida, a unit of the system from 1939, was abolished by act of congress and its lands turned over to Escambia county, Fla. By another act of congress, Custer Battlefield national cemetery, Mont., was designated a national monument.

By the close of 1946, the national park system included 169 units, classified as follows: 27 national parks, 4 national historical parks, 85 national monuments, 11 national military parks, 1 national battlefield park, 7 national battlefield sites, 11 national historic sites, 9 national memorials, 10 national cemeteries, 3 national parkways and the system of national capital parks.

During the year four of these areas received widespread press and radio publicity on the occasion of their formal dedication to public use. The home of Franklin D. Roosevelt, national historic site, Hyde Park, N.Y., was dedicated on April 12, first anniversary of the death of President Roosevelt; Olympic national park, Washington, a wilderness region famed for its alpine scenery, virgin forests and rare Roosevelt elk, was dedicated on June 15; and Isle Royale national park, Michigan, and Mammoth Cave national park, Kentucky, were dedicated on Aug. 27 and Sept. 18, respectively.

At the suggestion of the national park service, Secretary of the Interior Krug late in 1946 appointed a concessions advisory group, nominated by leading nation-wide organizations, to make an exhaustive and impartial study of hotel, restaurant, transportation and other concessions operations in the national park system. Members of this advisory group were George D. Smith, general manager of the Mark Hopkins hotel, San Francisco; Clem W. Collins of the Denver accounting firm of Collins, Peabody and Schmitz; Elmer Jenkins, national travel director for the American Automobile association; and C. G. Woodbury of Washington, D.C., a director of the National Parks association and the Wilderness society.

National Railway Labor Panel: *see* NATIONAL MEDIATION BOARD.

National Wage Stabilization Board. The National Wage Stabilization board administered, during the postwar reconversion period, the wage provisions of the United States government's price-wage-materials stabilization program. The board's operations extended over the period from Dec. 1945, when it was established by executive order of the president, to Dec. 1946, when its functions were terminated by the order liquidating practically all of the government's stabilization agencies.

The board was set up as a successor to the National War Labor board and was, like that wartime agency, "tripartite" in organization. Two of its six members represented the public, two industry, and two labour. The members were appointed by the president, upon recommendation of the various groups of representatives who made up the War Labor Board. The Wage Stabilization board was administratively part of the department of labour, but was specifically made independent of the department with respect to its policies, decisions, procedures and personnel.

The functions of the Wage Stabilization board differed significantly, however, from those exercised by the War Labor board, particularly in that they included no participation, with one exception, in the settlement of labour "disputes." The exception had to do with cases where the government had "seized" certain operations, the Stabilization board retaining the power under the War Labour Disputes act to order any changes in the terms and conditions of employment in the seized plants. Subject to this exception, the board's operations were confined to the consideration of "voluntary" or agreed upon wage adjustments.

The board administered, in connection with this stabilization function, powers conferred upon the president by the Stabilization Act of 1942, an act which provided for the exercise of broad executive discretion and delegation of authority. The executive orders which established the standards and procedures for the reconversion wage policy were issued on Aug. 18, 1945, and Feb. 14, 1946. These were implemented by regulations issued by the director of economic stabilization, to whose directives the Stabilization board was subject in all matters relating to broad policy.

The wage controls provided for by these orders and regulations did not include the wartime provision whereunder no wage adjustments could be made except as they were approved in advance by the government acting through the War Labor board. The reconversion controls provided instead that *any* wage increase could be made by any employer, irrespective of its amount. The only control maintained was the "indirect" control effected by the provision that a wage increase could not be used by the employer as a basis for seeking an increase in the price ceiling on his product or as a basis for increasing "costs" charged on a government contract, except to the extent it was approved by the Wage Stabilization board. The only exception to this rule permitting wage increases to be made without government approval was in the building and construction industry, where the "direct" wartime controls were retained until Nov. 1946.

The wartime prohibition of unapproved wage *decreases* was continued during the reconversion period and was applicable throughout all industry.

The standards which were applied by the board to determine the approvability of wage increases, permitting their use for price relief purposes, were established by executive order 9651. They provided, in general, for the disapproval of only those

increases which would have contributed to a "second round" of reconversion wage increases. The executive order recognized the fact of the general wage movement which had taken place in a substantial part of U.S. industry during the first six months after V-J day.

The board processed approximately 1,200 wage approval applications each week. It also handled, during 1946, some 25,000 enforcement cases, involving alleged violations of the wartime War Labor board regulations, of the postwar provisions covering the building and construction industry, or of the provisions prohibiting unapproved wage decreases.

The board carried on its operations with a staff of some 700 people. Twelve regional offices were maintained in population centers throughout the country, each of them headed up by a tripartite board whose decisions were final except for a right of appeal to the national board itself. The program in the building and construction industry was administered by the Wage Adjustment board in Washington, from which there was also a right of appeal to the Wage Stabilization board. Jurisdiction over adjustments in salaries exceeding \$5,000 per year and in certain types of executive and professional salaries was vested in the salary stabilization unit of the treasury department, operating independently of the board.

The Wage Stabilization board's operations were effective in whatever measure the broader reconversion stabilization program would be considered to have achieved its purpose. The adoption of "indirect" wage controls made this program simply an adjunct of the price control system. The wage-price "bulge" in the winter of 1945-46 and the legislative bulge in the following summer were a rejection by the country of the principle of postwar stabilization by government. The degree to which these bulges may themselves have been in part a consequence of the V-J day abandonment of strict wartime wage controls will remain an insoluble question, much more complex than it may appear. The Wage Stabilization board was committed by these developments however, along with the OPA and the CPA, to an obligation only to administer the removal of wartime controls in such manner that the withdrawal would not itself contribute to the danger of postwar economic hypertrophy. It is a conservative judgment that this narrow obligation was fully carried out. (W. W. Wz.)

Naval Academy, U.S. The United States Naval Academy, located at Annapolis, Maryland, was founded in 1845, and is maintained by the government, under the immediate supervision of the bureau of naval personnel of the navy department, for the training of young men for the naval service.

The Naval Academy discontinued the wartime three-year course of instruction and resumed the four-year course beginning with the academic year 1945-46. The program for the training of limited numbers of reserve midshipmen which had been in effect throughout the war years was discontinued late in 1945.

In Dec. 1945 the navy department authorized the establishment of a department of aviation in addition to the existing departments of instruction. The major portion of the instruction time allotted for this department is assigned during the summer months. The instruction in the department of avia-

tion is not intended to include actual pilot qualifications but is designed to equip all midshipmen with those fundamentals of aviation which every naval officer should know.

In the summer of 1946 the second class (class of 1948-B) was the initial class to receive instruction in this new department and in addition to recitation and practical work accomplished at the Naval academy this class was also assigned a five weeks' practice cruise in the carrier "Randolph." In company with the second class of the U.S. Military academy, the class of 1948-B also participated in a period of amphibious invasion training under actual combat conditions. The year 1946 also saw the inauguration of other steps looking toward closer co-operation between the Naval and Military academies in the accomplishment of their assigned objectives.

The first and third classes of midshipmen were sent on practice cruises aboard the battleships "Washington" and "North Carolina" which carried them on operations from the North Atlantic to the Caribbean.

In the postwar curriculum of the Naval academy the effort was to be made to renew emphasis upon fundamentals which would result in some curtailment of time previously devoted to highly specialized phases of instruction more properly the subject of postgraduate training. (For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

(R. S. CR.)

Navies of the World. As the outcome of World War II, the balance of sea power at the end of 1946 was vastly different from what it had been in 1939. Only two first-class navies, those of the United States and the British empire, had survived the struggle without serious reduction in strength. The fleets of Germany and Japan had ceased to exist; those of France and the U.S.S.R. had suffered considerable losses which it had not proved possible to make good in their entirety; and the Italian navy was reduced to a shadow of what it had been.

Development of warship design and of naval weapons and equipment was greatly stimulated by the war. In particular, the value of the aircraft carrier was enhanced to an extent that placed it on a par with that of the battleship. This was a natural consequence of improved methods of attack on vessels from the air, in the technique of which the Allied navies had ultimately excelled their opponents. On the other hand, defense against air attack had been correspondingly improved; as many as 100 to 150 anti-aircraft weapons of 40 mm. and 20 mm. were mounted in some U.S. and British battleships.

Most far-reaching of World War II developments was radar, the effect of which was to transform the whole face of naval warfare. It enabled searchlights to be dispensed with almost entirely. In gunnery, great improvements in accuracy resulted from its application to fire control. Navigational hazards were materially reduced by the employment of radar, and the approach of aircraft could be detected by its aid.

Improvements in the efficiency and deadliness of torpedoes, mines and antisubmarine depth charges also resulted from war experience. In some instances these improvements were the result in the first place of enemy ingenuity, but the products of the Allies' efforts ultimately outstripped those of their adversaries. In the design of submarines alone did the Germans retain their lead up to the last, all their resources being ultimately concentrated in this field.

Various novel types of ships inspired by wartime needs included the escort aircraft carrier, the destroyer-escort or frigate, the corvette and landing ships and landing craft of multifarious kinds. Not all of these were likely to survive under peace conditions, but for some years the principal navies would probably

include not only escort carriers, destroyer-escorts and frigates, but also a certain percentage of the more useful types of landing craft.

It was in landing craft that a formidable new weapon, the rocket, was first used as a main armament. There was no doubt that rockets possessed great potentialities, since they were capable of producing a relatively immense volume of fire without absorbing weight and space to the extent that a corresponding armament of guns would require. It was expected that experiments would be attempted with large warships armed with rockets. Completion of certain ships of the U.S. navy was understood to have been deferred with this especial purpose in view.

United States Naval Strength.—In the course of 1946 a great many obsolescent or redundant ships were struck from the list of the U.S. navy. As constituted at the end of 1946 it comprised 17 battleships, with an 18th, the "Kentucky," in the completing stage. Delivery of this ship was to be held up for 12 months in order to provide for modification in armament, to include a proportion of rocket projectors. Only ten of the completed battleships were of modern design; two of the remaining seven were probably to be discarded. There were also 2 battle cruisers, with a third, the "Hawaii," held up for alteration in armament on similar lines to the "Kentucky"; 27 fleet aircraft carriers, with 2 more building; 79 escort carriers; 26 heavy cruisers (4 more building); 46 light cruisers (2 more building); 364 destroyers; 296 destroyer-escorts; and 200 submarines, with numerous minelayers, minesweepers, patrol vessels and auxiliaries of various kinds, the totals of which were still in process of reduction in 1946. An increased number of the larger ships were laid up in reserve during 1946, so that only two battleships, "Iowa" and "Missouri," would be retained in full commission, the former in the Pacific and the latter in the Atlantic fleet. The exact proportions of the active fleets, ready reserve and laid-up reserve were thus undergoing some modification.

Future provision was being made for a total personnel of 558,000 officers and men in the U.S. navy and 107,000 in the U.S. marine corps, with reserves amounting to 198,352.

British Naval Strength.—At the end of 1946 the strength of the royal navy included 13 battleships and 1 battle cruiser. Of these only 5 battleships were of modern design, and 2 were in full commission. Three were commissioned with special complements for training purposes, 4 were relegated to harbour service as accommodation ships with reduced armaments, and the remainder were either laid up in reserve or under refit. There were 12 fleet aircraft carriers and 2 of the escort type, with 12 more of the former under construction. Another carrier was lent to the French navy for five years. Cruisers numbered 50, of which 6 were earmarked for sale; 4 others were under

Above: AIRCRAFT warming up for a take off from the snow-covered U.S.S. "Midway" flight deck during "Operations Frostbite," the subarctic cruise in March 1946 undertaken to test the carrier and its gear and equipment

Left: SPRAYING a thin film of plastic over a 40 mm. gun mount on a U.S. navy vessel, which was decommissioned in 1946, to protect it from rusting while the ship was idle and to preserve it for future use

Below: JAPANESE SUBMARINES anchored at Sasebo, Japan, in 1946 were a few of the remains of the once powerful Imperial Japanese navy

Below: H.M.S. "VANGUARD" (foreground), Britain's newest and mightiest battleship, was commissioned on May 13, 1946. In the background the "Queen Elizabeth," world's largest liner, was being refitted after wartime service

construction. Other vessels included 182 destroyers; 97 submarines; 3 minelayers; 44 sloops; 122 frigates; 60 corvettes; 194 fleet minesweepers; 3 monitors; 2 netlayers; and a large number of coastal craft, trawlers and auxiliaries of all kinds. Four battleships of the "Lion" type, on order at the beginning of the war, were ultimately cancelled, as was a substantial proportion of the wartime construction program. In the above figures are incorporated the naval forces of the dominions, the strength of which was also reduced materially during 1946.

British naval personnel in 1946 amounted to 492,800, exclusive of dominion forces.

France.—In 1946 the French navy consisted of 3 battleships (1 under completion, 1 in commission and 1 employed as a gunnery training ship); 1 fleet carrier (lent for five years from Britain) and 1 of escort type; 9 cruisers and a 10th building; 28 destroyers and large torpedo boats; 12 destroyer-escorts and frigates; 12 submarines (4 more building); 4 sloops; 7 corvettes; 13 fleet minesweepers (3 more building); and various auxiliaries. Personnel in 1946 totalled about 60,000.

Italy.—Under the terms of the peace treaty, the Italian navy was reduced to 2 battleships, 4 cruisers, 20 destroyers and large torpedo boats, 20 corvettes, and such minor war vessels and auxiliaries as could be manned and maintained in full commission by a maximum of 2,500 officers and men. The entire personnel of the navy, excluding any naval air personnel, was limited to 22,500 officers and men. Excess units of the Italian navy were to be placed at the disposal of the governments of the United States, the British empire, the U.S.S.R. and France, except in the case of certain surface vessels and submarines, which were directed to be sunk, scrapped or otherwise destroyed. It was further provided by the treaty that no battleship, aircraft carrier, submarine, motor torpedo boat or specialized assault craft should be constructed, acquired, employed or experimented with by Italy. Total standard displacement of war vessels other than battleships was not to exceed 67,500 tons.

During the period of minesweeping because of the war Italy was authorized to employ for this purpose additional officers and men not to exceed 2,500 in number.

U.S.S.R.—Though official information concerning the soviet navy was almost nonexistent, it was believed to include 3 battleships, 8 cruisers, 50 destroyers and large torpedo boats, 100 submarines and considerable flotillas of coastal craft, patrol vessels, minesweepers, etc.

Other European Countries.—In the Royal Netherlands navy were 1 escort aircraft carrier; 2 cruisers (with 2 more building); 6 destroyers; 7 submarines; 3 sloops; 1 frigate; 12 fleet minesweepers; and sundry minor war vessels and auxiliaries.

In the Royal Norwegian navy were 7 destroyers, with an eighth under construction; 5 torpedo boats; 5 submarines; 3 corvettes; 2 fleet minesweepers; and various minor vessels. Personnel numbered 7,500 officers and men.

Denmark possessed 2 destroyers (completing); 3 torpedo boats, with 6 more building; 2 submarines; 2 frigates; 1 corvette; 1 minelayer; and sundry small minesweepers, coastal craft and auxiliaries. Personnel numbered 4,000.

Sweden had 2 cruisers (with 2 more building); 7 coast defense ships; 27 destroyers and large torpedo boats; 26 submarines; 2 minelayers, and numerous minesweepers, patrol craft, etc. Two large destroyers were nearing completion. Personnel totalled about 10,000.

Finland had 1 coast defense ship, 5 submarines and a number of small craft such as minesweepers, etc.

Poland had 2 destroyers, 4 submarines and a number of minesweepers and coastal craft.

Spain possessed 6 cruisers, 16 destroyers, 7 sloops, 6 minelayers and 7 fleet minesweepers, besides minor vessels and

auxiliaries. Under construction or on order were 20 destroyers, 4 sloops and some smaller craft.

Portugal had 5 destroyers, about to be modernized; 3 submarines; and 6 sloops, with various ancillary vessels.

Turkey had 1 old battle cruiser; 8 destroyers; 10 submarines; 2 obsolete cruisers used for training; and sundry other ships.

In the Royal Hellenic navy were 7 destroyers, 6 submarines, 4 corvettes and various smaller craft. It was hoped that a cruiser would also be acquired.

Rumania had 2 destroyers, 1 submarine, 1 minelayer and some other craft of less importance, including a river flotilla on the Danube. Bulgaria had only a few small craft of little fighting value. In the Yugoslav navy were 1 submarine, 2 corvettes and some unimportant small craft. A destroyer laid down before the war might still have existed in 1946, but no appreciable progress appeared to have been made with its construction.

South and Central America.—In the Argentine navy at the end of 1946 were 2 old battleships, 3 cruisers, 11 destroyers, 3 submarines, 2 coast defense ships and a number of minesweepers, patrol vessels and auxiliaries. A new program of construction envisaged the building or acquisition of 1 aircraft carrier, 1 cruiser, 4 destroyers, 3 submarines, and some minor vessels, largely in replacement of obsolete tonnage.

Brazil had 2 old battleships, 1 cruiser, 12 destroyers, 4 submarines, 6 corvettes and some smaller craft. Six destroyers were under construction at Rio.

Chile possessed 1 battleship, 1 cruiser, 6 destroyers, 7 submarines, 1 sloop, 3 frigates, 3 corvettes and some other vessels. A new program of naval construction was being prepared.

Other South and Central American states maintained navies of relatively small importance. Peru had 2 cruisers, 2 destroyers and 4 submarines; Colombia, 2 destroyers; Mexico, 3 sloops; Cuba, 2 sloops; Uruguay, 1 sloop; Honduras, 1 frigate; Dominican Republic, 1 frigate and 1 corvette; Costa Rica, Nicaragua, Haiti and Panama, 1 or 2 small craft each.

Asia.—China was busily engaged in renewing its depleted naval strength, additional vessels being acquired from the United States, Britain and France, together with one or two ex-Japanese ships. In 1946 future strength was expected to be 3 or 4 cruisers, 5 destroyers, 2 submarines, with flotillas of minesweepers, patrol vessels and river craft.

The Siamese navy included 4 coast defense ships, 1 old destroyer, 3 submarines, 2 sloops and some smaller vessels, though the condition of some was reported to be doubtful. Two cruisers which were building in Italy were expected to be scrapped.

Iran and Iraq each possessed a few small craft of negligible fighting value. Manchurian naval vessels were believed to have fallen into soviet hands. (See also MUNITIONS OF WAR.)

Nebraska. One of the states formed from the territory of the Louisiana Purchase, Nebraska lies in the lower Missouri valley in the west north central part of the U.S.; admitted to the union in 1867; land area, 76,653 sq.mi.; water area, 584 sq.mi.; pop. (1940) 1,315,834; capital, Lincoln (81,984). In 1940, 39% of the pop. was urban. About 1% of the total pop. is Negro and about 8% foreign-born, principally German and Scandinavian. On July 1, 1945, the bureau of the census estimated the state's pop. as 1,198,492.

History.—Val Peterson, Republican, was elected governor

Nov. 5, 1946, for the term 1947-49. Other state officers for 1947-49 were: lieutenant governor, Robert B. Crosby; auditor, Ray C. Johnson; secretary of state, Frank Marsh; treasurer, Edward Gillette; state superintendent of public instruction, Wayne O. Reed; chief justice, Robert G. Simmons. The legislature consists of a single house of 43 members chosen biennially on a nonpartisan ballot.

The legislature of 1945 enacted laws providing for more liberal unemployment benefits, introducing retirement

systems for municipal and public school employees, adjusting county salaries, setting up machinery for the comprehensive regulation of aviation, and providing for preprimary party conventions for the official endorsement of party candidates. The legislative council, composed of 16 legislators, reported to the legislature of 1947 the results of extensive investigations of electric power, irrigation and water utilization, public school organization and finance, tax assessment practices, municipal finance and the legal status of life insurance companies.

Education.—Elementary and secondary education is largely in the hands of local school districts of which there were nearly 7,000 in 1947, with some supervision from the state superintendent, and with slightly more than \$1,000,000 annual state aid. The total enrolment in elementary and secondary schools in 1945 was 230,666 and the teaching staff numbered 12,183. Expenditures for 1944-45 amounted to \$27,644,106.

Social Insurance and Assistance, Public Welfare and Related Programs.—The state appropriation for public assistance for 1945-47 was \$20,187,000. In July 1946 the number of persons receiving general relief was 2,210 and the amount spent for the year ending June 30, 1946, was \$708,163. At the same time, recipients of aid to dependent children numbered 5,381 and received during 1945-46 \$558,817; 436 blind persons received \$164,986. The state maintained 6 correctional institutions with a total of 1,043 inmates on Jan. 1, 1946, and 10 others for dependents, with a population of 6,644. These 16 institutions were under the supervision of an appointed board of control to which was appropriated \$10,770,926 for 1945-47.

Communication.—The total highway mileage of the state in 1946 was 100,338. Of this 8,860 were in the state system (exclusive of portions in incorporated places) and were maintained by the state. Of this latter figure 3,817 were hard surfaced, 4,805 gravelled and 342 earth. State expenditures for highway purposes in 1945-46 amounted to about \$18,000,000. Federal funds available for highway purposes between Oct. 1, 1945, and June 30, 1947, were estimated in Nov. 1946 as \$16,826,153. In 1946 there were 121 airports in the state, 39 of which were managed by municipalities, in addition to 5 federal auxiliary landing fields. Total railway mileage in the state in 1946 was 6,326. Thirteen radio stations operated in the state in 1946, six of which were located in Omaha and Lincoln.

Banking and Finance.—State banks numbered 282 in 1946 with total assets of \$353,474,542. There were also 46 building and loan associations with assets of \$65,203,121; 133 co-operative credit associations and credit unions with resources of \$11,198,988. The assets of eight trust companies amounted to \$15,062,271. National banks in March 1946 numbered 128 with resources of \$1,011,008,000.

The total assessed valuation of the state as determined in Aug. 1946 was \$2,162,048,610. The tax rate for state purposes was set at 3.3 mills, calculated to produce \$7,134,760. Receipts for the biennium 1943-45 amounted to \$68,325,114, including \$17,358,085 of federal funds. Expenditures were \$61,041,635. Total appropriations for 1945-47 were \$63,105,844, including unexpended balances and the sum of \$3,000,000 set aside for postwar construction, mainly for the state institutions. There was no state tax on personal or corporate incomes or on sales except of motor fuel. The state had no bonded debt, though that of local subdivisions in 1945 amounted to \$57,198,416. This latter figure did not include the indebtedness of the public power districts which supply nearly the entire state. Their debt in 1945 amounted to about \$88,000,000.

Agriculture.—The total acreage harvested in 1946 for the crops listed in

VAL PETERSON, governor of Nebraska, was elected on the Republican ticket, Nov. 5, 1946

the table was 16,009,000. In addition 2,141,000 tons of wild hay were taken from about 900,000 ac. As of Dec. 1, 1946, the total farm income for the year was estimated to run between \$800,000,000 and \$850,000,000, exclusive of government payments, as compared with \$747,992,000 in 1945.

Leading Agricultural Products of Nebraska, 1946 and 1945

Crop	1946*	1945
Corn, bu.	244,156,000	258,304,000
Wheat, bu.	93,579,000	85,212,000
Oats, bu.	68,684,000	74,120,000
Barley, bu.	11,529,000	13,420,000
Potatoes, bu.	11,055,000	12,075,000
Sugar beets, tons.	800,000	635,000
Alfalfa hay, tons.	1,742,000	1,933,000

*Estimated Nov. 13, 1946.

Manufacturing.—Manufacturing is of comparatively minor importance in the economy of the state. Most establishments are engaged in the processing of farm products. No comprehensive figures on manufacturing were available after 1939. In Dec. 1946, however it was estimated that employment by concerns covered by the unemployment compensation laws would total 152,000.

Mineral Production.—Aside from clay, sand, gravel and building stone, most of which is consumed locally, the state has no mineral wealth of consequence. There are deposits of petroleum which were worked after 1939 but total production to the end of 1946 was only a little more than 5,000,000 bbl. (L. W. L.)

Necrology: see OBITUARIES.

Negroes, American. The Armed Services.—The U.S. army announced over-all figures of Negro personnel for the war period as 920,000 men and 7,768 officers; promulgated the Gillem report purporting to aid the better integration of Negroes in all the various branches of the service, but after Negro re-enlistments reached 20%, announced a 10% ceiling quota for Negro army strength and 315 specifically designated reserve corps units for all Negro personnel, assigned, however, to small detachments affiliated with general units. The latter actions were widely protested. Negro fighting units received distinguished unit awards totalling 32 such units, and the 969th field artillery battalion, a mixed unit, received this award for heroic action in the defense of Bastogne during the Battle of the Bulge.

Legal and Political.—Throughout the south, elections showed a heavy increase of Negro voting; Georgia registrants increased by 118,387 alone. Even in Mississippi, despite threats and acts of violence, several hundred Negroes voted and a militant Negro newspaper editor, Percy Greene of the *Jackson Advocate*, joined with white liberals to bring senator-elect Theodore G. Bilbo to trial before a congressional investigating committee for illicit campaign practices, including threats and intimidation of Negro voters, culminating in the postponement of his seating in the 80th congress. In reaction to Negro political participation, Alabama reverted to state convention instead of primaries for candidate nominations and passed by a small margin the Boswell amendment calling for the interpreting before election judges of the constitution as a qualification test for voters. In Georgia, the Negro became the pivotal issue in the state elections which resulted by a narrow margin in the election of Eugene Talmadge as governor; this, too, was largely a reaction from the liberal reforms of the regime of Gov. Ellis G. Arnall. Renewed Ku Klux Klan activities, mass lynchings in Webster county, La., and Monroe, Ga.; and the organization of a new "white supremacy" order, the Columbians, in Atlanta, Ga., indicated serious reaction trends. But these situations were widely protested, south as well as north; extensive Federal Bureau of Investigation inquiries were started, Governor Arnall took steps to outlaw both the K.K.K. and the Columbians and the Klan had its charter revoked in New York, New Jersey and California. Interracial protest meetings, especially one held Sept. 23 at the Lincoln memorial, Wash., D.C., highlighted the Monroe lynching of two Negroes and their wives, but in spite of extensive FBI investigation, a grand jury found insufficient evidence to indict.

The Columbia, Tenn., riot trial attracted nation-wide attention, ending in the acquittal by an all-white jury of 23 of the 25 Negroes charged with murder and inciting to riot. The University of Texas was sued for noncompliance with the Gaines decision, requiring equal educational college and professional facilities, and in June the United States supreme court ruled against racial segregation of passengers in interstate bus travel.

Industrial and Economic.—Massachusetts adopted a Fair Employment Practices committee (F.E.P.C.) law, with similar legislation pending in 12 states. The Congress of Industrial Organizations (C.I.O.) and the American Federation of Labor (A.F. of L.) both announced wide-scale drives to organize labour without race restrictions in the south, and in Norfolk, Va., the U.S. district court ruled that the Brotherhood of Locomotive Engineers and Firemen must not restrict the promotion rights of Negro firemen. The National Urban league announced considerable increase in the upgrading and employment of Negroes as sales and clerical workers in the retail merchandising field and in public utility employment, as a result in part of the direct and indirect influence of F.E.P.C. statutes; in 28 cities public utilities figures jumped from 717 to 2,712.

Educational and Cultural.—Negro college enrolment was 53,030 with 5,264 graduates; Dr. Charles S. Johnson was elected the first Negro president of Fisk university, Nashville, Tenn. Several appointments of Negroes to posts on mixed college faculties, including New York university, Haverford college, and the University of Chicago, brought the total of such appointments to about 50. The Booker Washington bust by Richmond Barthe was dedicated in the American Hall of Fame on May 7. Ralph J. Bunche as acting director of the trusteeship division of United Nations, organized the division and supervised the first trusteeship agreements and the hearings which refused the petition of the Union of South Africa for annexation of its old mandate. William O'Hara Lanier took up his post as U.S. minister to Liberia, and by a gift of \$250,000 from Harvey S. Firestone, an American Foundation for Tropical Medicine was announced for Liberia. Lester Granger was awarded an honorary L.H.D. by Dartmouth college, his alma mater, and the distinguished service medal on nomination of the secretary of the navy for his services as adviser on Negro personnel. It was announced that 12 Negro research scientists had served on the atom bomb research staffs. Mrs. Emma Clarissa Clement was chosen the "American Mother of the Year" by the Golden Rule foundation. In music, Camilla Williams starred successfully in the name role of Madame Butterfly with the New York Center Opera Co., and received a "Page One award" for this achievement, while Carol Brice continued her successful career by a featured appearance at the Berkshire Festival concerts. Canada Lee, after a successful Broadway run with his sponsored problem drama, *On Whitman Avenue*, appeared with the Elisabeth Bergner company in "white-face" as Boscola in Webster's *The Duchess of Malfi*. The race discriminatory policy of several Washington, D.C. theatres was extensively challenged locally and nationally, with the result that 30 of the leading U.S. playwrights signed a ban on any Washington performances of their plays until the restrictions were lifted. Actor's *Equity* also passed condemnatory resolutions. Shirley Graham won the Julian Messner award for the best book fostering democratic relations with her biography of Frederick Douglass, *There Once Was a Slave*. The Federal Council of Churches of Christ in America in Columbus, O., convention, adopted strong resolutions against segregation in the armed forces, in residence areas and churches. (See also LYNCHING.)

Nehru, Jawaharlal (1889–), Indian statesman, historian and writer, was born on Nov. 14 at Allahabad of a distinguished Hindu family. For his early career, see *Encyclopædia Britannica*. Next to Gandhi, Nehru is regarded as the most influential of Indian nationalist leaders. After the outbreak of World War II, he split with Gandhi over the latter's insistence on nonviolent resistance in the event of a Japanese invasion. After the Congress party issued a mass call for a large-scale civil disobedience movement on Aug. 8, 1942, the British authorities arrested Nehru and other nationalist leaders. During his imprisonment at Ahmadnagar fort, Nehru wrote *The Discovery of India* (publ. 1946), a distinguished historical work. He was released on June 14, 1945, and took a leading part in negotiations with the British cabinet mission in New Delhi in March 1946. The following May, he was elected president of the Congress party and later head of the first all-Indian Executive council (the "caretaker government").

Nehru at first refused to participate in the British cabinet's proposed emergency meeting in London in the late winter of 1946, but later reconsidered and attended the conference after receiving assurances that the independence plan would not be changed. He expressed disappointment over the results of the London mission, and on Dec. 13, 1946, he urged the new constituent assembly to pass a resolution proclaiming an Indian republic free of Great Britain.

Nepal. An independent kingdom lying between India and Tibet and including Mt. Everest. Area: c. 54,000 sq.mi.; pop. (est.): 5,600,000. Capital: Kathmandu (pop. c. 108,800). Sovereign: Tribhubana Bir Bikram. Prime minister: General Sir Padma Shumshere Jung Bahadur Rana.

History.—On Nov. 29, 1945, Sir Joodha Shumshere Jung Bahadur Rana, prime minister from 1932, retired and was succeeded by his nephew, General Sir Padma Shumshere Jung Bahadur Rana. The former prime minister was an enlightened ruler, and the author of many reforms. Nepal contributed generously to World War II. A Nepalese force of nine battalions went on active service, and won ten Victoria crosses. The number of Gurkha battalions in the Indian army was increased from 20 to 40. The viceroy, Lord Archibald Wavell, visited Nepal in January. (H. G. R.N.)

Nervous System. More experimental work with streptomycin sulphate (an antibacterial substance) was done in 1946 and it was found to be of benefit in meningitis especially when the germs causing it were gram negative bacilli or streptococci.

Alcoholism.—Many persons suffering from alcoholism were given regular lectures, as a group, and were permitted to associate and mingle with each other. This type of treatment proved valuable only to those patients who were able to quit drinking for eight weeks but was not efficacious to those who could not resist the temptation to go back to imbibitions after the eight weeks. Apparently during this period the patient had great difficulty in maintaining his adjustment. The observer felt that the opportunity of presenting other patients who had maintained abstinence after the eight weeks and survived had a salutary influence on his group of patients.

Psychotherapy.—Dr. John C. Whitehorn said the physician needed to develop respect and understanding of the human being as a pathogenic organism and to gain familiarity with the

common ways in which people defeated themselves. It was essential for the physician to recognize and respect the patient's personality as the most powerful biological agent available for treatment. Finally the physician must serve as a strategic aid to the patient in liberating and developing the patient's own resources for more satisfactory modes of adjustment.

Psychoneurosis.—In 1944, industry and almost everyone else were given to understand that many discharged veterans of World War II were neurotics, "screwballs," etc. As a result of this Dr. C. C. Burlingame was asked to make a study and investigation to determine ways of protecting industry's equipment and employees. The author stated that the greater percentage of men discharged from the armed forces as psychoneurotics never left the continental United States. In civilian life they would not have been labelled as psychoneurotic and would not have needed a doctor's treatment. The root of the whole problem was due to the fact that these people were essentially not good soldier material but had been perfectly good civilian material. The vast majority of these men who had a good work record and were not in combat should offer no great problem in readjustment. The author felt that those who did very well in the army and were the best in combat might need the help of a psychiatrist.

Netherlands. A kingdom of northwest Europe, bounded N. and W. by the North sea, E. by Germany and S. by Belgium. Area: 12,742 sq.mi.; pop. (est. Oct. 1, 1946): 9,479,000. Chief towns (pop. est. Dec. 31, 1942): Amsterdam (cap., 790,900); Rotterdam (616,910); The Hague (seat of government, 507,351). Language: Dutch; religion: Christian (1930 census, Dutch Reformed Church 2,732,333; Roman Catholic 2,890,022). Ruler: Queen Wilhelmina; prime minister (1946): Dr. L. J. M. Beel.

History.—When they celebrated the first anniversary of liberation on May 4, 1946, the Dutch people were able to look back on a year of remarkable achievements. The starvation of May 1945 had been replaced by a diet of at least 2,500 calories per day. In the Wieringmeer Polder, flooded by the Germans in April 1945, promising crops were growing. Walcheren, flooded by the royal air force in 1944, had been drained and the dykes repaired by Dec. 1945. Of the 285,000 damaged houses, 230,000 had been made habitable and 2,000 temporary houses had been built in the first 3 mo. of 1946. By Aug. 1946 the Moerdijk railway bridge was repaired, thus re-establishing the direct route between Holland and Brabant. Electric trains were running between all the large northern towns. By Sept. 1946 coal production had increased to more than 33,000 (short) tons per day, 69% of prewar production.

Elections for the Dutch parliament were held on May 17, 1946. The result was a majority for the Roman Catholic party which won 32 seats; the Social Democrats were second with 29. A Catholic-Social Democrat cabinet was formed on July 2 under the leadership of Dr. Beel (Catholic).

Dr. E. N. van Kleffens led the delegation at the first general assembly of the United Nations during 1946, and the minister of foreign affairs, Baron van Boetzelaer van Oosterhout, at the second. The latter also led the Dutch delegation to the Paris peace conference.

In September a commission general of three, led by the previous prime minister, Prof. W. Schermerhorn, went to the Netherlands Indies to consider with Dr. H. J. van Mook, lieutenant governor general of the N.I., and the republican leaders, the

constitutional relationship of the N.I. with the Netherlands. A draft agreement was there drawn up, recognizing the republic and planning the United States of Indonesia; the agreement was ratified in the Netherlands parliament on Dec. 20. (G. J. R.)

Education.—In 1938: elementary schools 7,812, scholars 1,242,778; secondary schools 288, scholars 62,301; high schools (1937-38) 4, scholars 3,037; universities (1937-38) 6, students 9,471.

Finance.—Revenue (est. 1946-47) 2,598,976,684 guilders (ordinary: 2,401,141,856 guilders); expenditure (est. 1946-47) 4,250,093,693 guilders (ordinary: 2,310,358,329); public debt (March 1944) 14,947,368,400 guilders; exchange rate (1946): 1 guilder=38 U.S. cents.

Trade and Communication.—Foreign trade (merchandise): imports (first 10 mo. of 1946) 1,650,000,000 guilders; exports (first 11 mo. of 1946) 660,000,000. Communications and transport (1938): roads suitable for motor traffic 8,534 mi.; railways open to traffic 2,278 mi.; rivers and canals, navigable, 4,817 mi.; airways, distance flown, 6,629,000 mi.; shipping (June 30) 2,855,400 gross tons; launched (July 1938-June 1939) 246,400 gross tons; entered with cargoes 27,606,524 net tons; cleared with cargoes 23,151,428 net tons; motor vehicles licensed (Aug. 1, 1938): cars 94,000; buses 4,088; trucks 50,988; cycles 55,140; wireless (June 30, 1939): registered receiving sets 839,542; connections with radio-distribution systems 368,710.

Agriculture, Manufactures, Mineral Production.—Exports, 1946 (first 11 mo.): agricultural 318,000,000 guilders, industrial 342,000,000 guilders. Production (harvest 1946), in short tons: wheat 385,000; rye 495,000; barley 192,500; oats 462,000; pulse 88,000; flax 60,500; potatoes 4,543,000. Minerals (1939) in short tons: coal 14,147,000; zinc 22,550; salt 219,780; pig iron and ferro alloys (1938) 304,260. (See also CURAÇAO; NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES; SURINAM.)
